Wound infection may take place from catgut which has not been efficiently prepared. The local and general reactions may be slight, and, as a rule, do not appear for seven or eight days after the operation, and, it may be, not till after the skin edges have united. The suppuration is strictly localised to the part of the wound where catgut was employed for stitches or ligatures, and shows little tendency to spread. The infected part, however, is often long of healing. The irritation in these cases is probably due to toxins in the catgut and not to bacteria.

When suppuration occurs in connection with buried sutures of unabsorbable materials, such as silk, silkworm gut, or silver wire, it is apt to persist till the foreign material is cast off or removed.

Suppuration may occur in the track of a skin stitch, producing a stitch abscess. The infection may arise from the material used, especially catgut or silk, or, more frequently perhaps, from the growth of staphylococcus albus from the skin of the patient when this has been imperfectly disinfected. The formation of pus under these conditions may not be attended with any of the usual signs of suppuration, and beyond some induration around the wound and a slight tenderness on pressure there may be nothing to suggest the presence of an abscess.

Acute Suppuration of a Mucous Membrane.--When pyogenic organisms gain access to a mucous membrane, such as that of the bladder, urethra, or middle ear, the usual phenomena of acute inflammation and suppuration ensue, followed by the discharge of pus on the free surface. It would appear that the most marked changes take place in the submucous tissue, causing the covering epithelium in places to die and leave small superficial ulcers, for example in gonorrhoeal urethritis, the cicatricial contraction of the scar subsequently leading to the formation of stricture. When mucous glands are present in the membrane, the pus is mixed with mucus--muco-pus.

DIFFUSE CELLULITIS AND DIFFUSE SUPPURATION

Cellulitis is an acute affection resulting from the introduction of some organism--commonly the streptococcus pyogenes--into the cellular connective tissue of the integument, intermuscular septa, tendon sheaths, or other structures. Infection always takes place through a breach of the surface, although this may be superficial and

insignificant, such as a pin-prick, a scratch, or a crack under a nail, and the wound may have been healed for some time before the inflammation becomes manifest. The cellulitis, also, may develop at some distance from the seat of inoculation, the organisms having travelled by the lymphatics.

The virulence of the organisms, the loose, open nature of the tissues in which they develop, and the free lymphatic circulation by means of which they are spread, account for the diffuse nature of the process.

Sometimes numbers of cocci are carried for a considerable distance from the primary area before they are arrested in the lymphatics, and thus several patches of inflammation may appear with healthy areas between.

The pus infiltrates the meshes of the cellular tissue, there is sloughing of considerable portions of tissue of low vitality, such as fat, fascia, or tendon, and if the process continues for some time several collections of pus may form.

Clinical Features.--The reaction in cases of diffuse cellulitis is severe, and is usually ushered in by a distinct chill or even a rigor, while the temperature rises to 103°, 104°, or 105° F. The pulse is proportionately increased in frequency, and is small, feeble, and often irregular. The face is flushed, the tongue dry and brown, and the patient may become delirious, especially during the night. Leucocytosis is present in cases of moderate severity; but in severe cases the virulence of the toxins prevents reaction taking place, and leucocytosis is absent.

The local manifestations vary with the relation of the seat of the inflammation to the surface. When the superficial cellular tissue is involved, the skin assumes a dark bluish-red colour, is swollen, oedematous, and the seat of burning pain. To the touch it is firm, hot, and tender. When the primary focus is in the deeper tissues, the constitutional disturbance is aggravated, while the local signs are delayed, and only become prominent when pus forms and approaches the surface. It is not uncommon for blebs containing dark serous fluid to form on the skin. The infection frequently spreads along the line of the main lymph vessels of the part (septic lymphangitis) and may reach the lymph glands (septic lymphadenitis).

With the formation of pus the skin becomes soft and boggy at several points, and eventually breaks, giving exit to a quantity of thick grumous discharge. Sometimes several small collections under the skin fuse, and an abscess is formed in which fluctuation can be detected. Occasionally gases are evolved in the tissues, giving rise to emphysema. It is common for portions of fascia, ligaments, or tendons to slough, and this may often be recognised clinically by a peculiar crunching or grating sensation transmitted to the fingers on making firm pressure on the part.

If it is not let out by incision, the pus, travelling along the lines of least resistance, tends to point at several places on the surface, or to open into joints or other cavities.

Prognosis.--The occurrence of septicaemia is the most serious risk, and it is in cases of diffuse suppurative cellulitis that this form of blood-poisoning assumes its most aggravated forms. The toxins of the streptococci are exceedingly virulent, and induce local death of tissue so rapidly that the protective emigration of leucocytes fails to take place. In some cases the passage of masses of free cocci in the lymphatics, or of infective emboli in the blood vessels, leads to the formation of pyogenic abscesses in vital organs, such as the brain, lungs, liver, kidneys, or other viscera. Haemorrhage from erosion of arterial or venous trunks may take place and endanger life.

Treatment.--The treatment of diffuse cellulitis depends to a large extent on the situation and extent of the affected area, and on the stage of the process.

In the limbs, for example, where the application of a constricting

band is practicable, Bier's method of inducing passive hyperaemia yields excellent results. If pus is formed, one or more small incisions are made and a light moist dressing placed over the wounds to absorb the discharge, but no drain is inserted. The whole of the inflamed area should be covered with gauze wrung out of a 1 in 10 solution of ichthylol in glycerine. The dressing is changed as often as necessary, and in the intervals when the band is off, gentle active and passive movements should be carried out to prevent the formation of adhesions. After incisions have been made, we have found the immersion of the limb, for a few hours at a time, in a water-bath containing warm boracic lotion or eusol a useful adjuvant to the passive hyperaemia.

Continuous irrigation of the part by a slow, steady stream of lotion, at the body temperature, such as eusol, or Dakin's solution, or boracic acid, or frequent washing with peroxide of hydrogen, has been found of value.

A suitably arranged splint adds to the comfort of the patient; and the limb should be placed in the attitude which, in the event of stiffness resulting, will least interfere with its usefulness. The elbow, for example, should be flexed to a little less than a right angle; at the wrist, the hand should be dorsiflexed and the fingers flexed slightly towards the palm.

Massage, passive movement, hot and cold douching, and other measures, may be necessary to get rid of the chronic oedema, adhesions of tendons, and stiffness of joints which sometimes remain.

In situations where a constricting band cannot be applied, for example, on the trunk or the neck, Klapp's suction bells may be used, small incisions being made to admit of the escape of pus.

If these measures fail or are impracticable, it may be necessary to make one or more free incisions, and to insert drainage-tubes, portions of rubber dam, or iodoform worsted.

The general treatment of toxæmia must be carried out, and in cases due to infection by streptococci, anti-streptococcic serum may be used.

In a few cases, amputation well above the seat of disease, by removing the source of toxin production, offers the only means of saving the patient.

WHITLOW

The clinical term whitlow is applied to an acute infection, usually followed by suppuration, commonly met with in the fingers, less frequently in the toes. The point of infection is often trivial--a pin-prick, a puncture caused by a splinter of wood, a scratch, or even an imperceptible lesion of the skin.

Several varieties of whitlow are recognised, but while it is convenient to describe them separately, it is to be clearly understood that clinically they merge one into another, and it is not always possible to determine in which connective-tissue plane a given infection has originated.

Initial Stage.--Attention is usually first attracted to the condition by a sensation of tightness in the finger and tenderness when the part is squeezed or knocked against anything. In the course of a few hours the part becomes red and swollen; there is continuous pain, which soon assumes a throbbing character, particularly when the hand is dependent, and may be so severe as to prevent sleep, and the patient may feel generally out of sorts.

If a constricting band is applied at this stage, the infection can usually be checked and the occurrence of suppuration prevented. If this fails, or if the condition is allowed to go untreated, the inflammatory reaction increases and terminates in suppuration, giving rise to one or

other of the forms of whitlow to be described.

The Purulent Blister.--In the most superficial variety, pus forms between the rete Malpighii and the stratum corneum of the skin, the latter being raised as a blister in which fluctuation can be detected (Fig. 9, a). This is commonly met with in the palm of the hand of labouring men who have recently resumed work after a spell of idleness. When the blister forms near the tip of the finger, the pus burrows under the nail--which corresponds to the stratum corneum--raising it from its bed.

There is some local heat and discolouration, and considerable pain and tenderness, but little or no constitutional disturbance. Superficial lymphangitis may extend a short distance up the forearm. By clipping away the raised epidermis, and if necessary the nail, the pus is allowed to escape, and healing speedily takes place.

Whitlow at the Nail Fold.--This variety, which is met with among those who handle septic material, occurs in the sulcus between the nail and the skin, and is due to the introduction of infective matter at the root of the nail (Fig. 9, b). A small focus of suppuration forms under the nail, with swelling and redness of the nail fold, causing intense pain and discomfort, interfering with sleep, and producing a constitutional reaction out of all proportion to the local lesion.

To allow the pus to escape, it is necessary, under local anaesthesia, to cut away the nail fold as well as the portion of nail in the infected area, or, it may be, to remove the nail entirely. If only a small opening is made in the nail it is apt to be blocked by granulations.

[Illustration: FIG. 9.--Diagram of various forms of Whitlow.

- a = Purulent blister.
- b = Suppuration at nail fold.
- c = Subcutaneous whitlow.
- d = Whitlow in sheath of flexor tendon (e).]

Subcutaneous Whitlow.--In this variety the infection manifests itself as a cellulitis of the pulp of the finger (Fig. 9, c), which sometimes spreads towards the palm of the hand. The finger becomes red, swollen, and tense; there is severe throbbing pain, which is usually worst at night and prevents sleep, and the part is extremely tender on pressure. When the palm is invaded there may be marked oedema of the back of the hand, the dense integument of the palm preventing the swelling from appearing on the front. The pus may be under such tension that fluctuation cannot be detected. The patient is usually able to flex the finger to a certain extent without increasing the pain--a point which indicates that the tendon sheaths have not been invaded. The suppurative process may, however, spread to the tendon sheaths, or even to the bone. Sometimes the excessive tension and virulent toxins induce actual gangrene of the distal part, or even of the whole finger. There is considerable constitutional disturbance, the temperature often reaching 101 ° or 102 ° F.

The treatment consists in applying a constriction band and making an incision over the centre of the most tender area, care being taken to avoid opening the tendon sheath lest the infection be conveyed to it. Moist dressings should be employed while the suppuration lasts. Carbolic fomentations, however, are to be avoided on account of the risk of inducing gangrene.

Whitlow of the Tendon Sheaths.--In this form the main incidence of the infection is on the sheaths of the flexor tendons, but it is not always possible to determine whether it started there or spread thither from the subcutaneous cellular tissue (Fig. 9, d). In some cases both connective tissue planes are involved. The affected finger becomes red, painful, and swollen, the swelling spreading to the dorsum. The involvement of the tendon sheath is usually indicated by the patient being unable to flex the finger, and by the pain being increased when he attempts to do so. On account of the anatomical arrangement of the tendon sheaths, the process may spread into the forearm--directly in the

case of the thumb and little finger, and after invading the palm in the case of the other fingers--and there give rise to a diffuse cellulitis which may result in sloughing of fasciae and tendons. When the infection spreads into the common flexor sheath under the transverse carpal (anterior annular) ligament, it is not uncommon for the intercarpal and wrist joints to become implicated. Impaired movement of tendons and joints is, therefore, a common sequel to this variety of whitlow.

The treatment consists in inducing passive hyperaemia by Bier's method, and, if this is done early, suppuration may be avoided. If pus forms, small incisions are made, under local anaesthesia, to relieve the tension in the sheath and to diminish the risk of the tendons sloughing. No form of drain should be inserted. In the fingers the incisions should be made in the middle line, and in the palm they should be made over the metacarpal bones to avoid the digital vessels and nerves. If pus has spread under the transverse carpal ligament, the incision must be made above the wrist. Passive movements and massage must be commenced as early as possible and be perseveringly employed to diminish the formation of adhesions and resulting stiffness.

Subperiosteal Whitlow.--This form is usually an extension of the subcutaneous or of the thecal variety, but in some cases the inflammation begins in the periosteum--usually of the terminal phalanx. It may lead to necrosis of a portion or even of the entire phalanx. This is usually recognised by the persistence of suppuration long after the acute symptoms have passed off, and by feeling bare bone with the probe. In such cases one or more of the joints are usually implicated also, and lateral mobility and grating may be elicited. Recovery does not take place until the dead bone is removed, and the usefulness of the finger is often seriously impaired by fibrous or bony ankylosis of the interphalangeal joints. This may render amputation advisable when a stiff finger is likely to interfere with the patient's occupation.

SUPPURATIVE CELLULITIS IN DIFFERENT SITUATIONS

Cellulitis of the forearm is usually a sequel to one of the deeper varieties of whitlow.

In the region of the elbow-joint, cellulitis is common around the olecranon. It may originate as an inflammation of the olecranon bursa, or may invade the bursa secondarily. In exceptional cases the elbow-joint is also involved.

Cellulitis of the axilla may originate in suppuration in the lymph glands, following an infected wound of the hand, or it may spread from a septic wound on the chest wall or in the neck. In some cases it is impossible to discover the primary seat of infection. A firm, brawny swelling forms in the armpit and extends on to the chest wall. It is attended with great pain, which is increased on moving the arm, and there is marked constitutional disturbance. When suppuration occurs, its spread is limited by the attachments of the axillary fascia, and the pus tends to burrow on to the chest wall beneath the pectoral muscles, and upwards towards the shoulder-joint, which may become infected. When the pus forms in the axillary space, the treatment consists in making free incisions, which should be placed on the thoracic side of the axilla to avoid the axillary vessels and nerves. If the pus spreads on to the chest wall, the abscess should be opened below the clavicle by Hilton's method, and a counter opening may be made in the axilla.

Cellulitis of the sole of the foot may follow whitlow of the toes.

In the region of the ankle cellulitis is not common; but around the knee it frequently occurs in relation to the prepatellar bursa and to the popliteal lymph glands, and may endanger the knee-joint. It is also met with in the groin following on inflammation and suppuration of the inguinal glands, and cases are recorded in which the sloughing process has implicated the femoral vessels and led to secondary haemorrhage.

Cellulitis of the scalp, orbit, neck, pelvis, and perineum will be

considered with the diseases of these regions.

CHRONIC SUPPURATION

While it is true that a chronic pyogenic abscess is sometimes met with--for example, in the breast and in the marrow of long bones--in the great majority of instances the formation of a chronic or cold abscess is the result of the action of the tubercle bacillus. It is therefore more convenient to study this form of suppuration with tuberculosis (p. 139).

SINUS AND FISTULA

#Sinus.#--A sinus is a track leading from a focus of suppuration to a cutaneous or mucous surface. It usually represents the path by which the discharge escapes from an abscess cavity that has been prevented from closing completely, either from mechanical causes or from the persistent formation of discharge which must find an exit. A sinus is lined by granulation tissue, and when it is of long standing the opening may be dragged below the level of the surrounding skin by contraction of the scar tissue around it. As a sinus will persist until the obstacle to closure of the original abscess is removed, it is necessary that this should be sought for. It may be a foreign body, such as a piece of dead bone, an infected ligature, or a bullet, acting mechanically or by keeping up discharge, and if the body is removed the sinus usually heals. The presence of a foreign body is often suggested by a mass of redundant granulations at the mouth of the sinus. If a sinus passes through a muscle, the repeated contractions tend to prevent healing until the muscle is kept at rest by a splint, or put out of action by division of its fibres. The sinuses associated with empyema are prevented from healing by the rigidity of the chest wall, and will only close after an operation which admits of the cavity being obliterated. In any case it is necessary to disinfect the track, and, it may be, to remove the unhealthy granulations lining it, by means of the sharp spoon, or to excise it bodily. To encourage healing from the bottom the cavity should be packed with bismuth or iodoform gauze. The healing of long and tortuous sinuses is often hastened by the injection of Beck's bismuth paste (p. 145). If disfigurement is likely to follow from cicatricial contraction--for example, in a sinus over the lower jaw associated with a carious tooth--the sinus should be excised and the raw surfaces approximated with stitches.

The tuberculous sinus is described under Tuberculosis.

A #fistula# is an abnormal canal passing from a mucous surface to the skin or to another mucous surface. Fistulae resulting from suppuration usually occur near the natural openings of mucous canals--for example, on the cheek, as a salivary fistula; beside the inner angle of the eye, as a lacrymal fistula; near the ear, as a mastoid fistula; or close to the anus, as a fistula-in-ano. Intestinal fistulae are sometimes met with in the abdominal wall after strangulated hernia, operations for appendicitis, tuberculous peritonitis, and other conditions. In the perineum, fistulae frequently complicate stricture of the urethra.

Fistulae also occur between the bladder and vagina (vesico-vaginal fistula), or between the bladder and the rectum (recto-vesical fistula).

The treatment of these various forms of fistula will be described in the sections dealing with the regions in which they occur.

Congenital fistulae, such as occur in the neck from imperfect closure of branchial clefts, or in the abdomen from unobliterated foetal ducts such as the urachus or Meckel's diverticulum, will be described in their proper places.

CONSTITUTIONAL MANIFESTATIONS OF PYOGENIC INFECTION

We have here to consider under the terms Sapraemia, Septicaemia, and Pyaemia certain general effects of pyogenic infection, which, although their clinical manifestations may vary, are all associated with the action of the same forms of bacteria. They may occur separately or in combination, or one may follow on and merge into another.

#Sapraemia#, or septic intoxication, is the name applied to a form of poisoning resulting from the absorption into the blood of the toxic products of pyogenic bacteria. These products, which are of the nature of alkaloids, act immediately on their entrance into the circulation, and produce effects in direct proportion to the amount absorbed. As the toxins are gradually eliminated from the body the symptoms abate, and if no more are introduced they disappear. Sapraemia in these respects, therefore, is comparable to poisoning by any other form of alkaloid, such as strychnin or morphin.

Clinical Features.--The symptoms of sapraemia seldom manifest themselves within twenty-four hours of an operation or injury, because it takes some time for the bacteria to produce a sufficient dose of their poisons. The onset of the condition is marked by a feeling of chilliness, sometimes amounting to a rigor, and a rise of temperature to 102 o, 103 o, or 104 o F., with morning remissions (Fig. 10). The heart's action is markedly depressed, and the pulse is soft and compressible. The appetite is lost, the tongue dry and covered with a thin brownish-red fur, so that it has the appearance of "dried beef." The urine is scanty and loaded with urates. In severe cases diarrhoea and vomiting of dark coffee-ground material are often prominent features. Death is usually impending when the skin becomes cold and clammy, the mucous membranes livid, the pulse feeble and fluttering, the discharges involuntary, and when a low form of muttering delirium is present.

[Illustration: FIG. 10.--Charts of Acute sapraemia from (a) case of crushed foot, and (b) case of incomplete abortion.]

A local form of septic infection is always present--it may be an abscess, an infected compound fracture, or an infection of the cavity of the uterus, for example, from a retained portion of placenta.

Treatment.--The first indication is the immediate and complete removal of the infected material. The wound must be freely opened, all blood-clot, discharge, or necrosed tissue removed, and the area disinfected by washing with sterilised salt solution, peroxide of hydrogen, or eusol. Stronger lotions are to be avoided as being likely to depress the tissues, and so interfere with protective phagocytosis. On account of its power of neutralising toxins, iodoform is useful in these cases, and is best employed by packing the wound with iodoform gauze, and treating it by the open method, if this is possible.

The general treatment is carried out on the same lines as for other infective conditions.

#Chronic sapraemia or Hectic Fever.#--Hectic fever differs from acute sapraemia merely in degree. It usually occurs in connection with tuberculous conditions, such as bone or joint disease, psoas abscess, or empyema, which have opened externally, and have thereby become infected with pyogenic organisms. It is gradual in its development, and is of a mild type throughout.

[Illustration: FIG. 11.--Chart of Hectic Fever.]

The pulse is small, feeble, and compressible, and the temperature rises in the afternoon or evening to 102 o or 103 o F. (Fig. 11), the cheeks becoming characteristically flushed. In the early morning the temperature falls to normal or below it, and the patient breaks into a profuse perspiration, which leaves him pale, weak, and exhausted. He becomes rapidly and markedly emaciated, even although in some cases the appetite remains good and is even voracious.

The poisons circulating in the blood produce waxy degeneration in

certain viscera, notably the liver, spleen, kidneys, and intestines. The process begins in the arterial walls, and spreads thence to the connective-tissue structures, causing marked enlargement of the affected organs. Albuminuria, ascites, oedema of the lower limbs, clubbing of the fingers, and diarrhoea are among the most prominent symptoms of this condition.

The prognosis in hectic fever depends on the completeness with which the further absorption of toxins can be prevented. In many cases this can only be effected by an operation which provides for free drainage, and, if possible, the removal of infected tissues. The resulting wound is best treated by the open method. Even advanced waxy degeneration does not contra-indicate this line of treatment, as the diseased organs usually recover if the focus from which absorption of toxic material is taking place is completely eradicated.

[Illustration: FIG. 12---Chart of case of Septicaemia followed by Pyaemia.]

#Septicaemia.---This form of blood-poisoning is the result of the action of pyogenic bacteria, which not only produce their toxins at the primary seat of infection, but themselves enter the blood-stream and are carried to other parts, where they settle and produce further effects.

Clinical Features.---There may be an incubation period of some hours between the infection and the first manifestation of acute septicaemia. In such conditions as acute osteomyelitis or acute peritonitis, we see the most typical clinical pictures of this condition. The onset is marked by a chill, or a rigor, which may be repeated, while the temperature rises to 103° or 104° F., although in very severe cases the temperature may remain subnormal throughout, the virulence of the toxins preventing reaction. It is in the general appearance of the patient and in the condition of the pulse that we have our best guides as to the severity of the condition. If the pulse remains firm, full, and regular, and does not exceed 110 or even 120, while the temperature is moderately raised, the outlook is hopeful; but when the pulse becomes small and compressible, and reaches 130 or more, especially if at the same time the temperature is low, a grave prognosis is indicated. The tongue is often dry and coated with a black crust down the centre, while the sides are red. It is a good omen when the tongue becomes moist again. Thirst is most distressing, especially in septicaemia of intestinal origin. Persistent vomiting of dark-brown material is often present, and diarrhoea with blood-stained stools is not uncommon. The urine is small in amount, and contains a large proportion of urates. As the poisons accumulate, the respiration becomes shallow and laboured, the face of a dull ashy grey, the nose pinched, and the skin cold and clammy. Capillary haemorrhages sometimes take place in the skin or mucous membranes; and in a certain proportion of cases cutaneous eruptions simulating those of scarlet fever or measles appear, and are apt to lead to errors in diagnosis. In other cases there is slight jaundice. The mental state is often one of complete apathy, the patient failing to realise the gravity of his condition; sometimes there is delirium.

The prognosis is always grave, and depends on the possibility of completely eradicating the focus of infection, and on the reserve force the patient has to carry him over the period during which he is eliminating the poison already circulating in his blood.

The treatment is carried out on the same lines as in sapraemia, but it is less likely to be successful owing to the organisms having entered the circulation. When possible, the primary focus of infection should be dealt with.

#Pyaemia# is a form of blood-poisoning characterised by the development of secondary foci of suppuration in different parts of the body. Toxins are thus introduced into the blood, not only at the primary seat of infection, but also from each of these metastatic collections. Like septicaemia, this condition is due to pyogenic bacteria, the streptococcus pyogenes being the commonest organism found. The primary infection is usually in a wound--for example, a compound fracture--but

cases occur in which the point of entrance of the bacteria is not discoverable. The dissemination of the organisms takes place through the medium of infected emboli which form in a thrombosed vein in the vicinity of the original lesion, and, breaking loose, are carried thence in the blood-stream. These emboli lodge in the minute vessels of the lungs, spleen, liver, kidneys, pleura, brain, synovial membranes, or cellular tissue, and the bacteria they contain give rise to secondary foci of suppuration. Secondary abscesses are thus formed in those parts, and these in turn may be the starting-point of new emboli which give rise to fresh areas of pus formation. The organs above named are the commonest situations of pyaemic abscesses, but these may also occur in the bone marrow, the substance of muscles, the heart and pericardium, lymph glands, subcutaneous tissue, or, in fact, in any tissue of the body. Organisms circulating in the blood are prone to lodge on the valves of the heart and give rise to endocarditis.

[Illustration: FIG. 13---Chart of Pyaemia following on Acute Osteomyelitis.]

Clinical Features.--Before antiseptic surgery was practised, pyaemia was a common complication of wounds. In the present day it is not only infinitely less common, but appears also to be of a less severe type. Its rarity and its mildness may be related as cause and effect, because it was formerly found that pyaemia contracted from a pyaemic patient was more virulent than that from other sources.

In contrast with sapraemia and septicaemia, pyaemia is late of developing, and it seldom begins within a week of the primary infection. The first sign is a feeling of chilliness, or a violent rigor lasting for perhaps half an hour, during which time the temperature rises to 103°, 104°, or 105° F. In the course of an hour it begins to fall again, and the patient breaks into a profuse sweat. The temperature may fall several degrees, but seldom reaches the normal. In a few days there is a second rigor with rise of temperature, and another remission, and such attacks may be repeated at diminishing intervals during the course of the illness (Figs. 12 and 13). The pulse is soft, and tends to remain abnormally rapid even when the temperature falls nearly to normal.

The face is flushed, and wears a drawn, anxious expression, and the eyes are bright. A characteristic sweetish odour, which has been compared to that of new-mown hay, can be detected in the breath and may pervade the patient. The appetite is lost; there may be sickness and vomiting and profuse diarrhoea; and the patient emaciates rapidly. The skin is continuously hot, and has often a peculiar pungent feel. Patches of erythema sometimes appear scattered over the body. The skin may assume a dull sallow or earthy hue, or a bright yellow icteric tint may appear. The conjunctivae also may be yellow. In the latter stages of the disease the pulse becomes small and fluttering; the tongue becomes dry and brown; sordes collect on the teeth; and a low muttering form of delirium supervenes.

Secondary infection of the parotid gland frequently occurs, and gives rise to a suppurative parotitis. This condition is associated with severe pain, gradually extending from behind the angle of the jaw on to the face. There is also swelling over the gland, and eventually suppuration and sloughing of the gland tissue and overlying skin.

Secondary abscesses in the lymph glands, subcutaneous tissue, or joints are often so insidious and painless in their development that they are only discovered accidentally. When the abscess is evacuated, healing often takes place with remarkable rapidity, and with little impairment of function.

The general symptoms may be simulated by an attack of malaria.

Prognosis.--The prognosis in acute pyaemia is much less hopeless than it once was, a considerable proportion of the patients recovering. In acute cases the disease proves fatal in ten days or a fortnight, death being due to toxæmia. Chronic cases often run a long course, lasting for weeks or even months, and prove fatal from exhaustion and waxy disease

following on prolonged suppuration.

Treatment.--In such conditions as compound fractures and severe lacerated wounds, much can be done to avert the conditions which lead to pyaemia, by applying a Bier's constricting bandage as soon as there is evidence of infection having taken place, or even if there is reason to suspect that the wound is not aseptic.

If sepsis is already established, and evidence of general infection is present, the wound should be opened up sufficiently to admit of thorough disinfection and drainage, and the constricting bandage applied to aid the defensive processes going on in the tissues. If these measures fail, amputation of the limb may be the only means of preventing further dissemination of infective material from the primary source of infection.

Attempts have been made to interrupt the channel along which the infective emboli spread, by ligating or resecting the main vein of the affected part, but this is seldom feasible except in the case of the internal jugular vein for infection of the transverse sinus.

Secondary abscesses must be aspirated or opened and drained whenever possible.

The general treatment is conducted on the same lines as on other forms of pyogenic infection.

CHAPTER V

ULCERATION AND ULCERS

Definitions--Clinical examination of an ulcer--The healing sore.--Classification of ulcers--A. According to cause:
Traumatism, Imperfect circulation, Imperfect nerve-supply,
Constitutional causes--B. According to condition: Healing,
Stationary, Spreading--Treatment.

The process of ulceration may be defined as the molecular or cellular death of tissue taking place on a free surface. It is essentially of the same nature as the process of suppuration, only that the purulent discharge, instead of collecting in a closed cavity and forming an abscess, at once escapes on the surface.

An ulcer is an open wound or sore in which there are present certain conditions tending to prevent it undergoing the natural process of repair. Of these, one of the most important is the presence of pathogenic bacteria, which by their action not only prevent healing, but so irritate and destroy the tissues as to lead to an actual increase in the size of the sore. Interference with the nutrition of a part by oedema or chronic venous congestion may impede healing; as may also induration of the surrounding area, by preventing the contraction which is such an important factor in repair. Defective innervation, such as occurs in injuries and diseases of the spinal cord, also plays an important part in delaying repair. In certain constitutional conditions, too--for example, Bright's disease, diabetes, or syphilis--the vitiated state of the tissues is an impediment to repair. Mechanical causes, such as unsuitable dressings or ill-fitting appliances, may also act in the same direction.

#Clinical Examination of an Ulcer.#--In examining any ulcer, we observe--(1) Its base or floor, noting the presence or absence of granulations, their disposition, size, colour, vascularity, and whether they are depressed or elevated in relation to the surrounding parts. (2) The discharge as to quantity, consistence, colour, composition, and odour. (3) The edges, noting particularly whether or not the marginal epithelium is attempting to grow over the surface; also their shape,

regularity, thickness, and whether undermined or overlapping, everted or depressed. (4) The surrounding tissues, as to whether they are congested, oedematous, inflamed, indurated, or otherwise. (5) Whether or not there is pain or tenderness in the raw surface or its surroundings. (6) The part of the body on which it occurs, because certain ulcers have special seats of election--for example, the varicose ulcer in the lower third of the leg, the perforating ulcer on the sole of the foot, and so on.

#The Healing Sore.--If a portion of skin be excised aseptically, and no attempt made to close the wound, the raw surface left is soon covered over with a layer of coagulated blood and lymph. In the course of a few days this is replaced by the growth of granulations, which are of uniform size, of a pinkish-red colour, and moist with a slight serous exudate containing a few dead leucocytes. They grow until they reach the level of the surrounding skin, and so fill the gap with a fine velvety mass of granulation tissue. At the edges, the young epithelium may be seen spreading in over the granulations as a fine bluish-white pellicle, which gradually covers the sore, becoming paler in colour as it thickens, and eventually forming the smooth, non-vascular covering of the cicatrix. There is no pain, and the surrounding parts are healthy.

This may be used as a type with which to compare the ulcers seen at the bedside, so that we may determine how far, and in what particulars, these differ from the type; and that we may in addition recognise the conditions that have to be counteracted before the characters of the typical healing sore are assumed.

For purposes of contrast we may indicate the characters of an open sore in which bacterial infection with pathogenic bacteria has taken place. The layer of coagulated blood and lymph becomes liquefied and is thrown off, and instead of granulations being formed, the tissues exposed on the floor of the ulcer are destroyed by the bacterial toxins, with the formation of minute sloughs and a quantity of pus.

The discharge is profuse, thin, acrid, and offensive, and consists of pus, broken-down blood-clot, and sloughs. The edges are inflamed, irregular, and ragged, showing no sign of growing epithelium--on the contrary, the sore may be actually increasing in area by the breaking-down of the tissues at its margins. The surrounding parts are hot, red, swollen, and oedematous; and there is pain and tenderness both in the sore itself and in the parts around.

#Classification of Ulcers.--The nomenclature of ulcers is much involved and gives rise to great confusion, chiefly for the reason that no one basis of classification has been adopted. Thus some ulcers are named according to the causes at work in producing or maintaining them--for example, the traumatic, the septic, and the varicose ulcer; some from the constitutional element present, as the gouty and the diabetic ulcer; and others according to the condition in which they happen to be when seen by the surgeon, such as the weak, the inflamed, and the callous ulcer.

So long as we retain these names it will be impossible to find a single basis for classification; and yet many of the terms are so descriptive and so generally understood that it is undesirable to abolish them. We must therefore remain content with a clinical arrangement of ulcers,--it cannot be called a classification,--considering any given ulcer from two points of view: first its cause, and second its present condition. This method of studying ulcers has the practical advantage that it furnishes us with the main indications for treatment as well as for diagnosis: the cause must be removed, and the condition so modified as to convert the ulcer into an aseptic healing sore.

A. #Arrangement of Ulcers according to their Cause.--Although any given ulcer may be due to a combination of causes, it is convenient to describe the following groups:

Ulcers due to Traumatism.--Traumatism in the form of a crush or bruise is a frequent cause of ulcer formation, acting either by

directly destroying the skin, or by so diminishing its vitality that it is rendered a suitable soil for bacteria. If these gain access, in the course of a few days the damaged area of skin becomes of a greyish colour, blebs form on it, and it undergoes necrosis, leaving an unhealthy raw surface when the slough separates.

Heat and prolonged exposure to the Rontgen rays or to radium emanations act in a similar way.

The pressure of improperly padded splints or other appliances may so far interfere with the circulation of the part pressed upon, that the skin sloughs, leaving an open sore. This is most liable to occur in patients who suffer from some nerve lesion--such as anterior poliomyelitis, or injury of the spinal cord or nerve-trunks.

Splint-pressure sores are usually situated over bony prominences, such as the malleoli, the condyles of the femur or humerus, the head of the fibula, the dorsum of the foot, or the base of the fifth metatarsal bone. On removing the splint, the skin of the part pressed upon is found to be of a red or pink colour, with a pale grey patch in the centre, which eventually sloughs and leaves an ulcer. Certain forms of bed-sore are also due to prolonged pressure.

Pressure sores are also known to have been produced artificially by malingerers and hysterical subjects.

[Illustration: FIG. 14.--Leg Ulcers associated with Varicose Veins and Pigmentation of the Skin.]

Ulcers due to Imperfect Circulation.--Imperfect circulation is an important causative factor in ulceration, especially when it is the venous return that is defective. This is best illustrated in the so-called leg ulcer, which occurs most frequently on the front and medial aspect of the lower third of the leg. At this point the anastomosis between the superficial and deep veins of the leg is less free than elsewhere, so that the extra stress thrown upon the surface veins interferes with the nutrition of the skin (Hilton). The importance of imperfect venous return in the causation of such ulcers is evidenced by the fact that as soon as the condition of the circulation is improved by confining the patient to bed and elevating the limb, the ulcer begins to heal, even although all methods of local treatment have hitherto proved ineffectual. In a considerable number of cases, but by no means in all, this form of ulcer is associated with the presence of varicose veins, and in such cases it is spoken of as the varicose ulcer (Fig. 14). The presence of varicose veins is frequently associated with a diffuse brownish or bluish pigmentation of the skin of the lower third of the leg, or with an obstinate form of dermatitis (varicose eczema), and the scratching or rubbing of the part is liable to cause a breach of the surface and permit of infection which leads to ulceration. Varicose ulcers may also originate from the bursting of a small peri-phlebitic abscess.

Varicose veins in immediate relation to the base of a large chronic ulcer usually become thrombosed, and in time are reduced to fibrous cords, and therefore in such cases haemorrhage is not a common complication. In smaller and more superficial ulcers, however, the destructive process is liable to implicate the wall of the vessel before the occurrence of thrombosis, and to lead to profuse and it may be dangerous bleeding.

These ulcers are at first small and superficial, but from want of care, from continued standing or walking, or from injudicious treatment, they gradually become larger and deeper. They are not infrequently multiple, and this, together with their depth, may lead to their being mistaken for ulcers due to syphilis. The base of the ulcer is covered with imperfectly formed, soft, oedematous granulations, which give off a thin sero-purulent discharge. The edges are slightly inflamed, and show no evidence of healing. The parts around are usually pigmented and slightly oedematous, and as a rule there is little pain. This variety of ulcer is particularly prone to pass into the condition known as callous.

In anaemic patients, especially young girls, ulcers are occasionally met with which have many of the clinical characters of those associated with imperfect venous return. They are slow to heal, and tend to pass into the condition known as weak.

Ulcers due to Interference with Nerve-Supply.--Any interference with the nerve-supply of the superficial tissues predisposes to ulceration. For example, trophic ulcers are liable to occur in injuries or diseases of the spinal cord, in cerebral paralysis, in limbs weakened by poliomyelitis, in ascending or peripheral neuritis, or after injuries of nerve-trunks.

The acute bed-sore is a rapidly progressing form of ulceration, often amounting to gangrene, of portions of skin exposed to pressure when their trophic nerve-supply has been interfered with.

[Illustration: FIG. 15.--Perforating Ulcers of Sole of Foot.

(From Photograph lent by Sir Montagu Cotterill.)]

The perforating ulcer of the foot is a peculiar type of sore which occurs in association with the different forms of peripheral neuritis, and with various lesions of the brain and spinal cord, such as general paralysis, locomotor ataxia, or syringo-myelia (Fig. 15). It also occurs in patients suffering from glycosuria, and is usually associated with arterio-sclerosis--local or general. Perforating ulcer is met with most frequently under the head of the metatarsal bone of the great toe. A callosity forms and suppuration occurs under it, the pus escaping through a small hole in the centre. The process slowly and gradually spreads deeper and deeper, till eventually the bone or joint is reached, and becomes implicated in the destructive process--hence the term "perforating ulcer." The flexor tendons are sometimes destroyed, the toe being dorsiflexed by the unopposed extensors. The depth of the track being so disproportionate to its superficial area, the condition closely simulates a tuberculous sinus, for which it is liable to be mistaken. The raw surface is absolutely insensitive, so that the probe can be freely employed without the patient even being aware of it or suffering the least discomfort--a significant fact in diagnosis. The cavity is filled with effete and decomposing epidermis, which has a most offensive odour. The chronic and intractable character of the ulcer is due to interference with the trophic nerve-supply of the parts, and to the fact that the epithelium of the skin grows in and lines the track leading down to the deepest part of the ulcer and so prevents closure. While they are commonest on the sole of the foot and other parts subjected to pressure, perforating ulcers are met with on the sides and dorsum of the foot and toes, on the hands, and on other parts where no pressure has been exerted.

The tuberculous ulcer, so often seen in the neck, in the vicinity of joints, or over the ribs and sternum, usually results from the bursting through the skin of a tuberculous abscess. The base is soft, pale, and covered with feeble granulations and grey shreddy sloughs. The edges are of a dull blue or purple colour, and gradually thin out towards their free margins, and in addition are characteristically undermined, so that a probe can be passed for some distance between the floor of the ulcer and the thinned-out edges. Thin, devitalised tags of skin often stretch from side to side of the ulcer. The outline is irregular; small perforations often occur through the skin, and a thin, watery discharge, containing grey shreds of tuberculous debris, escapes.

Bazin's Disease.--This term is applied to an affection of the skin and subcutaneous tissue which bears certain resemblances to tuberculosis. It is met with almost exclusively between the knee and the ankle, and it usually affects both legs. It is commonest in girls of delicate constitution, in whose family history there is evidence of a tuberculous taint. The patient often presents other lesions of a tuberculous character, notably enlarged cervical glands, and phlyctenular ophthalmia. The tubercle bacillus has rarely been found, but we have always observed characteristic epithelioid cells and giant cells in sections made from the edge or floor of the ulcer.

[Illustration: FIG. 16---Bazin's Disease in a girl aet. 16.]

The condition begins by the formation in the skin and subcutaneous tissue of dusky or livid nodules of induration, which soften and ulcerate, forming small open sores with ragged and undermined edges, not unlike those resulting from the breaking down of superficial syphilitic gummatous (Fig. 16). Fresh crops of nodules appear in the neighbourhood of the ulcers, and in turn break down. While in the nodular stage the affection is sometimes painful, but with the formation of the ulcer the pain subsides.

The disease runs a chronic course, and may slowly extend over a wide area in spite of the usual methods of treatment. After lasting for some months, or even years, however, it may eventually undergo spontaneous cure. The most satisfactory treatment is to excise the affected tissues and fill the gap with skin-grafts.

[Illustration: FIG. 17---Syphilitic Ulcers in region of Knee, showing punched-out appearance and raised indurated edges.]

The syphilitic ulcer is usually formed by the breaking down of a cutaneous or subcutaneous gumma in the tertiary stage of syphilis. When the gummatous tissue is first exposed by the destruction of the skin or mucous membrane covering it, it appears as a tough greyish slough, compared to "wash leather," which slowly separates and leaves a more or less circular, deep, punched-out gap which shows a few feeble unhealthy granulations and small sloughs on its floor. The edges are raised and indurated; and the discharge is thick, glairy, and peculiarly offensive. The parts around the ulcer are congested and of a dark brown colour. There are usually several such ulcers together, and as they tend to heal at one part while they spread at another, the affected area assumes a sinuous or serpiginous outline. Syphilitic ulcers may be met with in any part of the body, but are most frequent in the upper part of the leg (Fig. 17), especially around the knee-joint in women, and over the ribs and sternum. On healing, they usually leave a depressed and adherent cicatrix.

The scorbutic ulcer occurs in patients suffering from scurvy, and is characterised by its prominent granulations, which show a marked tendency to bleed, with the formation of clots, which dry and form a spongy crust on the surface.

In gouty patients small ulcers which are exceedingly irritable and painful are liable to occur.

Ulcers associated with Malignant Disease.--Cancer and sarcoma when situated in the subcutaneous tissue may destroy the overlying skin so that the substance of the tumour is exposed. The fungating masses thus produced are sometimes spoken of as malignant ulcers, but as they are essentially different in their nature from all other forms of ulcers, and call for totally different treatment, it is best to consider them along with the tumours with which they are associated. Rodent ulcer, which is one form of cancer of the skin, will be discussed with new growths of the skin.

B. #Arrangement of Ulcers according to their Condition.--Having arrived at an opinion as to the cause of a given ulcer, and placed it in one or other of the preceding groups, the next question to ask is, In what condition do I find this ulcer at the present moment?

Any ulcer is in one of three states--healing, stationary, or spreading; although it is not uncommon to find healing going on at one part while the destructive process is extending at another.

The Healing Condition.--The process of healing in an ulcer has already been studied, and we have learned that it takes place by the formation of granulation tissue, which becomes converted into connective tissue, and is covered over by epithelium growing in from the edges.

Those ulcers which are stationary--that is, neither healing nor spreading--may be in one of several conditions.

The Weak Condition.--Any ulcer may get into a weak state from receiving a blood supply which is defective either in quantity or in quality. The granulations are small and smooth, and of a pale yellow or grey colour, the discharge is small in amount, and consists of thin serum and a few pus cells, and as this dries on the edges it forms scabs which interfere with the growth of epithelium.

Should the part become oedematous, either from general causes, such as heart or kidney disease, or from local causes, such as varicose veins, the granulations share in the oedema, and there is an abundant serous discharge.

The excessive use of moist dressings leads to a third variety of weak ulcer--namely, one in which the granulations become large, soft, pale, and flabby, projecting beyond the level of the skin and overlapping the edges, which become pale and sodden. The term "proud flesh" is popularly applied to such redundant granulations.

[Illustration: FIG. 18.--Callous Ulcer, showing thickened edges and indurated swelling of surrounding parts.]

The Callous Condition.--This condition is usually met with in ulcers on the lower third of the leg, and is often associated with the presence of varicose veins. It is chiefly met with in hospital practice. The want of healing is mainly due to impeded venous return and to oedema and induration of the surrounding skin and cellular tissues (Fig. 18). The induration results from coagulation and partial organisation of the inflammatory effusion, and prevents the necessary contraction of the sore. The base of a callous ulcer lies at some distance below the level of the swollen, thickened, and white edges, and presents a glazed appearance, such granulations as are present being unhealthy and irregular. The discharge is usually watery, and cakes in the dressing. When from neglect and want of cleanliness the ulcer becomes inflamed, there is considerable pain, and the discharge is purulent and often offensive.

The prolonged hyperaemia of the tissues in relation to a callous ulcer of the leg often leads to changes in the underlying bones. The periosteum is abnormally thick and vascular, the superficial layers of the bone become injected and porous, and the bones, as a whole, are thickened. In the macerated bone "the surface is covered with irregular, stalactite-like processes or foliaceous masses, which, to a certain extent, follow the line of attachment of the interosseous membrane and of the intermuscular septa" (Cathcart) (Fig. 19). When the whole thickness of the soft tissues is destroyed by the ulcerative process, the area of bone that comes to form the base of the ulcer projects as a flat, porous node, which in its turn may be eroded. These changes as seen in the macerated specimen are often mistaken for disease originating in the bone.

[Illustration: FIG. 19.--Tibia and Fibula, showing changes due to chronic ulcer of leg.]

The irritable condition is met with in ulcers which occur, as a rule, just above the external malleolus in women of neurotic temperament. They are small in size and have prominent granulations, and by the aid of a probe points of excessive tenderness may be discovered. These, Hilton believed, correspond to exposed nerve filaments.

Ulcers which are spreading may be met with in one of several conditions.

The Inflamed Condition.--Any ulcer may become acutely inflamed from the access of fresh organisms, aided by mechanical irritation from trauma, ill-fitting splints or bandages, or want of rest, or from chemical irritants, such as strong antiseptics. The best clinical example of an inflamed ulcer is the venereal soft sore. The base of the

ulcer becomes red and angry-looking, the granulations disappear, and a copious discharge of thin yellow pus, mixed with blood, escapes. Sloughs of granulation tissue or of connective tissue may form. The edges become red, ragged, and everted, and the ulcer increases in size by spreading into the inflamed and oedematous surrounding tissues. Such ulcers are frequently multiple. Pain is a constant symptom, and is often severe, and there is usually some constitutional disturbance.

The phagedaenic condition is the result of an ulcer being infected with specially virulent bacteria. It occurs in syphilitic ulcers, and rapidly leads to a widespread destruction of tissue. It is also met with in the throat in some cases of scarlet fever, and may give rise to fatal haemorrhage by ulcerating into large blood vessels. All the local and constitutional signs of a severe septic infection are present.

#Treatment of Ulcers.--An ulcer is not only an immediate cause of suffering to the patient, crippling and incapacitating him for his work, but is a distinct and constant menace to his health: the prolonged discharge reduces his strength; the open sore is a possible source of infection by the organisms of suppuration, erysipelas, or other specific diseases; phlebitis, with formation of septic emboli, leading to pyaemia, is liable to occur; and in old persons it is not uncommon for ulcers of long standing to become the seat of cancer. In addition, the offensive odour of many ulcers renders the patient a source of annoyance and discomfort to others. The primary object of treatment in any ulcer is to bring it into the condition of a healing sore. When this has been effected, nature will do the rest, provided extraneous sources of irritation are excluded.

Steps must be taken to facilitate the venous return from the ulcerated part, and to ensure that a sufficient supply of fresh, healthy blood reaches it. The septic element must be eliminated by disinfecting the ulcer and its surroundings, and any other sources of irritation must be removed.

If the patient's health is below par, good nourishing food, tonics, and general hygienic treatment are indicated.

Management of a Healing Sore.--Perhaps the best dressing for a healing sore is a layer of Lister's perforated oiled-silk protective, which is made to cover the raw surface and the skin for about a quarter of an inch beyond the margins of the sore. Over this three or four thicknesses of sterilised gauze, wrung out of eusol, creolin, or sterilised water, are applied, and covered by a pad of absorbent wool. As far as possible the part should be kept at rest, and the position should be adjusted so as to favour the circulation in the affected area.

The dressing may be renewed at intervals, and care must be taken to avoid any rough handling of the sore. Any discharge that lies on the surface should be removed by a gentle stream of lotion rather than by wiping. The area round the sore should be cleansed before the fresh dressing is applied.

In some cases, healing goes on more rapidly under a dressing of weak boracic ointment (one-quarter the strength of the pharmacopoeial preparation). The growth of epithelium may be stimulated by a 6 to 8 per cent. ointment of scarlet-red.

Dusting powders and poultice dressings are best avoided in the treatment of healing sores.

In extensive ulcers resulting from recent burns, if the granulations are healthy and aseptic, skin-grafts may safely be placed on them directly. If, however, their asepticity cannot be relied upon, it is necessary to scrape away the superficial layer of the granulations, the young fibrous tissue underneath being conserved, as it is sufficiently vascular to nourish the grafts placed on it.

#Treatment of Special Varieties of Ulcers.--Before beginning to treat a given ulcer, two questions have to be answered--first, What are the

causative conditions present? and second, In what condition do I find the ulcer?--in other words, In what particulars does it differ from a healthy healing sore?

If the cause is a local one, it must be removed; if a constitutional one, means must be taken to counteract it. This done, the condition of the ulcer must be so modified as to bring it into the state of a healing sore, after which it will be managed on the lines already laid down.

#Treatment in relation to the Cause of the Ulcer.---_Traumatic Group._--The prophylaxis of these ulcers consists in excluding bacteria, by cleansing crushed or bruised parts, and applying sterilised dressings and properly adjusted splints. If there is reason to fear that the disinfection has not been complete, a Bier's constricting bandage should be applied for some hours each day. These measures will often prevent a grossly injured portion of skin dying, and will ensure asepticity should it do so. In the event of the skin giving way, the same form of dressing should be continued till the slough has separated and a healthy granulating surface is formed. The protective dressing appropriate to a healing sore is then substituted. Pressure sores are treated on the same lines.

The treatment of ulcers caused by burns and scalds will be described later.

In ulcers of the leg due to interference with the venous return, the primary indication is to elevate the limb in order to facilitate the flow of the blood in the veins, and so admit of fresh blood reaching the part. The limb may be placed on pillows, or the foot of the bed raised on blocks, so that the ulcer lies on a higher level than the heart. Should varicose veins be present, the question of operative treatment must be considered.

When an imperfect nerve supply is the main factor underlying ulcer formation, prophylaxis is the chief consideration. In patients suffering from spinal injuries or diseases, cerebral paralysis, or affections of the peripheral nerves, all sources of irritation, such as ill-fitting splints, tight bandages, moist applications, and hot bottles, should be avoided. Any part liable to pressure, from the position of the patient or otherwise, must be carefully protected by pads of wool, air-cushions, or water-bags, and must be kept absolutely dry. The skin should be hardened by daily applications of methylated spirit.

Should an ulcer form in spite of these precautions, the mildest antiseptics must be employed for bathing and dressing it, and as far as possible all dressings should be dry.

The perforating ulcer of the foot calls for special treatment. To avoid pressure on the sole of the foot, the patient must be confined to bed. As the main local obstacle to healing is the down-growth of epithelium along the sides of the ulcer, this must be removed by the knife or sharp spoon. The base also should be excised, and any bone which may have become involved should be gouged away, so as to leave a healthy and vascular surface. The cavity thus formed is stuffed with bismuth or iodoform gauze and encouraged to heal from the bottom. As the parts are insensitive an anaesthetic is not required. After the ulcer has healed, the patient should wear in his boot a thick felt sole with a hole cut out opposite the situation of the cicatrix. When a joint has been opened into, the difficulty of thoroughly getting rid of all unhealthy and infected granulations is so great that amputation may be advisable, but it is to be remembered that ulceration may recur in the stump if pressure is put upon it. The treatment of any nervous disease or glycosuria which may coexist is, of course, indicated.

Exposure of the plantar nerves by an incision behind the medial malleolus, and subjecting them to forcible stretching, has been employed by Chipault and others in the treatment of perforating ulcers of the foot.

The ulcer that forms in relation to callosities on the sole of the foot

is treated by paring away all the thickened skin, after softening it with soda fomentations, removing the unhealthy granulations, and applying stimulating dressings.

Treatment of Ulcers due to Constitutional Causes.--When ulcers are associated with such diseases as tuberculosis, syphilis, diabetes, Bright's disease, scurvy, or gout, these must receive appropriate treatment.

The local treatment of the tuberculous ulcer calls for special mention. If the ulcer is of limited extent and situated on an exposed part of the body, the most satisfactory method is complete removal, by means of the knife, scissors, or sharp spoon, of the ulcerated surface and of all the infected area around it, so as to leave a healthy surface from which granulations may spring up. Should the raw surface left be likely to result in an unsightly scar or in cicatricial contraction, skin-grafting should be employed.

For extensive ulcers on the limbs, the chest wall, or on other covered parts, or when operative treatment is contra-indicated, the use of tuberculin and exposure to the Rontgen rays have proved beneficial. The induction of passive hyperaemia, by Bier's or by Klapp's apparatus, should also be used, either alone or supplementary to other measures.

No ulcerative process responds so readily to medicinal treatment as the syphilitic ulcer does to the intra-venous administration of arsenical preparations of the "606" or "914" groups or to full doses of iodide of potassium and mercury, and the local application of black wash. When the ulceration has lasted for a long time, however, and is widespread and deep, the duration of treatment is materially shortened by a thorough scraping with the sharp spoon.

#Treatment in relation to the Condition of the Ulcer.--Ulcers in a weak condition.--If the weak condition of the ulcer is due to anaemia or kidney disease, these affections must first be treated. Locally, the imperfect granulations should be scraped away, and some stimulating agent applied to the raw surface to promote the growth of healthy granulations. For this purpose the sore may be covered with gauze smeared with a 6 to 8 per cent. ointment of scarlet-red, the surrounding parts being protected from the irritant action of the scarlet-red by a layer of vaseline. A dressing of gauze moistened with eusol or of boracic lint wrung out of red lotion (2 grains of sulphate of zinc, and 10 minims of compound tincture of lavender, to an ounce of water), and covered with a layer of gutta-percha tissue, is also useful.

When the condition has resulted from the prolonged use of moist dressings, these must be stopped, the redundant granulations clipped away with scissors, the surface rubbed with silver nitrate or sulphate of copper (blue-stone), and dry dressings applied.

When the ulcer has assumed the characters of a healing sore, skin-grafts may be applied to hasten cicatrisation.

Ulcers in a callous condition call for treatment in three directions--(1) The infective element must be eliminated. When the ulcer is foul, relays of charcoal poultices (three parts of linseed meal to one of charcoal), maintained for thirty-six to forty-eight hours, are useful as a preliminary step. The base of the ulcer and the thickened edges should then be freely scraped with a sharp spoon, and the resulting raw surface sponged over with undiluted carbolic acid or iodine, after which an antiseptic dressing is applied, and changed daily till healthy granulations appear. (2) The venous return must be facilitated by elevation of the limb and massage. (3) The induration of the surrounding parts must be got rid of before contraction of the sore is possible. For this purpose the free application of blisters, as first recommended by Syme, leaves little to be desired. Liquor epispasticus painted over the parts, or a large fly-blister (emplastrum cantharidis) applied all round the ulcer, speedily disperses the inflammatory products which cause the induration. The use of elastic pressure or of strapping, of hot-air baths, or the making of multiple incisions in the

skin around the ulcer, fulfils the same object.

As soon as the ulcer assumes the characters of a healing sore, it should be covered with skin-grafts, which furnish a much better cicatrix than that which forms when the ulcer is allowed to heal without such aid.

A more radical method of treatment consists in excising the whole ulcer, including its edges and about a quarter of an inch of the surrounding tissue, as well as the underlying fibrous tissue, and grafting the raw surface.

Ambulatory Treatment. --When the circumstances of the patient forbid his lying up in bed, the healing of the ulcer is much delayed. He should be instructed to take every possible opportunity of placing the limb in an elevated position, and must constantly wear a firm bandage of elastic webbing. This webbing is porous and admits of evaporation of the skin and wound secretions--an advantage it has over Martin's rubber bandage. The bandage should extend from the toes to well above the knee, and should always be applied while the patient is in the recumbent position with the leg elevated, preferably before getting out of bed in the morning. Additional support is given to the veins if the bandage is applied as a figure of eight.

We have found the following method satisfactory in out-patient practice. The patient lying on a couch, the limb is raised about eighteen inches and kept in this position for five minutes--till the excess of blood has left it. With the limb still raised, the ulcer with the surrounding skin is covered with a layer, about half an inch thick, of finely powdered boracic acid, and the leg, from foot to knee, excluding the sole, is enveloped in a thick layer of wood-wool wadding. This is held in position by ordinary cotton bandages, painted over with liquid starch; while the starch is drying the limb is kept elevated. With this appliance the patient may continue to work, and the dressing does not require to be changed oftener than once in three or four weeks (W. G. Richardson).

When an ulcer becomes acutely inflamed as a result of superadded infection, antiseptic measures are employed to overcome the infection, and ichthyl or other soothing applications may be used to allay the pain.

The phagedaenic ulcer calls for more energetic means of disinfection; the whole of the affected surface is touched with the actual cautery at a white heat, or is painted with pure carbolic acid. Relays of charcoal poultices are then applied until the spread of the disease is arrested.

For the irritable ulcer the most satisfactory treatment is complete excision and subsequent skin-grafting.

CHAPTER VI

GANGRENE

Definition--Types: Dry, Moist--Varieties--Gangrene primarily due to interference with circulation: Senile gangrene; Embolic gangrene; Gangrene following ligation of arteries; Gangrene from mechanical causes; Gangrene from heat, chemical agents, and cold; Diabetic gangrene; Gangrene associated with spasm of blood vessels; Raynaud's disease; Angio-sclerotic gangrene; Gangrene from ergot. Bacterial varieties of gangrene.
Pathology--clinical varieties--Acute infective gangrene; Malignant oedema; Acute emphysematous or gas gangrene; Cancrum oris, etc. Bed-sores: Acute; chronic.

Gangrene or mortification is the process by which a portion of tissue dies en masse, as distinguished from the molecular or cellular death

which constitutes ulceration. The dead portion is known as a _slough_.

In this chapter we shall confine our attention to the process as it affects the limbs and superficial parts, leaving gangrene of the viscera to be described in regional surgery.

TYPES OF GANGRENE

Two distinct types of gangrene are met with, which, from their most obvious point of difference, are known respectively as _dry_ and _moist_, and there are several clinical varieties of each type.

Speaking generally, it may be said that dry gangrene is essentially due to a simple _interference with the blood supply_ of a part; while the main factor in the production of moist gangrene is _bacterial infection_.

The cardinal signs of gangrene are: change in the colour of the part, coldness, loss of sensation and motor power, and, lastly, loss of pulsation in the arteries.

#Dry Gangrene# or #Mummification# is a comparatively slow form of local death due, as a rule, to a diminution in the arterial blood supply of the affected part, resulting from such causes as the gradual narrowing of the lumen of the arteries by disease of their coats, or the blocking of the main vessel by an embolus.

As the fluids in the tissues are lost by evaporation the part becomes dry and shrivelled, and as the skin is usually intact, infection does not take place, or if it does, the want of moisture renders the part an unsuitable soil, and the organisms do not readily find a footing. Any spread of the process that may take place is chiefly influenced by the anatomical distribution of the blocked arteries, and is arrested as soon as it reaches an area rich in anastomotic vessels. The dead portion is then cast off, the irritation resulting from the contact of the dead with the still living tissue inducing the formation of granulations on the proximal side of the junction, and these by slowly eating into the dead portion produce a furrow--the _line of demarcation_--which gradually deepens until complete separation is effected. As the muscles and bones have a richer blood supply than the integument, the death of skin and subcutaneous tissues extends higher than that of muscles and bone, with the result that the stump left after spontaneous separation is conical, the end of the bone projecting beyond the soft parts.

Clinical Features.--The part undergoing mortification becomes colder than normal, the temperature falling to that of the surrounding atmosphere. In many instances, but not in all, the onset of the process is accompanied by severe neuralgic pain in the part, probably due to anaemia of the nerves, to neuritis, or to the irritation of the exposed axis cylinders by the dead and dying tissues around them. This pain soon ceases and gives place to a complete loss of sensation. The dead part becomes dry, horny, shrivelled, and semi-transparent--at first of a dark brown, but finally of a black colour, from the dissemination of blood pigment throughout the tissues. There is no putrefaction, and therefore no putrid odour; and the condition being non-infective, there is not necessarily any constitutional disturbance. In itself, therefore, dry gangrene does not involve immediate risk to life; the danger lies in the fact that the breach of surface at the line of demarcation furnishes a possible means of entrance for bacteria, which may lead to infective complications.

#Moist Gangrene# is an acute process, the dead part retaining its fluids and so affording a favourable soil for the development of bacteria. The action of the organisms and their toxins on the adjacent tissues leads to a rapid and wide spread of the process. The skin becomes moist and macerated, and bullae, containing dark-coloured fluid or gases, form under the epidermis. The putrefactive gases evolved cause the skin to become emphysematos and crepitant and produce an offensive odour. The tissues assume a greenish-black colour from the formation in them of a

sulphide of iron resulting from decomposition of the blood pigment. Under certain conditions the dead part may undergo changes resembling more closely those of ordinary post-mortem decomposition. Owing to its nature the spread of the gangrene is seldom arrested by the natural protective processes, and it usually continues until the condition proves fatal from the absorption of toxins into the circulation.

The clinical features vary in the different varieties of moist gangrene, but the local results of bacterial action and the constitutional disturbance associated with toxin absorption are present in all; the prognosis therefore is grave in the extreme.

From what has been said, it will be gathered that in dry gangrene there is no urgent call for operation to save the patient's life, the primary indication being to prevent the access of bacteria to the dead part, and especially to the surface exposed at the line of demarcation. In moist gangrene, on the contrary, organisms having already obtained a footing, immediate removal of the dead and dying tissues, as a rule, offers the only hope of saving life.

VARIETIES OF GANGRENE

#Varieties of Gangrene essentially due to Interference with the Circulation#

While the varieties of gangrene included in this group depend primarily on interference with the circulation, it is to be borne in mind that the clinical course of the affection may be profoundly influenced by superadded infection with micro-organisms. Although the bacteria do not play the most important part in producing tissue necrosis, their

subsequent introduction is an accident of such importance that it may change the whole aspect of affairs and convert a dry form of gangrene into one of the moist type. Moreover, the low state of vitality of the tissues, and the extreme difficulty of securing and maintaining asepsis, make it a sequel of great frequency.

#Senile Gangrene.#--Senile gangrene is the commonest example of local death produced by a gradual diminution in the quantity of blood passing through the parts, as a result of arterio-sclerosis or other chronic disease of the arteries leading to diminution of their calibre. It is the most characteristic example of the dry type of gangrene. As the term indicates, it occurs in old persons, but the patient's age is to be reckoned by the condition of his arteries rather than by the number of his years. Thus the vessels of a comparatively young man who has suffered from syphilis and been addicted to alcohol are more liable to atheromatous degeneration leading to this form of gangrene than are those of a much older man who has lived a regular and abstemious life. This form of gangrene is much more common in men than in women. While it usually attacks only one foot, it is not uncommon for the other foot to be affected after an interval, and in some cases it is bilateral from the outset. It must clearly be understood that any form of gangrene may

occur in old persons, the term senile being here restricted to that variety which results from arterio-sclerosis.

[Illustration: FIG. 20.--Senile Gangrene of the Foot, showing line of demarcation.]

Clinical Features.--The commonest seat of the disease is in the toes, especially the great toe, whence it spreads up the foot to the heel, or even to the leg (Fig. 20). There is often a history of some slight injury preceding its onset. The vitality of the tissues is so low that the balance between life and death may be turned by the most trivial injury, such as a cut while paring a toe-nail or a corn, a blister caused by an ill-fitting shoe or the contact of a hot-bottle. In some cases the actual gangrene is determined by thrombosis of the popliteal or tibial arteries, which are already narrowed by obliterating endarteritis.

It is common to find that the patient has been troubled for a long time before the onset of definite signs of gangrene, with cold feet, with tingling and loss of feeling, or a peculiar sensation as if walking on cotton wool.

The first evidence of the death of the part varies in different cases. Sometimes a dark-blue spot appears on the medial side of the great toe and gradually increases in size; or a blister containing blood-stained fluid may form. Streaks or patches of dark-blue mottling appear higher up on the foot or leg. In other cases a small sore surrounded by a congested areola forms in relation to the nail and refuses to heal. Such sores on the toes of old persons are always to be looked upon with suspicion and treated with the greatest care; and the urine should be examined for sugar. There is often severe, deep-seated pain of a neuralgic character, with cramps in the limb, and these may persist long after a line of demarcation has formed. The dying part loses sensibility to touch and becomes cold and shrivelled.

All the physical appearances and clinical symptoms associated with dry gangrene supervene, and the dead portion is delimited by a line of demarcation. If this forms slowly and irregularly it indicates a very unsatisfactory condition of the circulation; while, if it forms quickly and decidedly, the presumption is that the circulation in the parts above is fairly good. The separation of the dead part is always attended with the risk of infection taking place, and should this occur, the temperature rises and other evidences of toxæmia appear.

Prophylaxis.--The toes and feet of old people, the condition of whose circulation predisposes them to gangrene, should be protected from slight injuries such as may be received while paring nails, cutting corns, or wearing ill-fitting boots. The patient should also be warned of the risk of exposure to cold, the use of hot-bottles, and of placing the feet near a fire. Attempts have been made to improve the peripheral circulation by establishing an anastomosis between the main artery of a limb and its companion vein, so that arterial blood may reach the peripheral capillaries--reversal of the circulation--but the clinical results have proved disappointing. (See Op. Surg., p. 29.)

Treatment.--When there is evidence that gangrene has occurred, the first indication is to prevent infection by purifying the part, and after careful drying to wrap it in a thick layer of absorbent and antiseptic wool, retained in place by a loosely applied bandage. A slight degree of elevation of the limb is an advantage, but it must not be sufficient to diminish the amount of blood entering the part. Hot-bottles are to be used with the utmost caution. As absolute dryness is essential, ointments or other greasy dressings are to be avoided, as they tend to prevent evaporation from the skin. Opium should be given freely to alleviate pain. Stimulation is to be avoided, and the patient should be carefully dieted.

When the gangrene is limited to the toes in old and feeble patients, some surgeons advocate the expectant method of treatment, waiting for a line of demarcation to form and allowing the dead part to be separated. This takes place so slowly, however, that it necessitates the patient being laid up for many weeks, or even months; and we agree with the majority in advising early amputation.

In this connection it is worthy of note that there are certain points at which gangrene naturally tends to become arrested--namely, at the highly vascular areas in the neighbourhood of joints. Thus gangrene of the great toe often stops when it reaches the metatarso-phalangeal joint; or if it trespasses this limit it may be arrested either at the tarso-metatarsal or at the ankle joint. If these be passed, it usually spreads up the leg to just below the knee before signs of arrestment appear. Further, it is seen from pathological specimens that the spread is greater on the dorsal than on the plantar aspect, and that the death of skin and subcutaneous tissues extends higher than that of bone and muscle.

These facts furnish us with indications as to the seat and method of amputation. Experience has proved that in senile gangrene of the lower extremity the most reliable and satisfactory results are obtained by amputating in the region of the knee, care being taken to perform the operation so as to leave the prepatellar anastomosis intact by retaining the patella in the anterior flap. The most satisfactory operation in these cases is Gritti's supra-condylar amputation. Haemorrhage is easily controlled by digital pressure, and the use of a tourniquet should be dispensed with, as the constriction of the limb is liable to interfere with the vitality of the flaps.

When the tibial vessels can be felt pulsating at the ankle it may be justifiable, if the patient urgently desires it, to amputate lower than the knee; but there is considerable risk of gangrene recurring in the stump and necessitating a second operation.

That amputation for senile gangrene performed between the ankle and the knee seldom succeeds, is explained by the fact that the vascular obstruction is usually in the upper part of the posterior tibial artery, and the operation is therefore performed through tissues with an inadequate blood supply. It is not uncommon, indeed, on amputating above the knee, to find even the popliteal artery plugged by a clot. This should be removed at the amputation by squeezing the vessel from above downward by a "milking" movement, or by "catheterising the artery" with the aid of a cannula with a terminal aperture.

It is to be borne in mind that the object of amputation in these cases is merely to remove the gangrenous part, and so relieve the patient of the discomfort and the risks from infection which its presence involves. While it is true that in many of these patients the operation is borne remarkably well, it must be borne in mind that those who suffer from senile gangrene are of necessity bad lives, and a guarded opinion should be expressed as to the prospects of survival. The possibility of the disease developing in the other limb has already been referred to.

[Illustration: FIG. 21---Embolic Gangrene of Hand and Arm.]

#Embolic Gangrene# (Fig. 21)...This is the most typical form of gangrene resulting from the sudden occlusion of the main artery of a part, whether by the impaction of an embolus or the formation of a thrombus in its lumen, when the collateral circulation is not sufficiently free to maintain the vitality of the tissues.

There is sudden pain at the site of impaction of the embolus, and the pulses beyond are lost. The limb becomes cold, numb, insensitive, and powerless. It is often pale at first--hence the term "white gangrene" sometimes applicable to the early appearances, which closely resemble those presented by the limb of a corpse.

If the part is aseptic it shrivels, and presents the ordinary features of dry gangrene. It is liable, however, especially in the lower extremity and when the veins also are obstructed, to become infected and to assume the characters of the moist type.

The extent of the gangrene depends upon the site of impaction of the embolus, thus if the abdominal aorta becomes suddenly occluded by an embolus at its bifurcation, the obstruction of the iliacs and femorals induces symmetrical gangrene of both extremities as high as the inguinal ligaments. When gangrene follows occlusion of the external iliac or of the femoral artery above the origin of its deep branch, the death of the limb extends as high as the middle or upper third of the thigh. When the femoral below the origin of its deep branch or the popliteal artery is obstructed, the veins remaining pervious, the anastomosis through the profunda is sufficient to maintain the vascular supply, and gangrene does not necessarily follow. The rupture of a popliteal aneurysm, however, by compressing the vein and the articular branches, usually determines gangrene. When an embolus becomes impacted at the bifurcation of the popliteal, if gangrene ensues it usually spreads well up the leg.

When the axillary artery is the seat of embolic impaction, and gangrene ensues, the process usually reaches the middle of the upper arm. Gangrene following the blocking of the brachial at its bifurcation usually extends as far as the junction of the lower and middle thirds of the forearm.

Gangrene due to thrombosis or embolism is sometimes met with in patients recovering from typhus, typhoid, or other fevers, such as that associated with child-bed. It occurs in peripheral parts, such as the toes, fingers, nose, or ears.

Treatment.--The general treatment of embolic gangrene is the same as that for the senile form. Success has followed opening the artery and removing the embolus. The artery is exposed at the seat of impaction and, having been clamped above and below, a longitudinal opening is made and the clot carefully extracted with the aid of forceps; it is sometimes unexpectedly long (one recorded from the femoral artery measured nearly 34 inches); the wound in the artery is then sewn up with fine silk soaked in paraffin. When amputation is indicated, it must be performed sufficiently high to ensure a free vascular supply to the flaps.

#Gangrene following Ligation of Arteries.#--After the ligation of an artery in its continuity--for example, in the treatment of aneurysm--the limb may for some days remain in a condition verging on gangrene, the distal parts being cold, devoid of sensation, and powerless. As the collateral circulation is established, the vitality of the tissues is gradually restored and these symptoms pass off. In some cases, however,--and especially in the lower extremity--gangrene ensues and presents the same characters as those resulting from embolism. It tends to be of the dry type. The occlusion of the vein as well as the artery is not found to increase the risk of gangrene.

#Gangrene from Mechanical Constriction of the Vessels of the part.#--The application of a bandage or plaster-of-Paris case too tightly, or of a tourniquet for too long a time, has been known to lead to death of the part beyond; but such cases are rare, as are also those due to the pressure of a fractured bone or of a tumour on a large artery or vein. When gangrene occurs from such causes, it tends to be of the moist type.

Much commoner is it to meet with localised areas of necrosis due to the excessive pressure of splints over bony prominences, such as the lateral malleolus, the medial condyle of the humerus, or femur, or over the dorsum of the foot. This is especially liable to occur when the nutrition of the skin is depressed by any interference with its nerve-supply, such as follows injuries to the spine or peripheral nerves, disease of the brain, or acute anterior poliomyelitis. When the splint is removed the skin pressed upon is found to be of a pale yellow or grey colour, and is surrounded by a ring of hyperaemia. If protected from infection, the clinical course is that of dry gangrene.

Bed-sores, which are closely allied to pressure sores, will be described at the end of this chapter.

When a localised portion of tissue, for example, a piece of skin, is so severely crushed or bruised that its blood vessels are occluded and its structure destroyed, it dies, and, if not infected with bacteria, dries up, and the shrivelled brown skin is slowly separated by the growth of granulation tissue beneath and around it.

Fingers, toes, or even considerable portions of limbs may in the same way be suddenly destroyed by severe trauma, and undergo mummification. If organisms gain access, typical moist gangrene may ensue, or changes similar to those of ordinary post-mortem decomposition may take place.

Treatment.--The first indication is to exclude bacteria by purifying the damaged part and its surroundings, and applying dry, non-irritating dressings.

When these measures are successful, dry gangrene ensues. The raw surface

left after the separation of the dead skin may be allowed to heal by granulation, or may be covered by skin-grafts. In the case of a finger or a limb it is not necessary to wait until spontaneous separation takes place, as this is often a slow process. When a well-marked line of demarcation has formed, amputation may be performed just sufficiently far above it to enable suitable flaps to be made.

The end of a stump, after spontaneous separation of the gangrenous portion, requires to be trimmed, sufficient bone being removed to permit of the soft parts coming together.

If moist gangrene supervenes, amputation must be performed without delay, and at a higher level.

#Gangrene from Heat, Chemical Agents, and Cold.--Severe #burns# and #scalds# may be followed by necrosis of tissue. So long as the parts are kept absolutely dry--as, for example, by the picric acid method of treatment--the grossly damaged portions of tissue undergo dry gangrene; but when wet or oily dressings are applied and organisms gain access, moist gangrene follows.

Strong #chemical agents#, such as caustic potash, nitric or sulphuric acid, may also induce local tissue necrosis, the general appearances of the lesions produced being like those of severe burns. The resulting sloughs are slow to separate, and leave deep punched-out cavities which are long of healing.

#Carbolic Gangrene.--Carbolic acid, even in comparatively weak solution, is liable to induce dry gangrene when applied as a fomentation to a finger, especially in women and children. Thrombosis occurs in the blood vessels of the part, which at first is pale and soft, but later becomes dark and leathery. On account of the anaesthetic action of carbolic acid, the onset of the process is painless, and the patient does not realise his danger. A line of demarcation soon forms, but the dead part separates very slowly.

#Gangrene from Frost-bite.--It is difficult to draw the line between the third degree of chilblain and the milder forms of true frost-bite; the difference is merely one of degree. Frost-bite affects chiefly the toes and fingers--especially the great toe and the little finger--the ears, and the nose. In this country it is seldom seen except in members of the tramp class, who, in addition to being exposed to cold by sleeping in the open air, are ill-fed and generally debilitated. The condition usually manifests itself after the parts, having been subjected to extreme cold, are brought into warm surroundings. The first symptom is numbness in the part, followed by a sense of weight, tingling, and finally by complete loss of sensation. The part attacked becomes white and bleached-looking, feels icy cold, and is insensitive to touch. Either immediately, or, it may be, not for several days, it becomes discoloured and swollen, and finally contracts and shrivels. Above the dead area the limb may be the seat of excruciating pain. The dead portion is cast off, as in other forms of dry gangrene, by the formation of a line of demarcation.

To prevent the occurrence of gangrene from frost-bite it is necessary to avoid the sudden application of heat. The patient should be placed in a cold room, and the part rubbed with snow, or put in a cold bath, and have light friction applied to it. As the circulation is restored the general surroundings and the local applications are gradually made warmer. Elevation of the part, wrapping it in cotton wool, and removal to a warmer room, are then permissible, and stimulants and warm drinks may be given with caution. When by these means the occurrence of gangrene is averted, recovery ensues, its onset being indicated by the white parts assuming a livid red hue and becoming the seat of an acute burning sensation.

A condition known as Trench feet was widely prevalent amongst the troops in France during the European War. Although allied to frost-bite, cold appears to play a less important part in its causation than humidity and constriction of the limbs producing ischaemia of the feet.

Changes were found in the endothelium of the blood vessels, the axis cylinders of nerves, and the muscles. The condition does not occur in civil life.

#Diabetic Gangrene.#--This form of gangrene is prone to occur in persons over fifty years of age who suffer from glycosuria. The arteries are often markedly diseased. In some cases the existence of the glycosuria is unsuspected before the onset of the gangrene, and it is only on examining the urine that the cause of the condition is discovered. The gangrenous process seldom begins as suddenly as that associated with embolism, and, like senile gangrene, which it may closely simulate in its early stages, it not infrequently begins after a slight injury to one of the toes. It but rarely, however, assumes the dry, shrivelling type, as a rule being attended with swelling, oedema, and dusky redness of the foot, and severe pain. According to Paget, the dead part remains warm longer than in other forms of senile gangrene; there is a greater tendency for patches of skin at some distance from the primary seat of disease to become gangrenous, and for the death of tissue to extend upwards in the subcutaneous planes, leaving the overlying skin unaffected. The low vitality of the tissues favours the growth of bacteria, and if these gain access, the gangrene assumes the characters of the moist type and spreads rapidly.

The rules for amputation are the same as those governing the treatment of senile gangrene, the level at which the limb is removed depending upon whether the gangrene is of the dry or moist type. The general treatment for diabetes must, of course, be employed whether amputation is performed or not. Paget recommended that the dietetic treatment should not be so rigid as in uncomplicated diabetes, and that opium should be given freely.

The prognosis even after amputation is unfavourable. In many cases the patient dies with symptoms of diabetic coma within a few days of the operation; or, if he survives this, he may eventually succumb to diabetes. In others there is sloughing of the flaps and death results from toxæmia. Occasionally the other limb becomes gangrenous. On the other hand, the glycosuria may diminish or may even disappear after amputation.

#Gangrene associated with Spasm of Blood Vessels.#--#Raynaud's Disease#, or symmetrical gangrene, is supposed to be due to spasm of the arterioles, resulting from peripheral neuritis. It occurs oftenest in women, between the ages of eighteen and thirty, who are the subjects of uterine disorders, anaemia, or chlorosis. Cold is an aggravating factor, as the disease is commonest during the winter months. The digits of both hands or the toes of both feet are simultaneously attacked, and the disease seldom spreads beyond the phalanges or deeper than the skin.

The first evidence is that the fingers become cold, white, and insensitive to touch and pain. These attacks of local syncope recur at varying intervals for months or even years. They last for a few minutes or even for some hours, and as they pass off the parts become hyperaemic and painful.

A more advanced stage of the disease is known as local asphyxia. The circulation through the fingers becomes exceedingly sluggish, and the parts assume a dull, livid hue. There is swelling and burning or shooting pain. This may pass off in a few days, or may increase in severity, with the formation of bullæ, and end in dry gangrene. As a rule, the slough which forms is comparatively small and superficial, but it may take some months to separate. The condition tends to recur in successive winters.

The treatment consists in remedying any nervous or uterine disorder that may be present, keeping the parts warm by wrapping them in cotton wool, and in the use of hot-air or electric baths, the parts being immersed in water through which a constant current is passed. When gangrene occurs, it is treated on the same lines as other forms of dry gangrene, but if amputation is called for it is only with a view to removing the dead part.

#Angio-sclerotic Gangrene.--A form of gangrene due to angio-sclerosis is occasionally met with in young persons, even in children. It bears certain analogies to Raynaud's disease in that spasm of the vessels plays a part in determining the local death.

The main arteries are narrowed by hyperplastic endarteritis followed by thrombosis, and similar changes are found in the veins. The condition is usually met with in the feet, but the upper extremity may be affected, and is attended with very severe pain, rendering sleep impossible.

The patient is liable to sudden attacks of numbness, tingling and weakness of the limbs which pass off with rest--intermittent claudication. During these attacks the large arteries--femoral, brachial, and subclavian--can be felt as firm cords, while pulsation is lost in the peripheral vessels. Gangrene eventually ensues, is attended with great pain and runs a slow course. It is treated on the same lines as Raynaud's disease.

#Gangrene from Ergot.--Gangrene may occur from interference with blood supply, the result of tetanic contraction of the minute vessels, such as results in ill-nourished persons who eat large quantities of coarse rye bread contaminated with the claviceps purpurea and containing the ergot of rye. It has also occurred in the fingers of patients who have taken ergot medicinally over long periods. The gangrene, which attacks the toes, fingers, ears, or nose, is preceded by formication, numbness, and pains in the parts to be affected, and is of the dry variety.

In this country it is usually met with in sailors off foreign ships, whose dietary largely consists of rye bread. Trivial injuries may be the starting-point, the anaesthesia produced by the ergotin preventing the patient taking notice of them. Alcoholism is a potent predisposing cause.

As it is impossible to predict how far the process will spread, it is advisable to wait for the formation of a line of demarcation before operating, and then to amputate immediately above the dead part.

BACTERIAL VARIETIES OF GANGRENE

The acute bacillary forms of gangrene all assume the moist type from the first, and, spreading rapidly, result in extensive necrosis of tissue, and often end fatally.

The infection is usually a mixed one in which anaerobic bacteria predominate. The anaerobe most constantly present is the bacillus aerogenes capsulatus, usually in association with other anaerobes, and sometimes with pyogenic diplo- and streptococci. According to the mode of action of the associated organisms and the combined effects of their toxins on the tissues, the gangrenous process presents different pathological and clinical features. Some combinations, for example, result in a rapidly spreading cellulitis with early necrosis of connective tissue accompanied by thrombosis throughout the capillary and venous circulation of the parts implicated; other combinations cause great oedema of the part, and others again lead to the formation of gases in the tissues, particularly in the muscles.

These different effects do not appear to be due to a specific action of any one of the organisms present, but to the combined effect of a particular group living in symbiosis.

According as the cellulitic, the oedematous, or the gaseous characteristics predominate, the clinical varieties of bacillary gangrene may be separately described, but it must be clearly understood that they frequently overlap and cannot always be distinguished from one another.

#Clinical Varieties of Bacillary Gangrene.--#Acute infective gangrene# is the form most commonly met with in civil practice. It may follow such

trivial injuries as a pin-prick or a scratch, the signs of acute cellulitis rapidly giving place to those of a spreading gangrene. Or it may ensue on a severe railway, machinery, or street accident, when lacerated and bruised tissues are contaminated with gross dirt. Often within a few hours of the injury the whole part rapidly becomes painful, swollen, oedematous, and tense. The skin is at first glazed, and perhaps paler than normal, but soon assumes a dull red or purplish hue, and bullae form on the surface. Putrefactive gases may be evolved in the tissues, and their presence is indicated by emphysematous crackling when the part is handled. The spread of the disease is so rapid that its progress is quite visible from hour to hour, and may be traced by the occurrence of red lines along the course of the lymphatics of the limb. In the most acute cases the death of the affected part takes place so rapidly that the local changes indicative of gangrene have not time to occur, and the fact that the part is dead may be overlooked.

[Illustration: FIG. 22.--Gangrene of Terminal Phalanx of Index-Finger, following cellulitis of hand resulting from a scratch on the palm of the hand.]

Rigors may occur, but the temperature is not necessarily raised--indeed, it is sometimes subnormal. The pulse is small, feeble, rapid, and irregular. Unless amputation is promptly performed, death usually follows within thirty-six or forty-eight hours. Even early operation does not always avert the fatal issue, because the quantity of toxin absorbed and its extreme virulence are often more than even a robust subject can outlive.

Treatment.--Every effort must be made to purify all such wounds as are contaminated by earth, street dust, stable refuse, or other forms of gross dirt. Devitalised and contaminated tissue is removed with the knife or scissors and the wound purified with antiseptics of the chlorine group or with hydrogen peroxide. If there is a reasonable prospect that infection has been overcome, the wound may be at once sutured, but if this is doubtful it is left open and packed or irrigated.

When acute gangrene has set in no treatment short of amputation is of any avail, and the sooner this is done, the greater is the hope of saving the patient. The limb must be amputated well beyond the apparent limits of the infected area, and stringent precautions must be taken to avoid discharge from the already gangrenous area reaching the operation wound. An assistant or nurse, who is to take no other part in the operation, is told off to carry out the preliminary purification, and to hold the limb during the operation.

#Malignant Oedema.#--This form of acute gangrene has been defined as "a spreading inflammatory oedema attended with emphysema, and ultimately followed by gangrene of the skin and adjacent parts." The predominant organism is the bacillus of malignant oedema or vibron septique of Pasteur, which is found in garden soil, dung, and various putrefying substances. It is anaerobic, and occurs as long, thick rods with somewhat rounded ends and several laterally placed flagella. Spores, which have a high power of resistance, form in the centre of the rods, and bulge out the sides so as to give the organisms a spindle-shaped outline. Other pathogenic organisms are also present and aid the specific bacillus in its action.

At the bedside it is difficult, if not impossible, to distinguish it from acute infective gangrene. Both follow on the same kinds of injury and run an exceedingly rapid course. In malignant oedema, however, the incidence of the disease is mainly on the superficial parts, which become oedematous and emphysematous, and acquire a marbled appearance with the veins clearly outlined. Early disappearance of sensation is a particularly grave symptom. Bullae form on the skin, and the tissues have "a peculiar heavy but not putrid odour." The constitutional effects are extremely severe, and death may ensue within a few hours.

#Acute Emphysematous# or #Gas Gangrene# was prevalent in certain areas at various periods during the European War. It follows infection of

lacerated wounds with the *bacillus aerogenes capsulatus*, usually in combination with other anaerobes, and its main incidence is on the muscles, which rapidly become infiltrated with gas that spreads throughout the whole extent of the muscle, disintegrating its fibres and leading to necrosis. The gangrenous process spreads with appalling rapidity, the limb becoming enormously swollen, painful, and crepitant or even tympanitic. Patches of coppery or purple colour appear on the skin, and bullae containing blood-stained serum form on the surface. The toxæmia is profound, and the face and lips assume a characteristic cyanosis. The condition is attended with a high mortality. Only in the early stages and when the infection is limited are local measures successful in arresting the spread; in more severe cases amputation is the only means of saving life.

#Cancrum Oris# or #Noma#---This disease is believed to be due to a specific bacillus, which occurs in long delicate rods, and is chiefly found at the margin of the gangrenous area. It is prone to attack unhealthy children from two to five years of age, especially during their convalescence from such diseases as measles, scarlet fever, or typhoid, but may attack adults when they are debilitated. It is most common in the mouth, but sometimes occurs on the vulva. In the mouth it begins as an ulcerative stomatitis, more especially affecting the gums or inner aspect of the cheek. The child lies prostrated, and from the open mouth foul-smelling saliva, streaked with blood, escapes; the face is of an ashy-grey colour, the lips dark and swollen. On the inner aspect of the cheek is a deeply ulcerated surface, with sloughy shreds of dark-brown or black tissue covering its base; the edges are irregular, firm, and swollen, and the surrounding mucous membrane is infiltrated and oedematous. In the course of a few hours a dark spot appears on the outer aspect of the cheek, and rapidly increases in size; towards the centre it is black, shading off through blue and grey into a dark-red area which extends over the cheek (Fig. 23). The tissue implicated is at first firm and indurated, but as it loses its vitality it becomes doughy and sodden. Finally a slough forms, and, when it separates, the cheek is perforated.

Meanwhile the process spreads inside the mouth, and the gums, the floor of the mouth, or even the jaws, may become gangrenous and the teeth fall out. The constitutional disturbance is severe, the temperature raised, and the pulse feeble and rapid.

The extremely foetid odour which pervades the room or even the house the patient occupies, is usually sufficient to suggest the diagnosis of cancrum oris. The odour must not be mistaken for that due to decomposition of sordes on the teeth and gums of a debilitated patient.

The *prognosis* is always grave in the extreme, the main risks being general toxæmia and septic pneumonia. When recovery takes place there is serious deformity, and considerable portions of the jaws may be lost by necrosis.

[Illustration: FIG. 23---Cancrum oris.

(From a photograph lent by Sir George T. Beatson.)]

Treatment.--The only satisfactory treatment is thorough removal under an anaesthetic of all the sloughy tissue, with the surrounding zone in which the organisms are active. This is most efficiently accomplished by the knife or scissors, cutting until the tissue bleeds freely, after which the raw surface is painted with undiluted carbolic acid and dressed with iodoform gauze. It may be necessary to remove large pieces of bone when the necrotic process has implicated the jaws. The mouth must be constantly sprayed with peroxide of hydrogen, and washed out with a disinfectant and deodorant lotion, such as Condy's fluid. The patient's general condition calls for free stimulation.

The deformity resulting from these necessarily heroic measures is not so great as might be expected, and can be further diminished by plastic operations, which should be undertaken before cicatricial contraction has occurred.

BED-SORES

Bed-sores are most frequently met with in old and debilitated patients, or in those whose tissues are devitalised by acute or chronic diseases associated with stagnation of blood in the peripheral veins. Any interference with the nerve-supply of the skin, whether from injury or disease of the central nervous system or of the peripheral nerves, strongly predisposes to the formation of bed-sores. Prolonged and excessive pressure over a bony prominence, especially if the parts be moist with skin secretions, urine, or wound discharges, determines the formation of a sore. Excoriations, which may develop into true bed-sores, sometimes form where two skin surfaces remain constantly apposed, as in the region of the scrotum or labium, under pendulous mammae, or between fingers or toes confined in a splint.

[Illustration: FIG. 24---Acute Bed-Sores over Right Buttock.]

Clinical Features.--Two clinical varieties are met with--the acute and the chronic bed-sore.

The acute bed-sore usually occurs over the sacrum or buttock. It develops rapidly after spinal injuries and in the course of certain brain diseases. The part affected becomes red and congested, while the surrounding parts are oedematous and swollen, blisters form, and the skin loses its vitality (Fig. 24).

In advanced cases of general paralysis of the insane, a peculiar form of acute bed-sore beginning as a blister, and passing on to the formation of a black, dry eschar, which slowly separates, occurs on such parts as the medial side of the knee, the angle of the scapula, and the heel.

The chronic bed-sore begins as a dusky reddish purple patch, which gradually becomes darker till it is almost black. The parts around are oedematous, and a blister may form. This bursts and exposes the papillae of the skin, which are of a greenish hue. A tough greyish-black slough forms, and is slowly separated. It is not uncommon for the gangrenous area to continue to spread both in width and in depth till it reaches the periosteum or bone. Bed-sores over the sacrum sometimes implicate the vertebral canal and lead to spinal meningitis, which usually proves fatal.

In old and debilitated patients the septic absorption taking place from a bed-sore often proves a serious complication of other surgical conditions. From this cause, for example, old people may succumb during the treatment of a fractured thigh.

The granulating surface left on the separation of the slough tends to heal comparatively rapidly.

Prevention of Bed-sores.--The first essential in the prevention of bed-sores is the regular changing of the patient's position, so that no one part of the body is continuously pressed upon for any length of time. Ring-pads of wool, air-cushions, or water-beds are necessary to remove pressure from prominent parts. Absolute dryness of the skin is all-important. At least once a day, the sacrum, buttocks, shoulder-blades, heels, elbows, malleoli, or other parts exposed to pressure, must be sponged with soap and water, thoroughly dried, and then rubbed with methylated spirit, which is allowed to dry on the skin. Dusting the part with boracic acid powder not only keeps it dry, but prevents the development of bacteria in the skin secretions.

In operation cases, care must be taken that irritating chemicals used to purify the skin do not collect under the patient and remain in contact with the skin of the sacrum and buttocks during the time he is on the operating-table. There is reason to believe that the so-called "post-operation bed-sore" may be due to such causes. A similar result has been known to follow soiling of the sheets by the escape of a turpentine enema.

Treatment.--Once a bed-sore has formed, every effort must be made to prevent its spread. Alcohol is used to cleanse the broken surface, and dry absorbent dressings are applied and frequently changed. It is sometimes found necessary to employ moist or oily substances, such as boracic poultices, eucalyptus ointment, or balsam of Peru, to facilitate the separation of sloughs, or to promote the growth of granulations. In patients who are not extremely debilitated the slough may be excised, the raw surface scraped, and then painted with iodine.

Skin-grafting is sometimes useful in covering in the large raw surface left after separation or removal of sloughs.

CHAPTER VII

BACTERIAL AND OTHER WOUND INFECTIONS

Erysipelas--Diphtheria--Tetanus--Hydrophobia--Anthrax--
Glanders--Actinomycosis--Mycetoma--Delhi
boil--Chigoe--Poisoning by insects--Snake-bites.

ERYSIPELAS

Erysipelas, popularly known as "rose," is an acute spreading infective disease of the skin or of a mucous membrane due to the action of a streptococcus. Infection invariably takes place through an abrasion of the surface, although this may be so slight that it escapes observation even when sought for. The streptococci are found most abundantly in the lymph spaces just beyond the swollen margin of the inflammatory area, and in the serous blebs which sometimes form on the surface.

#Clinical Features.--Facial erysipelas is the commonest clinical variety, infection usually occurring through some slight abrasion in the region of the mouth or nose, or from an operation wound in this area. From this point of origin the inflammation may spread all over the face and scalp as far back as the nape of the neck. It stops, however, at the chin, and never extends on to the front of the neck. There is great oedema of the face, the eyes becoming closed up, and the features unrecognisable. The inflammation may spread to the meninges, the intracranial venous sinuses, the eye, or the ear. In some cases the erysipelas invades the mucous membrane of the mouth, and spreads to the fauces and larynx, setting up an oedema of the glottis which may prove dangerous to life.

Erysipelas occasionally attacks an operation wound that has become septic; and it may accompany septic infection of the genital tract in puerperal women, or the separation of the umbilical cord in infants (erysipelas neonatorum). After an incubation period, which varies from fifteen to sixty hours, the patient complains of headache, pains in the back and limbs, loss of appetite, nausea, and frequently there is vomiting. He has a chill or slight rigor, initiating a rise of temperature to 103°, 104°, or 105° F.; and a full bounding pulse of about 100 (Fig. 25). The tongue is foul, the breath heavy, and, as a rule, the bowels are constipated. There is frequently albuminuria, and occasionally nocturnal delirium. A moderate degree of leucocytosis (15,000 to 20,000) is usually present.

Around the seat of inoculation a diffuse red patch forms, varying in hue from a bright scarlet to a dull brick-red. The edges are slightly raised above the level of the surrounding skin, as may readily be recognised by gently stroking the part from the healthy towards the affected area. The skin is smooth, tense, and glossy, and presents here and there blisters filled with serous fluid. The local temperature is raised, and the part is the seat of a burning sensation and is tender to the touch, the most tender area being the actively spreading zone which lies about half an

inch beyond the red margin.

[Illustration: FIG. 25.--Chart of Erysipelas occurring in a wound.]

The disease tends to spread spasmodically and irregularly, and the direction and extent of its progress may be recognised by mapping out the peripheral zone of tenderness. Red streaks appear along the lines of the superficial lymph vessels, and the deep lymphatics may sometimes be palpated as firm, tender cords. The neighbouring glands, also, are generally enlarged and tender.

The disease lasts for from two or three days to as many weeks, and relapses are frequent. Spontaneous resolution usually takes place, but the disease may prove fatal from absorption of toxins, involvement of the brain or meninges, or from general streptococcal infection.

#Complications.#--_Diffuse suppurative cellulitis_ is the most serious local complication, and results from a mixed infection with other pyogenic bacteria. Small _localised superficial abscesses_ may form during the convalescent stage. They are doubtless due to the action of skin bacteria, which attack the tissues devitalised by the erysipelas. A persistent form of _oedema_ sometimes remains after recurrent attacks of erysipelas, especially when they affect the face or the lower extremity, a condition which is referred to with elephantiasis.

#Treatment.#--The first indication is to endeavour to arrest the spread of the process. We have found that by painting with linimentum iodi, a ring half an inch broad, about an inch in front of the peripheral tender zone--not the red margin--an artificial leucocytosis is produced, and the advancing streptococci are thereby arrested. Several coats of the iodine are applied, one after the other, and this is repeated daily for several days, even although the erysipelas has not overstepped the ring. Success depends upon using the liniment of iodine (the tincture is not strong enough), and in applying it well in front of the disease. To allay pain the most useful local applications are ichthyl ointment (1 in 6), or lead and opium fomentations.

The general treatment consists in attending to the emunctories, in administrating quinine in small--two-grain--doses every four hours, or salicylate of iron (2-5 gr. every three hours), and in giving plenty of fluid nourishment. It is worthy of note that the anti-streptococcic serum has proved of less value in the treatment of erysipelas than might have been expected, probably because the serum is not made from the proper strain of streptococcus.

It is not necessary to isolate cases of erysipelas, provided the usual precautions against carrying infection from one patient to another are rigidly carried out.

DIPHTHERIA

Diphtheria is an acute infective disease due to the action of a specific bacterium, the bacillus diphtheriae or Klebs-Loffler bacillus. The disease is usually transmitted from one patient to another, but it may be contracted from cats, fowls, or through the milk of infected cows. Cases have occurred in which the surgeon has carried the infection from one patient to another through neglect of antiseptic precautions. The incubation period varies from two to seven days.

#Clinical Features.#--In pharyngeal diphtheria, on the first or second day of the disease, redness and swelling of the mucous membrane of the pharynx, tonsils, and palate are well marked, and small, circular greenish or grey patches of false membrane, composed of necrosed epithelium, fibrin, leucocytes, and red blood corpuscles, begin to appear. These rapidly increase in area and thickness, till they coalesce and form a complete covering to the parts. In the pharynx the false membrane is less adherent to the surface than it is when the disease affects the air-passages. The diphtheritic process may spread from the pharynx to the nasal cavities, causing blocking of the nares, with a

profuse ichorous discharge from the nostrils, and sometimes severe epistaxis. The infection may spread along the nasal duct to the conjunctiva. The middle ear also may become involved by spread along the auditory (Eustachian) tube.

The lymph glands behind the angle of the jaw enlarge and become tender, and may suppurate from superadded infection. There is pain on swallowing, and often earache; and the patient speaks with a nasal accent. He becomes weak and anaemic, and loses his appetite. There is often albuminuria. Leucocytosis is usually well marked before the injection of antitoxin; after the injection there is usually a diminution in the number of leucocytes. The false membrane may separate and be cast off, after which the patient gradually recovers. Death may take place from gradual failure of the heart's action or from syncope during some slight exertion.

Laryngeal Diphtheria.--The disease may arise in the larynx, although, as a rule, it spreads thence from the pharynx. It first manifests itself by a short, dry, croupy cough, and hoarseness of the voice. The first difficulty in breathing usually takes place during the night, and once it begins, it rapidly gets worse. Inspiration becomes noisy, sometimes stridulous or metallic or sibilant, and there is marked indrawing of the epigastrium and lower intercostal spaces. The hoarseness becomes more marked, the cough more severe, and the patient restless. The difficulty of breathing occurs in paroxysms, which gradually increase in frequency and severity, until at length the patient becomes asphyxiated. The duration of the disease varies from a few hours to four or five days.

After the acute symptoms have passed off, various localised paralyses may develop, affecting particularly the nerves of the palatal and orbital muscles, less frequently the lower limbs.

#Diagnosis.--The finding of the Klebs-Loffler bacillus is the only conclusive evidence of the disease. The bacillus may be obtained by swabbing the throat with a piece of aseptic--not antiseptic--cotton wool or clean linen rag held in a pair of forceps, and rotated so as to entangle portions of the false membrane or exudate. The swab thus obtained is placed in a test-tube, previously sterilised by having had some water boiled in it, and sent to a laboratory for investigation. To identify the bacillus a piece of the membrane from the swab is rubbed on a cover glass, dried, and stained with methylene blue or other basic stain; or cultures may be made on agar or other suitable medium. When a bacteriological examination is impossible, or when the clinical features do not coincide with the results obtained, the patient should always be treated on the assumption that he suffers from diphtheria. So much doubt exists as to the real nature of membranous croup and its relationship to true diphtheria, that when the diagnosis between the two is uncertain the safest plan is to treat the case as one of diphtheria.

In children, diphtheria may occur on the vulva, vagina, prepuce, or glans penis, and give rise to difficulty in diagnosis, which is only cleared up by demonstration of the bacillus.

#Treatment.--An attempt may be made to destroy or to counteract the organisms by swabbing the throat with strong antiseptic solutions, such as 1 in 1000 corrosive sublimate or 1 in 30 carbolic acid, or by spraying with peroxide of hydrogen.

The antitoxic serum is our sheet-anchor in the treatment of diphtheria, and recourse should be had to its use as early as possible.

Difficulty of swallowing may be met by the use of a stomach tube passed either through the mouth or nose. When this is impracticable, nutrient enemata are called for.

In laryngeal diphtheria, the interference with respiration may call for intubation of the larynx, or tracheotomy, but the antitoxin treatment has greatly diminished the number of cases in which it becomes necessary to have recourse to these measures.

Intubation consists in introducing through the mouth into the larynx a tube which allows the patient to breathe freely during the period while the membrane is becoming separated and thrown off. This is best done with the apparatus of O'Dwyer; but when this instrument is not available, a simple gum-elastic catheter with a terminal opening (as suggested by MacEwen and Annandale) may be employed.

When intubation is impracticable, the operation of tracheotomy is called for if the patient's life is endangered by embarrassment of respiration. Unless the patient is in hospital with skilled assistance available, tracheotomy is the safer of the two procedures.

TETANUS

Tetanus is a disease resulting from infection of a wound by a specific micro-organism, the *bacillus tetani*, and characterised by increased reflex excitability, hypertonus, and spasm of one or more groups of voluntary muscles.

Etiology and Morbid Anatomy.--The tetanus bacillus, which is a perfect anaerobe, is widely distributed in nature and can be isolated from garden earth, dung-heaps, and stable refuse. It is a slender rod-shaped bacillus, with a single large spore at one end giving it the shape of a drum-stick (Fig. 26). The spores, which are the active agents in producing tetanus, are highly resistant to chemical agents, retain their vitality in a dry condition, and even survive boiling for five minutes.

The organism does not readily establish itself in the human body, and seems to flourish best when it finds a nidus in necrotic tissue and is accompanied by aerobic organisms, which, by using up the oxygen in the tissues, provide for it a suitable environment. The presence of a foreign body in the wound seems to favour its action. The infection is for all practical purposes a local one, the symptoms of the disease being due to the toxins produced in the wound of infection acting upon the central nervous system.

The toxin acts principally on the nerve centres in the spinal medulla, to which it travels from the focus of infection by way of the nerve fibres supplying the voluntary muscles. Its first effect on the motor ganglia of the cord is to render them hypersensitive, so that they are excited by mild stimuli, which under ordinary conditions would produce no reaction. As the toxin accumulates the reflex arc is affected, with the result that when a stimulus reaches the ganglia a motor discharge takes place, which spreads by ascending and descending collaterals to the reflex apparatus of the whole cord. As the toxin spreads it causes both motor hyper-tonus and hyper-excitability, which accounts for the tonic contraction and the clonic spasms characteristic of tetanus.

[Illustration: FIG. 26.--Bacillus of Tetanus from scraping of a wound of finger, x 1000 diam. Basic fuchsin stain.]

#Clinical Varieties of Tetanus.#--Acute_ or Fulminating Tetanus.--This variety is characterised by the shortness of the incubation period, the rapidity of its progress, the severity of its symptoms, and its all but universally fatal issue in spite of treatment, death taking place in from one to four days. The characteristic symptoms may appear within three or four days of the infliction of the wound, but the incubation period may extend to three weeks, and the wound may be quite healed before the disease declares itself--delayed tetanus. Usually, however, the wound is inflamed and suppurating, with ragged and sloughy edges. A slight feverish attack may mark the onset of the tetanic condition, or the patient may feel perfectly well until the spasms begin. If careful observations be made, it may be found that the muscles in the immediate neighbourhood of the wound are the first to become contracted; but in the majority of instances the patient's first complaint is of pain and stiffness in the muscles of mastication, notably the masseter, so that he has difficulty in opening the mouth--hence the popular name "lock-jaw." The muscles of expression soon share in the rigidity, and the face assumes a taut,

mask-like aspect. The angles of the mouth may be retracted, producing a grinning expression known as the risus sardonicus.

The next muscles to become stiff and painful are those of the neck, especially the sterno-mastoid and trapezius. The patient is inclined to attribute the pain and stiffness to exposure to cold or rheumatism. At an early stage the diaphragm and the muscles of the anterior abdominal wall become contracted; later the muscles of the back and thorax are involved; and lastly those of the limbs. Although this is the typical order of involvement of the different groups of muscles, it is not always adhered to.

To this permanent tonic contraction of the muscles there are soon added clonic spasms. These spasms are at first slight and transient, with prolonged intervals between the attacks, but rapidly tend to become more frequent, more severe, and of longer duration, until eventually the patient simply passes out of one seizure into another.

The distribution of the spasms varies in different cases: in some it is confined to particular groups of muscles, such as those of the neck, back, abdominal walls, or limbs; in others all these groups are simultaneously involved.

When the muscles of the back become spasmodically contracted, the body is raised from the bed, sometimes to such an extent that the patient rests only on his heels and occiput--the position of opisthotonus. Lateral arching of the body from excessive action of the muscles on one side--pleurosthotonus--is not uncommon, the arching usually taking place towards the side on which the wound of infection exists. Less frequently the body is bent forward so that the knees and chin almost meet (emprosthotonus). Sometimes all the muscles simultaneously become rigid, so that the body assumes a statuesque attitude (orthotonus). When the thoracic muscles, including the diaphragm, are thrown into spasm, the patient experiences a distressing sensation as if he were gripped in a vice, and has extreme difficulty in getting breath. Between the attacks the limbs are kept rigidly extended. The clonic spasms may be so severe as to rupture muscles or even to fracture one of the long bones.

As time goes on, the clonic exacerbations become more and more frequent, and the slightest external stimulus, such as the feeling of the pulse, a whisper in the room, a noise in the street, a draught of cold air, the effort to swallow, a question addressed to the patient or his attempt to answer, is sufficient to determine an attack. The movements are so forcible and so continuous that the nurse has great difficulty in keeping the bedclothes on the patient, or even in keeping him in bed.

The general condition of the patient is pitiful in the extreme. He is fully conscious of the gravity of the disease, and his mind remains clear to the end. The suffering induced by the cramp-like spasms of the muscles keeps him in a constant state of fearful apprehension of the next seizure, and he is unable to sleep until he becomes utterly exhausted.

The temperature is moderately raised (100 ° to 102 ° F.), or may remain normal throughout. Shortly before death very high temperatures (110 ° F.) have been recorded, and it has been observed that the thermometer sometimes continues to rise after death, and may reach as high as 112 ° F. or more.

The pulse corresponds with the febrile condition. It is accelerated during the spasms, and may become exceedingly rapid and feeble before death, probably from paralysis of the vagus. Sudden death from cardiac paralysis or from cardiac spasm is not uncommon.

The respiration is affected in so far as the spasms of the respiratory muscles produce dyspnoea, and a feeling of impending suffocation which adds to the horrors of the disease.

One of the most constant symptoms is a copious perspiration, the patient

being literally bathed in sweat. The urine is diminished in quantity, but as a rule is normal in composition; as in other acute infective conditions, albumen and blood may be present. Retention of urine may result from spasm of the urethral muscles, and necessitate the use of the catheter.

The fits may cease some time before death, or, on the other hand, death may occur during a paroxysm from fixation of the diaphragm and arrest of respiration.

Differential Diagnosis.--There is little difficulty, as a rule, in diagnosing a case of fulminating tetanus, but there are several conditions with which it may occasionally be confused. In strychnin poisoning, for example, the spasms come on immediately after the patient has taken a toxic dose of the drug; they are clonic in character, but the muscles are relaxed between the fits. If the dose is not lethal, the spasms soon cease. In hydrophobia a history of having been bitten by a rabid animal is usually forthcoming; the spasms, which are clonic in character, affect chiefly the muscles of respiration and deglutition, and pass off entirely in the intervals between attacks. Certain cases of haemorrhage into the lateral ventricles of the brain also simulate tetanus, but an analysis of the symptoms will prevent errors in diagnosis. Cerebro-spinal meningitis and basal meningitis present certain superficial resemblances to tetanus, but there is no trismus, and the spasms chiefly affect the muscles of the neck and back. Hysteria and catalepsy may assume characters resembling those of tetanus, but there is little difficulty in distinguishing between these diseases. Lastly, in the tetany of children, or that following operations on the thyroid gland, the spasms are of a jerking character, affect chiefly the hands and fingers, and yield to medicinal treatment.

#Chronic Tetanus.#--The difference between this and acute tetanus is mainly one of degree. Its incubation period is longer, it is more slow and insidious in its progress, and it never reaches the same degree of severity. Trismus is the most marked and constant form of spasm; and while the trunk muscles may be involved, those of respiration as a rule escape. Every additional day the patient lives adds to the probability of his ultimate recovery. When the disease does prove fatal, it is from exhaustion, and not from respiratory or cardiac spasm. The usual duration is from six to ten weeks.

#Delayed Tetanus.#--During the European War acute tetanus occasionally developed many weeks or even months after a patient had been injured, and when the original wound had completely healed. It usually followed some secondary operation, e.g., for the removal of a foreign body, or the breaking down of adhesions, which aroused latent organisms.

#Local Tetanus.#--This term is applied to a form of the disease in which the hypertonus and spasms are localised to the muscles in the vicinity of the wound. It usually occurs in patients who have had prophylactic injections of anti-tetanic serum, the toxins entering the blood being probably neutralised by the antibodies in circulation, while those passing along the motor nerves are unaffected.

When it occurs in the limbs, attention is usually directed to the fact by pain accompanying the spasms; the muscles are found to be hard and there are frequent twitchings of the limb. A characteristic reflex is present in the lower extremity, namely, extension of the foot and leg when the sole is tickled.

Cephalic Tetanus is another localised variety which follows injury in the distribution of the facial nerve. It is characterised by the occurrence on the same side as the injury, of facial spasm, rapidly followed by more or less complete paralysis of the muscles of expression, with unilateral trismus and difficulty in swallowing. Other cranial nerves, particularly the oculomotor and the hypoglossal, may also be implicated. A remarkable feature of this condition is that although the muscles are irresponsible to ordinary physiological stimuli, they are thrown into spasm by the abnormal impulses of tetanus.

Trismus.--This term is used to denote a form of tetanic spasm limited to the muscles of mastication. It is really a mild form of chronic tetanus, and the prognosis is favourable. It must not be confused with the fixation of the jaw sometimes associated with a wisdom-tooth gumboil, with tonsillitis, or with affections of the temporo-mandibular articulation.

Tetanus neonatorum is a form of tetanus occurring in infants of about a week old. Infection takes place through the umbilicus, and manifests itself clinically by spasms of the muscles of mastication. It is almost invariably fatal within a few days.

Prophylaxis.--Experience in the European War has established the fact that the routine injection of anti-tetanic serum to all patients with lacerated and contaminated wounds greatly reduces the frequency of tetanus. The sooner the serum is given after the injury, the more certain is its effect; within twenty-four hours 1500 units injected subcutaneously is sufficient for the initial dose; if a longer period has elapsed, 2000 to 3000 units should be given intra-muscularly, as this ensures more rapid absorption. A second injection is given a week after the first.

The wound must be purified in the usual way, and all instruments and appliances used for operations on tetanic patients must be immediately sterilised by prolonged boiling.

Treatment.--When tetanus has developed the main indications are to prevent the further production of toxins in the wound, and to neutralise those that have been absorbed into the nervous system. Thorough purification with antiseptics, excision of devitalised tissues, and drainage of the wound are first carried out. To arrest the absorption of toxins intra-muscular injections of 10,000 units of serum are given daily into the muscles of the affected limb, or directly into the nerve trunks leading from the focus of infection, in the hope of "blocking" the nerves with antitoxin and so preventing the passage of toxins towards the spinal cord.

To neutralise the toxins that have already reached the spinal cord, 5000 units should be injected intra-theccally daily for four or five days, the foot of the bed being raised to enable the serum to reach the upper parts of the cord.

The quantity of toxin circulating in the blood is so small as to be practically negligible, and the risk of anaphylactic shock attending intra-venous injection outweighs any benefit likely to follow this procedure.

Bacelli recommends the injection of 20 c.c. of a 1 in 100 solution of carbolic acid into the subcutaneous tissues every four hours during the period that the contractions persist. Opinions vary as to the efficiency of this treatment. The intra-thecal injection of 10 c.c. of a 15 per cent. solution of magnesium sulphate has proved beneficial in alleviating the severity of the spasms, but does not appear to have a curative effect.

To conserve the patient's strength by preventing or diminishing the severity of the spasms, he should be placed in a quiet room, and every form of disturbance avoided. Sedatives, such as bromides, paraldehyde, or opium, must be given in large doses. Chloral is perhaps the best, and the patient should rarely have less than 150 grains in twenty-four hours. When he is unable to swallow, it should be given by the rectum. The administration of chloroform is of value in conserving the strength of the patient, by abolishing the spasms, and enabling the attendants to administer nourishment or drugs either through a stomach tube or by the rectum. Extreme elevation of temperature is met by tepid sponging. It is necessary to use the catheter if retention of urine occurs.

HYDROPHOBIA

Hydrophobia is an acute infective disease following on the bite of a rabid animal. It most commonly follows the bite or lick of a rabid dog or cat. The virus appears to be communicated through the saliva of the animal, and to show a marked affinity for nerve tissues; and the disease is most likely to develop when the patient is infected on the face or other uncovered part, or in a part richly endowed with nerves.

A dog which has bitten a person should on no account be killed until its condition has been proved one way or the other. Should rabies develop and its destruction become necessary, the head and spinal cord should be retained and forwarded, packed in ice, to a competent observer. Much anxiety to the person bitten and to his friends would be avoided if these rules were observed, because in many cases it will be shown that the animal did not after all suffer from rabies, and that the patient consequently runs no risk. If, on the other hand, rabies is proved to be present, the patient should be submitted to the Pasteur treatment.

Clinical Features.--There is almost always a history of the patient having been bitten or licked by an animal supposed to suffer from rabies. The incubation period averages about forty days, but varies from a fortnight to seven or eight months, and is shorter in young than in old persons. The original wound has long since healed, and beyond a slight itchiness or pain shooting along the nerves of the part, shows no sign of disturbance. A few days of general malaise, with chills and giddiness precede the onset of the acute manifestations, which affect chiefly the muscles of deglutition and respiration. One of the earliest signs is that the patient has periodically a sudden catch in his breathing "resembling what often occurs when a person goes into a cold bath." This is due to spasm of the diaphragm, and is frequently accompanied by a loud-sounding hiccup, likened by the laity to the barking of a dog. Difficulty in swallowing fluids may be the first symptom.

The spasms rapidly spread to all the muscles of deglutition and respiration, so that the patient not only has the greatest difficulty in swallowing, but has a constant sense of impending suffocation. To add to his distress, a copious secretion of viscid saliva fills his mouth. Any voluntary effort, as well as all forms of external stimuli, only serve to aggravate the spasms which are always induced by the attempt to swallow fluid, or even by the sound of running water.

The temperature is raised; the pulse is small, rapid, and intermittent; and the urine may contain sugar and albumen.

The mind may remain clear to the end, or the patient may have delusions, supposing himself to be surrounded by terrifying forms. There is always extreme mental agitation and despair, and the sufferer is in constant fear of his impending fate. Happily the inevitable issue is not long delayed, death usually occurring in from two to four days from the onset. The symptoms of the disease are so characteristic that there is no difficulty in diagnosis. The only condition with which it is liable to be confused is the variety of cephalic tetanus in which the muscles of deglutition are specially involved--the so-called tetanus hydrophobicus.

Prophylaxis.--The bite of an animal suspected of being rabid should be cauterised at once by means of the actual or Paquelin cautery, or by a strong chemical escharotic such as pure carbolic acid, after which antiseptic dressings are applied.

It is, however, to Pasteur's preventive inoculation that we must look for our best hope of averting the onset of symptoms. "It may now be taken as established that a grave responsibility rests on those concerned if a person bitten by a mad animal is not subjected to the Pasteur treatment" (Muir and Ritchie).

This method is based on the fact that the long incubation period of the disease admits of the patient being inoculated with a modified virus producing a mild attack, which protects him from the natural disease.

Treatment. --When the symptoms have once developed they can only be palliated. The patient must be kept absolutely quiet and free from all sources of irritation. The spasms may be diminished by means of chloral and bromides, or by chloroform inhalation.

ANTHRAX

Anthrax is a comparatively rare disease, communicable to man from certain of the lower animals, such as sheep, oxen, horses, deer, and other herbivora. In animals it is characterised by symptoms of acute general poisoning, and, from the fact that it produces a marked enlargement of the spleen, is known in veterinary surgery as "splenic fever."

The bacillus anthracis (Fig. 27), the largest of the known pathogenic bacteria, occurs in groups or in chains made up of numerous bacilli, each bacillus measuring from 6 to 8 u in length. The organisms are found in enormous numbers throughout the bodies of animals that have died of anthrax, and are readily recognised and cultivated. Sporulation only takes place outside the body, probably because free oxygen is necessary to the process. In the spore-free condition, the organisms are readily destroyed by ordinary germicides, and by the gastric juice. The spores, on the other hand, have a high degree of resistance. Not only do they remain viable in the dry state for long periods, even up to a year, but they survive boiling for five minutes, and must be subjected to dry heat at 140 o C. for several hours before they are destroyed.

[Illustration: FIG. 27.--Bacillus of Anthrax in section of skin, from a case of malignant pustule; shows vesicle containing bacilli. x 400 diam. Gram's stain.]

Clinical Varieties of Anthrax.--In man, anthrax may manifest itself in one of three clinical forms.

It may be transmitted by means of spores or bacilli directly from a diseased animal to those who, by their occupation or otherwise, are brought into contact with it--for example, shepherds, butchers, veterinary surgeons, or hide-porters. Infection may occur on the face by the use of a shaving-brush contaminated by spores. The path of infection is usually through an abrasion of the skin, and the primary manifestations are local, constituting what is known as the malignant pustule.

In other cases the disease is contracted through the inhalation of the dried spores into the respiratory passages. This occurs oftenest in those who work amongst wool, fur, and rags, and a form of acute pneumonia of great virulence ensues. This affection is known as wool-sorter's disease, and is almost universally fatal.

There is reason to believe that infection may also take place by means of spores ingested into the alimentary canal in meat or milk derived from diseased animals, or in infected water.

#Clinical Features of Malignant Pustule.#--We shall here confine ourselves to the consideration of the local lesion as it occurs in the skin--the malignant pustule.

The point of infection is usually on an uncovered part of the body, such as the face, hands, arms, or back of the neck, and the wound may be exceedingly minute. After an incubation period varying from a few hours to several days, a reddish nodule resembling a small boil appears at the seat of inoculation, the immediately surrounding skin becomes swollen and indurated, and over the indurated area there appear a number of small vesicles containing serum, which at first is clear but soon becomes blood-stained (Fig. 28). Coincidently the subcutaneous tissue for a considerable distance around becomes markedly oedematous, and the skin red and tense. Within a few hours, blood is extravasated in the centre of the indurated area, the blisters burst, and a dark brown or black eschar, composed of necrosed skin and subcutaneous tissue and

altered blood, forms (Fig. 29). Meanwhile the induration extends, fresh vesicles form and in turn burst, and the eschar increases in size. The neighbouring lymph glands soon become swollen and tender. The affected part is hot and itchy, but the patient does not complain of great pain. There is a moderate degree of constitutional disturbance, with headache, nausea, and sometimes shivering.

If the infection becomes generalised--anthracæmia--the temperature rises to 103° or 104° F., the pulse becomes feeble and rapid, and other signs of severe blood-poisoning appear: vomiting, diarrhoea, pains in the limbs, headache and delirium, and the condition proves fatal in from five to eight days.

Differential Diagnosis.--When the malignant pustule is fully developed, the central slough with the surrounding vesicles and the widespread oedema are characteristic. The bacillus can be obtained from the peripheral portion of the slough, from the blisters, and from the adjacent lymph vessels and glands. The occupation of the patient may suggest the possibility of anthrax infection.

[Illustration: FIG. 28.--Malignant Pustule, third day after infection with Anthrax, showing great oedema of upper extremity and pectoral region (cf. Fig. 29).]

[Illustration: FIG. 29.--Malignant Pustule, fourteen days after infection, showing black eschar in process of separation. The oedema has largely disappeared. Treated by Sclavo's serum (cf. Fig. 28).]

Prophylaxis.--Any wound suspected of being infected with anthrax should at once be cauterised with caustic potash, the actual cautery, or pure carbolic acid.

Treatment.--The best results hitherto obtained have followed the use of the anti-anthrax serum introduced by Sclavo. The initial dose is 40 c.c., and if the serum is given early in the disease, the beneficial effects are manifest in a few hours. Favourable results have also followed the use of pyocyanase, a vaccine prepared from the bacillus *pyocyaneus*.

By some it is recommended that the local lesion should be freely excised; others advocate cauterisation of the affected part with solid caustic potash till all the indurated area is softened. Graf has had excellent results by the latter method in a large series of cases, the oedema subsiding in about twenty-four hours and the constitutional symptoms rapidly improving. Wolff and Wiewiorowski, on the other hand, have had equally good results by simply protecting the local lesion with a mild antiseptic dressing, and relying upon general treatment.

The general treatment consists in feeding and stimulating the patient as freely as possible. Quinine, in 5 to 10 grain doses every four hours, and powdered ipecacuanha, in 40 to 60 grain doses every four hours, have also been employed with apparent benefit.

GLANDERS

Glanders is due to the action of a specific bacterium, the *bacillus mallei*, which resembles the tubercle bacillus, save that it is somewhat shorter and broader, and does not stain by Gram's method. It requires higher temperatures for its cultivation than the tubercle bacillus, and its growth on potato is of a characteristic chocolate-brown colour, with a greenish-yellow ring at the margin of the growth. The *bacillus mallei* retains its vitality for long periods under ordinary conditions, but is readily killed by heat and chemical agents. It does not form spores.

Clinical Features.--Both in the lower animals and in man the *bacillus mallei* gives rise to two distinct types of disease--acute glanders, and chronic glanders or farcy.

Acute Glanders is most commonly met with in the horse and in other

equine animals, horned cattle being immune. It affects the septum of the nose and adjacent parts, firm, translucent, greyish nodules containing lymphoid and epithelioid cells appearing in the mucous membrane. These nodules subsequently break down in the centre, forming irregular ulcers, which are attended with profuse discharge, and marked inflammatory swelling. The cervical lymph glands, as well as the lungs, spleen, and liver, may be the seat of secondary nodules.

In man, acute glanders is commoner than the chronic variety. Infection always takes place through an abraded surface, and usually on one of the uncovered parts of the body--most commonly the skin of the hands, arms, or face; or on the mucous membrane of the mouth, nose, or eye. The disease has been acquired by accidental inoculation in the course of experimental investigations in the laboratory, and proved fatal. The incubation period is from three to five days.

The local manifestations are pain and swelling in the region of the infected wound, with inflammatory redness around it and along the lines of the superficial lymphatics. In the course of a week, small, firm nodules appear, and are rapidly transformed into pustules. These may occur on the face and in the vicinity of joints, and may be mistaken for the eruption of small-pox.

After breaking down, these pustules give rise to irregular ulcers, which by their confluence lead to extensive destruction of skin. Sometimes the nasal mucous membrane becomes affected, and produces a discharge--at first watery, but later sanious and purulent. Necrosis of the bones of the nose may take place, in which case the discharge becomes peculiarly offensive. In nearly every case metastatic abscesses form in different parts of the body, such as the lungs, joints, or muscles.

During the development of the disease the patient feels ill, complains of headache and pains in the limbs, the temperature rises to 104° or even to 106° F., and assumes a pyaemic type. The pulse becomes rapid and weak. The tongue is dry and brown. There is profuse sweating, albuminuria, and often insomnia with delirium. Death may take place within a week, but more frequently occurs during the second or third week.

Differential Diagnosis.--There is nothing characteristic in the site of the primary lesion in man, and the condition may, during the early stages, be mistaken for a boil or carbuncle, or for any acute inflammatory condition. Later, the disease may simulate acute articular rheumatism, or may manifest all the symptoms of acute septicaemia or pyaemia. The diagnosis is established by the recognition of the bacillus. Veterinary surgeons attach great importance to the mallein test as a means of diagnosis in animals, but in the human subject its use is attended with considerable risk and is not to be recommended.

Treatment.--Excision of the primary nodule, followed by the application of the thermo-cautery and sponging with pure carbolic acid, should be carried out, provided the condition is sufficiently limited to render complete removal practicable.

When secondary abscesses form in accessible situations, they must be incised, disinfected, and drained. The general treatment is carried out on the same lines as in other acute infective diseases.

#Chronic Glanders.#--In the horse_ the chronic form of glanders is known as farcy, and follows infection through an abrasion of the skin, involving chiefly the superficial lymph vessels and glands. The lymphatics become indurated and nodular, constituting what veterinarians call farcy pipes and farcy buds.

In man also the clinical features of the chronic variety of the disease are somewhat different from those of the acute form. Here, too, infection takes place through a broken cutaneous surface, and leads to a superficial lymphangitis with nodular thickening of the lymphatics (farcy buds). The neighbouring glands soon become swollen and indurated. The primary lesion meanwhile inflames, suppurates, and, after

breaking down, leaves a large, irregular ulcer with thickened edges and a foul, purulent or bloody discharge. The glands break down in the same way, and lead to wide destruction of skin, and the resulting sinuses and ulcers are exceedingly intractable. Secondary deposits in the subcutaneous tissue, the muscles, and other parts, are not uncommon, and the nasal mucous membrane may become involved. The disease often runs a chronic course, extending to four or five months, or even longer.

Recovery takes place in about 50 per cent. of cases, but the convalescence is prolonged, and at any time the disease may assume the characters of the acute variety and speedily prove fatal.

The differential diagnosis is often difficult, especially in the chronic nodules, in which it may be impossible to demonstrate the bacillus. The ulcerated lesions of farcy have to be distinguished from those of tubercle, syphilis, and other forms of infective granuloma.

Treatment.--Limited areas of disease should be completely excised. The general condition of the patient must be improved by tonics, good food, and favourable hygienic surroundings. In some cases potassium iodide acts beneficially.

ACTINOMYCOSIS

Actinomycosis is a chronic disease due to the action of an organism somewhat higher in the vegetable scale than ordinary bacteria--the streptothrix actinomyces or ray fungus.

[Illustration: FIG. 30.--Section of Actinomycosis Colony in Pus from Abscess of Liver, showing filaments and clubs of streptothrix actinomyces. x 400 diam. Gram's stain.]

Etiology and Morbid Anatomy.--The actinomycetes, which has never been met with outside the body, gives rise in oxen, horses, and other animals to tumour-like masses composed of granulation tissue; and in man to chronic suppurative processes which may result in a condition resembling chronic pyaemia. The actinomycetes is more complex in structure than other pathogenic organisms, and occurs in the tissues in the form of small, round, semi-translucent bodies, about the size of a pin-head or less, and consisting of colonies of the fungus. On account of their yellow tint they are spoken of as "sulphur grains." Each colony is made up of a series of thin, interlacing, and branching filaments, some of which are broken up so as to form masses or chains of cocci; and around the periphery of the colony are elongated, pear-shaped, hyaline, club-like bodies (Fig. 30).

Infection is believed to be conveyed by the husks of cereals, especially barley; and the organism has been found adhering to particles of grain embedded in the tissues of animals suffering from the disease. In the human subject there is often a history of exposure to infection from such sources, and the disease is said to be most common during the harvesting months.

Around each colony of actinomycetes is a zone of granulation tissue in which suppuration usually occurs, so that the fungus comes to lie in a bath of greenish-yellow pus. As the process spreads these purulent foci become confluent and form abscess cavities. When metastasis takes place, as it occasionally does, the fungus is transmitted by the blood vessels, as in pyaemia.

Clinical features.--In man the disease may be met with in the skin, the organisms gaining access through an abrasion, and spreading by the formation of new nodules in the same way as tuberculosis.

The region of the mouth and jaws is one of the commonest sites of surgical actinomycosis. Infection takes place, as a rule, along the side of a carious tooth, and spreads to the lower jaw. A swelling is slowly and insidiously developed, but when the loose connective tissue of the neck becomes infiltrated, the spread is more rapid. The whole region becomes infiltrated and swollen, and the skin ultimately gives way and

free suppuration occurs, resulting in the formation of sinuses. The characteristic greenish-grey or yellow granules are seen in the pus, and when examined microscopically reveal the colonies of actinomycetes.

Less frequently the maxilla becomes affected, and the disease may spread to the base of the skull and brain. The vertebrae may become involved by infection taking place through the pharynx or oesophagus, and leading to a condition simulating tuberculous disease of the spine. When it implicates the intestinal canal and its accessory glands, the lungs, pleura, and bronchial tubes, or the brain, the disease is not amenable to surgical treatment.

Differential Diagnosis.--The conditions likely to be mistaken for surgical actinomycosis are sarcoma, tubercle, and syphilis. In the early stages the differential diagnosis is exceedingly difficult. In many cases it is only possible when suppuration has occurred and the fungus can be demonstrated.

The slow destruction of the affected tissue by suppuration, the absence of pain, tenderness, and redness, simulate tuberculosis, but the absence of glandular involvement helps to distinguish it.

Syphilitic lesions are liable to be mistaken for actinomycosis, all the more that in both diseases improvement follows the administration of iodides. When it affects the lower jaw, in its early stages, actinomycosis may closely simulate a periosteal sarcoma.

[Illustration: FIG. 31.--Actinomycosis of Maxilla. The disease spread to opposite side; finally implicated base of skull, and proved fatal.
Treated by radium.

(Mr. D. P. D. Wilkie's case.)]

The recognition of the fungus is the crucial point in diagnosis.

Prognosis.--Spontaneous cure rarely occurs. When the disease implicates internal organs, it is almost always fatal. On external parts the destructive process gradually spreads, and the patient eventually succumbs to superadded septic infection. When, from its situation, the primary focus admits of removal, the prognosis is more favourable.

Treatment.--The surgical treatment is early and free removal of the affected tissues, after which the wound is cauterised by the actual cautery, and sponged over with pure carbolic acid. The cavity is packed with iodoform gauze, no attempt being made to close the wound.

Success has attended the use of a vaccine prepared from cultures of the organism; and the X-rays and radium, combined with the administration of iodides in large doses, or with intra-muscular injections of a 10 per cent. solution of cacodylate of soda, have proved of benefit.

MYCETOMA, OR MADURA FOOT.--Mycetoma is a chronic disease due to an organism resembling that of actinomycosis, but not identical with it. It is endemic in certain tropical countries, and is most frequently met with in India. Infection takes place through an abrasion of the skin, and the disease usually occurs on the feet of adult males who work barefooted in the fields.

Clinical Features.--The disease begins on the foot as an indurated patch, which becomes discoloured and permeated by black or yellow nodules containing the organism. These nodules break down by suppuration, and numerous minute abscesses lined by granulation tissues are thus formed. In the pus are found yellow particles likened to fish-roe, or black pigmented granules like gunpowder. Sinuses form, and the whole foot becomes greatly swollen and distorted by flattening of the sole and dorsiflexion of the toes. Areas of caries or necrosis occur in the bones, and the disease gradually extends up the leg (Fig. 32). There is but little pain, and no glandular involvement or constitutional disturbance. The disease runs a prolonged course, sometimes lasting for twenty or thirty years. Spontaneous cure never takes place, and the risk

to life is that of prolonged suppuration.

If the disease is localised, it may be removed by the knife or sharp spoon, and the part afterwards cauterised. As a rule, amputation well above the disease is the best line of treatment. Unlike actinomycosis, this disease does not appear to be benefited by iodides.

[Illustration: FIG. 32.--Mycetoma, or Madura Foot. (Museum of Royal College of Surgeons, Edinburgh.)]

DELHI BOIL.--_Synonyms--Aleppo boil, Biskra button, Furunculus orientalis, Natal sore.

Delhi boil is a chronic inflammatory disease, most commonly met with in India, especially towards the end of the wet season. The disease occurs oftenest on the face, and is believed to be due to an organism, although this has not been demonstrated. The infection is supposed to be conveyed through water used for washing, or by the bites of insects.

Clinical Features.--A red spot, resembling the mark of a mosquito bite, appears on the affected part, and is attended with itching. After becoming papular and increasing to the size of a pea, desquamation takes place, leaving a dull-red surface, over which in the course of several weeks there develops a series of small yellowish-white spots, from which serum exudes, and, drying, forms a thick scab. Under this scab the skin ulcerates, leaving small oval sores with sharply bevelled edges, and an uneven floor covered with yellow or sanguous pus. These sores vary in number from one to forty or fifty. They may last for months and then heal spontaneously, or may continue to spread until arrested by suitable treatment. There is no enlargement of adjacent glands, and but little inflammatory reaction in the surrounding tissues; nor is there any marked constitutional disturbance. Recovery is often followed by cicatricial contraction leading to deformity of the face.

The _treatment_ consists in destroying the original papule by the actual cautery, acid nitrate of mercury, or pure carbolic acid. The ulcers should be scraped with the sharp spoon, and cauterised.

CHIGOE.--Chigoe or jigger results from the introduction of the eggs of the sand-flea (Pulex penetrans) into the tissues. It occurs in tropical Africa, South America, and the West Indies. The impregnated female flea remains attached to the part till the eggs mature, when by their irritation they cause localised inflammation with pustules or vesicles on the surface. Children are most commonly attacked, particularly about the toe-nails and on the scrotum. The treatment consists in picking out the insect with a blunt needle, special care being taken not to break it up. The puncture is then cauterised. The application of essential oils to the feet acts as a preventive.

POISONING BY INSECTS.--The bites of certain insects, such as mosquitoes, midges, different varieties of flies, wasps, and spiders, may be followed by serious complications. The effects are mainly due to the injection of an irritant acid secretion, the exact nature of which has not been ascertained.

The local lesion is a puncture, surrounded by a zone of hyperaemia, wheals, or vesicles, and is associated with burning sensations and itching which usually pass off in a few hours, but may recur at intervals, especially when the patient is warm in bed. Scratching also reproduces the local signs and symptoms. Where the connective tissue is loose--for example, in the eyelid or scrotum--there is often considerable swelling; and in the mouth and fauces this may lead to oedema of the glottis, which may prove fatal.

The _treatment_ consists in the local application of dilute alkalies such as ammonia water, solutions of carbonate or bicarbonate of soda, or sal-volatile. Weak carbolic lotions, or lead and opium lotion, are useful in allaying the local irritation. One of the best means of neutralising the poison is to apply to the sting a drop of a mixture containing equal parts of pure carbolic acid and liquor ammoniae.

Free stimulation is called for when severe constitutional symptoms are present.

SNAKE-BITES.--We are here only concerned with the injuries inflicted by the venomous varieties of snakes, the most important of which are the hooded snakes of India, the rattle-snakes of America, the horned snakes of Africa, the viper of Europe, and the adder of the United Kingdom.

While the virulence of these creatures varies widely, they are all capable of producing in a greater or less degree symptoms of acute poisoning in man and other animals. By means of two recurved fangs attached to the upper jaw, and connected by a duct with poison-secreting glands, they introduce into their prey a thick, transparent, yellowish fluid, of acid reaction, probably of the nature of an albumose, and known as the venom.

The clinical features resulting from the injection of the venom vary directly in intensity with the amount of the poison introduced, and the rapidity with which it reaches the circulating blood, being most marked when it immediately enters a large vein. The poison is innocuous when taken into the stomach.

Locally the snake inflicts a double wound, passing vertically into the subcutaneous tissue; the edges of the punctures are ecchymosed, and the adjacent vessels the seat of thrombosis. Immediately there is intense pain, and considerable swelling with congestion, which tends to spread towards the trunk. Extensive gangrene may ensue. There is no special involvement of the lymphatics.

The general symptoms may come on at once if the snake is a particularly venomous one, or not for some hours if less virulent. In the majority of viper or adder bites the constitutional disturbance is slight and transient, if it appears at all. Snake-bites in children are particularly dangerous.

The patient's condition is one of profound shock with faintness, giddiness, dimness of sight, and a feeling of great terror. The pupils dilate, the skin becomes moist with a clammy sweat, and nausea with vomiting, sometimes of blood, ensues. High fever, cramps, loss of sensation, haematuria, and melaena are among the other symptoms that may be present. The pulse becomes feeble and rapid, the respiratory nerve centres are profoundly depressed, and delirium followed by coma usually precedes the fatal issue, which may take place in from five to forty-eight hours. If the patient survives for two days the prognosis is favourable.

Treatment.--A broad ligature should be tied tightly round the limb above the seat of infection, to prevent the poison passing into the general circulation, and bleeding from the wound should be encouraged. The application of an elastic bandage from above downward to empty the blood out of the infected portion of the limb has been recommended. The whole of the bite should at once be excised, and crystals of permanganate of potash rubbed into the wound until it is black, or peroxide of hydrogen applied with the object of destroying the poison by oxidation.

The general treatment consists in free stimulation with whisky, brandy, ammonia, digitalis, etc. Hypodermic injections of strychnin in doses sufficiently large to produce a slight degree of poisoning by the drug are particularly useful. The most rational treatment, when it is available, is the use of the antivenin introduced by Fraser and Calmette.

CHAPTER VIII

TUBERCULOSIS

Tubercle bacillus--Methods of infection--Inherited and acquired predisposition--Relationship of tuberculosis to injury--Human and bovine tuberculosis--Action of the bacillus upon the tissues--Tuberculous granulation tissue--Natural cure--Recrudescence of the disease--THE TUBERCULOUS ABSCESS--Contents and wall of the abscess--Tuberculous sinuses.

Tuberculosis occurs more frequently in some situations than in others; it is common, for example, in lymph glands, in bones and joints, in the peritoneum, the intestine, the kidney, prostate and testis, and in the skin and subcutaneous cellular tissue; it is seldom met with in the breast or in muscles, and it rarely affects the ovary, the pancreas, the parotid, or the thyreoid.

Tubercle bacilli vary widely in their virulence, and they are more tenacious of life than the common pyogenic bacteria. In a dry state, for example, they can retain their vitality for months; and they can also survive immersion in water for prolonged periods. They resist the action of the products of putrefaction for a considerable time, and are not destroyed by digestive processes in the stomach and intestine. They may be killed in a few minutes by boiling, or by exposure to steam under pressure, or by immersion for less than a minute in 1 in 20 carbolic lotion.

#Methods of Infection.#--In marked contrast to what obtains in the infective diseases that have already been described, tuberculosis rarely results from the infection of a wound. In exceptional instances, however, this does occur, and in illustration of the fact may be cited the case of a servant who cut her finger with a broken spittoon containing the sputum of her consumptive master; the wound subsequently showed evidence of tuberculous infection, which ultimately spread up along the lymph vessels of the arm. Pathologists, too, whose hands, before the days of rubber gloves, were frequently exposed to the contact of tuberculous tissues and pus, were liable to suffer from a form of tuberculosis of the skin of the finger, known as anatomical tubercle. Slight wounds of the feet in children who go about barefoot in towns sometimes become infected with tubercle. Operation wounds made with instruments contaminated with tuberculous material have also been known to become infected. It is highly probable that the common form of tuberculosis of the skin known as "lupus" arises by direct infection from without.

[Illustration: FIG. 33.--Tubercle Bacilli in caseous material x 1000 diam. Z. Neilsen stain.]

In the vast majority of cases the tubercle bacillus gains entrance to the body by way of the mucous surfaces, the organisms being either inhaled or swallowed; those inhaled are mostly derived from the human subject, those swallowed, from cattle. Bacilli, whether inhaled or swallowed, are especially apt to lodge about the pharynx and pass to the pharyngeal lymphoid tissue and tonsils, and by way of the lymph vessels to the glands. The glands most frequently infected in this way are the cervical glands, and those within the cavity of the chest--particularly the bronchial glands at the root of the lung. From these, infection extends at any later period in life to the bones, joints, and internal organs.

There is reason to believe that the organisms may lie in a dormant condition for an indefinite period in these glands, and only become active long afterwards, when some depression of the patient's health produces conditions which favour their growth. When the organisms become active in this way, the tuberculous tissue undergoes softening and disintegration, and the infective material, by bursting into an adjacent vein, may enter the blood-stream, in which it is carried to distant parts of the body. In this way a general tuberculosis may be set up, or localised foci of tuberculosis may develop in the tissues in which the organisms lodge. Many tuberculous patients are to be regarded as

possessing in their bronchial glands, or elsewhere, an internal store of bacilli, to which the disease for which advice is sought owes its origin, and from which similar outbreaks of tuberculosis may originate in the future.

The alimentary mucous membrane, especially that of the lower ileum and caecum, is exposed to infection by swallowed sputum and by food materials, such as milk, containing tubercle bacilli. The organisms may lodge in the mucous membrane and cause tuberculous ulceration, or they may be carried through the wall of the bowel into the lacteals, along which they pass to the mesenteric glands where they become arrested and give rise to tuberculous disease.

#Relationship of Tuberculosis to Trauma.--Any tissue whose vitality has been lowered by injury or disease furnishes a favourable nidus for the lodgment and growth of tubercle bacilli. The injury or disease, however, is to be looked upon as determining the localisation of the tuberculous lesion rather than as an essential factor in its causation. In a person, for example, in whose blood tubercle bacilli are circulating and reaching every tissue and organ of the body, the occurrence of tuberculous disease in a particular part may be determined by the depression of the tissues resulting from an injury of that part. There can be no doubt that excessive movement and jarring of a limb aggravates tuberculous disease of a joint; also that an injury may light up a focus that has been long quiescent, but we do not agree with those--Da Costa, for example--who maintain that injury may be a determining cause of tuberculosis. The question is not one of mere academic interest, but one that may raise important issues in the law courts.

#Human and Bovine Tuberculosis.--The frequency of the bovine bacillus in the abdominal and in the glandular and osseous tuberculous lesions of children would appear to justify the conclusion that the disease is transmissible from the ox to the human subject, and that the milk of tuberculous cows is probably a common vehicle of transmission.

#Changes in the Tissues following upon the successful Lodgment of Tubercle Bacilli.--The action of the bacilli on the tissues results in the formation of granulation tissue comprising characteristic tissue elements and with a marked tendency to undergo caseation.

The recognition of the characteristic elements, with or without caseation, is usually sufficient evidence of the tuberculous nature of any portion of tissue examined for diagnostic purposes. The recognition of the bacillus itself by appropriate methods of staining makes the diagnosis a certainty; but as it is by no means easy to identify the organism in many forms of surgical tuberculosis, it may be necessary to have recourse to experimental inoculation of susceptible animals such as guinea-pigs.

The changes subsequent to the formation of tuberculous granulation tissue are liable to many variations. It must always be borne in mind that although the bacilli have effected a lodgment and have inaugurated disease, the relation between them and the tissues remains one of mutual antagonism; which of them is to gain and keep the upper hand in the conflict depends on their relative powers of resistance.

If the tissues prevail, there ensues a process of repair. In the immediate vicinity of the area of infection young connective tissue, and later, fibrous tissue, is formed. This may replace the tuberculous tissue and bring about repair--a fibrous cicatrix remaining to mark the scene of the previous contest. Scars of this nature are frequently discovered at the apex of the lung after death in persons who have at one time suffered from pulmonary phthisis. Under other circumstances, the tuberculous tissue that has undergone caseation, or even calcification, is only encapsulated by the new fibrous tissue, like a foreign body. Although this may be regarded as a victory for the tissues, the cure, if such it may be called, is not necessarily a permanent one, for at any subsequent period, if the part affected is disturbed by injury or through some other influence, the encapsulated

tubercle may again become active and get the upper hand of the tissues, and there results a relapse or recrudescence of the disease. This tendency to relapse after apparent cure is a notable feature of tuberculous disease as it is met with in the spine, or in the hip-joint, and it necessitates a prolonged course of treatment to give the best chance of a lasting cure.

If, however, at the inauguration of the tuberculous disease the bacilli prevail, the infection tends to spread into the tissues surrounding those originally infected, and more and more tuberculous granulation tissue is formed. Finally the tuberculous tissue breaks down and liquefies, resulting in the formation of a cold abscess. In their struggle with the tissues, tubercle bacilli receive considerable support and assistance from any pyogenic organisms that may be present. A tuberculous infection may exhibit its aggressive qualities in a more serious manner by sending off detachments of bacilli, which are carried by the lymphatics to the nearest glands, or by the blood-stream to more distant, and it may be to all, parts of the body. When the infection is thus generalised, the condition is called general tuberculosis. Considering the extraordinary frequency of localised forms of surgical tuberculosis, general dissemination of the disease is rare.

#The clinical features# of surgical tuberculosis will be described with the individual tissues and organs, as they vary widely according to the situation of the lesion.

#The general treatment# consists in combating the adverse influences that have been mentioned as increasing the liability to tuberculous infection. Within recent years the value of the "open-air" treatment has been widely recognised. An open-air life, even in the centre of a city, may be followed by marked improvement, especially in the hospital class of patient, whose home surroundings tend to favour the progress of the disease. The purer air of places away from centres of population is still better; and, according to the idiosyncrasies of the individual patient, mountain air or that of the sea coast may be preferred. In view of the possible discomforts and gastric disturbance which may attend a sea-voyage, this should be recommended to patients suffering from tuberculous lesions with more caution than has hitherto been exercised. The diet must be a liberal one, and should include those articles which are at the same time easily digested and nourishing, especially proteids and fats; milk obtained from a reliable source and underdone butcher-meat are among the best. When the ordinary nourishment taken is insufficient, it may be supplemented by such articles as malt extract, stout, and cod-liver oil. The last is specially beneficial in patients who do not take enough fat in other forms. It is noteworthy that many tuberculous patients show an aversion to fat.

For the use of tuberculin in diagnosis and for the vaccine treatment of tuberculosis the reader is referred to text-books on medicine.

In addition to increasing the resisting power of the patient, it is important to enable the fluids of the body, so altered, to come into contact with the tuberculous focus. One of the obstacles to this is that the focus is often surrounded by tissues or fluids which have been almost entirely deprived of bactericidal substances. In the case of caseated glands in the neck, for example, it is obvious that the removal of this inert material is necessary before the tissues can be irrigated with fluids of high bactericidal value. Again, in tuberculous ascites the abdominal cavity is filled with a fluid practically devoid of anti-bacterial substances, so that the bacilli are able to thrive and work their will on the tissues. When the stagnant fluid is got rid of by laparotomy, the parts are immediately doused with lymph charged with protective substances, the bactericidal power of which may be many times that of the fluid displaced.

It is probable that the beneficial influence of counter-irritants, such as blisters, and exposure to the Finsen light and other forms of rays, is to be attributed in part to the increased flow of blood to the infected tissues.

Artificial Hyperaemia.--As has been explained, the induction of hyperaemia by the method devised by Bier, constitutes one of our most efficient means of combating bacterial infection. The treatment of tuberculosis on this plan has been proved by experience to be a valuable addition to our therapeutic measures, and the simplicity of its application has led to its being widely adopted in practice. It results in an increase in the reactive changes around the tuberculous focus, an increase in the immigration of leucocytes, and infiltration with the lymphocytes.

The constricting bandage should be applied at some distance above the seat of infection; for instance, in disease of the wrist, it is put on above the elbow, and it must not cause pain either where it is applied or in the diseased part. The bandage is only applied for a few hours each day, either two hours at a time or twice a day for one hour, and, while it is on, all dressings are removed save a piece of sterile gauze over any wound or sinus that may be present. The process of cure takes a long time--nine or even twelve months in the case of a severe joint affection.

In cases in which a constricting bandage is inapplicable, for example, in cold abscesses, tuberculous glands or tendon sheaths, Klapp's suction bell is employed. The cup is applied for five minutes at a time and then taken off for three minutes, and this is repeated over a period of about three-quarters of an hour. The pus is allowed to escape by a small incision, and no packing or drain should be introduced.

It has been found that tuberculous lesions tend to undergo cure when the infected tissues are exposed to the rays of the sun--heliotherapy--therefore whenever practicable this therapeutic measure should be had recourse to.

Since the introduction of the methods of treatment described above, and especially by their employment at an early stage in the disease, the number of cases of tuberculosis requiring operative interference has greatly diminished. There are still circumstances, however, in which an operation is required; for example, in disease of the lymph glands for the removal of inert masses of caseous material, in disease of bone for the removal of sequestra, or in disease of joints to improve the function of the limb. It is to be understood, however, that operative treatment must always be preceded by and combined with other therapeutic measures.

TUBERCULOUS ABSCESS

The caseation of tuberculous granulation tissue and its liquefaction is a slow and insidious process, and is unattended with the classical signs of inflammation--hence the terms "cold" and "chronic" applied to the tuberculous abscess.

In a cold abscess, such as that which results from tuberculous disease of the vertebrae, the clinical appearances are those of a soft, fluid swelling without heat, redness, pain, or fever. When toxic symptoms are present, they are usually due to a mixed infection.

A tuberculous abscess results from the disintegration and liquefaction of tuberculous granulation tissue which has undergone caseation. Fluid and cells from the adjacent blood vessels exude into the cavity, and lead to variations in the character of its contents. In some cases the contents consist of a clear amber-coloured fluid, in which are suspended fragments of caseated tissue; in others, of a white material like cream-cheese. From the addition of a sufficient number of leucocytes, the contents may resemble the pus of an ordinary abscess.

The wall of the abscess is lined with tuberculous granulation tissue, the inner layers of which are undergoing caseation and disintegration, and present a shreedy appearance; the outer layers consist of tuberculous tissue which has not yet undergone caseation. The abscess tends to increase in size by progressive liquefaction of the inner

layers, caseation of the outer layers, and the further invasion of the surrounding tissues by tubercle bacilli. In this way a tuberculous abscess is capable of indefinite extension and increase in size until it reaches a free surface and ruptures externally. The direction in which it spreads is influenced by the anatomical arrangement of the tissues, and possibly to some extent by gravity, and the abscess may reach the surface at a considerable distance from its seat of origin. The best illustration of this is seen in the psoas abscess, which may originate in the dorsal vertebrae, extend downwards within the sheath of the psoas muscle, and finally appear in the thigh.

#Clinical Features.--The insidious development of the tuberculous abscess is one of its characteristic features. The swelling may attain a considerable size without the patient being aware of its existence, and, as a matter of fact, it is often discovered accidentally. The absence of toxæmia is to be associated with the incapacity of the wall of the abscess to permit of absorption; this is shown also by the fact that when even a large quantity of iodoform is inserted into the cavity of the abscess, there are no symptoms of poisoning. The abscess varies in size from a small cherry to a cavity containing several pints of pus. Its shape also varies; it is usually that of a flattened sphere, but it may present pockets or burrows running in various directions. Sometimes it is hour-glass or dumb-bell shaped, as is well illustrated in the region of the groin in disease of the spine or pelvis, where there may be a large sac occupying the venter ilii, and a smaller one in the thigh, the two communicating by a narrow channel under Poupart's ligament. By pressing with the fingers the pus may be displaced from one compartment to the other. The usual course of events is that the abscess progresses slowly, and finally reaches a free surface--generally the skin. As it does so there may be some pain, redness, and local elevation of temperature. Fluctuation becomes evident and superficial, and the skin becomes livid and finally gives way. If the case is left to nature, the discharge of pus continues, and the track opening on the skin remains as a sinus. The persistence of suppuration is due to the presence in the wall of the abscess and of the sinus, of tuberculous granulation tissue, which, so long as it remains, continues to furnish discharge, and so prevents healing. Sooner or later pyogenic organisms gain access to the sinus, and through it to the wall of the abscess. They tend further to depress the resisting power of the tissues, and thereby aggravate and perpetuate the tuberculous disease. This superadded infection with pyogenic organisms exposes the patient to the further risks of septic intoxication, especially in the form of hectic fever and septicaemia, and increases the liability to general tuberculosis, and to waxy degeneration of the internal organs. The mixed infection is chiefly responsible for the pyrexia, sweating, and emaciation which the laity associate with consumptive disease. A tuberculous abscess may in one or other of these ways be a cause of death.

Residual abscess is the name given to an abscess that makes its appearance months, or even years, after the apparent cure of tuberculous disease--as, for example, in the hip-joint or spine. It is called residual because it has its origin in the remains of the original disease.

[Illustration: FIG. 34.--Tuberculous Abscess in right lumbar region in a woman aged thirty.]

#Diagnosis.--A cold abscess is to be diagnosed from a syphilitic gumma, a cyst, and from lipoma and other soft tumours. The differential diagnosis of these affections will be considered later; it is often made easier by recognising the presence of a lesion that is likely to cause a cold abscess, such as tuberculous disease of the spine or of the sacro-iliac joint. When it is about to burst externally, it may be difficult to distinguish a tuberculous abscess from one due to infection with pyogenic organisms. Even when the abscess is opened, the appearances of the pus may not supply the desired information, and it may be necessary to submit it to bacteriological examination. When the pus is found to be sterile, it is usually safe to assume that the condition is tuberculous, as in other forms of suppuration the causative

organisms can usually be recognised. Experimental inoculation will establish a definite diagnosis, but it implies a delay of two to three weeks.

#Treatment.--The tuberculous abscess may recede and disappear under general treatment. Many surgeons advise that so long as the abscess is quiescent it should be left alone. All agree, however, that if it shows a tendency to spread, to increase in size, or to approach the skin or a mucous membrane, something should be done to avoid the danger of its bursting and becoming infected with pyogenic organisms. Simple evacuation of the abscess by a hollow needle may suffice, or bismuth or iodoform may be introduced after withdrawal of the contents.

Evacuation of the Abscess and Injection of Iodoform.--The iodoform is employed in the form of a 10 per cent. solution in ether or the same proportion suspended in glycerin. Either form becomes sterile soon after it is prepared. Its curative effects would appear to depend upon the liberation of iodine, which restrains the activity of the bacilli, and upon its capacity for irritating the tissues and so inducing a protective leucocytosis, and also of stimulating the formation of scar tissue. An anaesthetic is rarely called for, except in children. The abscess is first evacuated by means of a large trocar and cannula introduced obliquely through the overlying soft parts, avoiding any part where the skin is thin or red. If the cannula becomes blocked with caseous material, it may be cleared with a probe, or a small quantity of saline solution is forced in by the syringe. The iodoform is injected by means of a glass-barrelled syringe, which is firmly screwed on to the cannula. The amount injected varies with the size of the abscess and the age of the patient; it may be said to range from two or three drams in the case of children to several ounces in large abscesses in adults. The cannula is withdrawn, the puncture is closed by a Michel's clip, and a dressing applied so as to exert a certain amount of compression. If the abscess fills up again, the procedure should be repeated; in doing so, the contents show the coloration due to liberated iodine. When the contents are semi-solid, and cannot be withdrawn even through a large cannula, an incision must be made, and, after the cavity has been emptied, the iodoform is introduced through a short rubber tube attached to the syringe. Experience has shown that even large abscesses, such as those associated with spinal disease, may be cured by iodoform injection, and this even when rupture of the abscess on the skin surface has appeared to be imminent.

Another method of treatment which is less popular now than it used to be, and which is chiefly applicable in abscesses of moderate size, is by incision of the abscess and removal of the tuberculous tissue in its wall with the sharp spoon. An incision is made which will give free access to the interior of the abscess, so that outlying pockets or recesses may not be overlooked. After removal of the pus, the wall of the abscess is scraped with the Volkmann spoon or with Barker's flushing spoon, to get rid of the tuberculous tissue with which it is lined. In using the spoon, care must be taken that its sharp edge does not perforate the wall of a vein or other important structure. Any debris which may adhere to the walls is removed by rubbing with dry gauze. The oozing of blood is arrested by packing the cavity for a few minutes with gauze. After the packing is removed, iodoform powder is rubbed into the raw surface. The soft parts divided by the incision are sutured in layers so as to ensure primary union. If, on the other hand, there is fear of a mixed infection, especially in abscesses near the rectum or anus, it is safer to treat it by the open method, packing the cavity with iodoform worsted or bismuth gauze, which is renewed at intervals of a week or ten days as the cavity heals from the bottom.

Another method is to incise the abscess, cleanse the cavity with gauze, irrigate with Carrel-Dakin solution and pack with gauze smeared with the dilute non-toxic B.I.P.P. (bismuth and iodoform 2 parts, vaseline 12 parts, hard paraffin, sufficient to give the consistence of butter). The wound is closed with "bipped" silk sutures; one of these--the "waiting suture"--is left loose to permit of withdrawal of the gauze after forty-eight hours; the waiting suture is then tied, and delayed primary union is thus effected.

When the skin over the abscess is red, thin, and about to give way, as is frequently the case when the abscess is situated in the subcutaneous cellular tissue, any skin which is undermined and infected with tubercle should be removed with the scissors at the same time that the abscess is dealt with.

In abscesses treated by the open method, when the cavity has become lined with healthy granulations, it may be closed by secondary suture, or, if the granulating surface is flush with the skin, healing may be hastened by skin-grafting.

If the tuberculous abscess has burst and left a sinus, this is apt to persist because of the presence of tuberculous tissue in its wall, and of superadded pyogenic infection, or because it serves as an avenue for the escape of discharge from a focus of tubercle in a bone or a lymph gland.

[Illustration: FIG. 35.--Tuberculous Sinus injected through its opening in the forearm with bismuth paste.

(Mr. Pirie Watson's case--Radiogram by Dr. Hope Fowler.)]

The treatment varies with the conditions present, and must include measures directed to the lesion from which the sinus has originated. The extent and direction of any given sinus may be demonstrated by the use of the probe, or, more accurately, by injecting the sinus with a paste consisting of white vaseline containing 10 to 30 per cent. of bismuth subcarbonate, and following its track with the X-rays (Fig. 35).

It was found by Beck of Chicago that the injection of bismuth paste is frequently followed by healing of the sinus, and that, if one injection fails to bring about a cure, repeating the injection every second day may be successful. Some caution must be observed in this treatment, as symptoms of poisoning have been observed to follow its use. If they manifest themselves, an injection of warm olive oil should be given; the oil, left in for twelve hours or so, forms an emulsion with the bismuth, which can be withdrawn by aspiration. Iodoform suspended in glycerin may be employed in a similar manner. When these and other non-operative measures fail, and the whole track of the sinus is accessible, it should be laid open, scraped, and packed with bismuth or iodoform gauze until it heals from the bottom.

The tuberculous ulcer is described in the chapter on ulcers.

CHAPTER IX

SYPHILIS

Definition.--Virus.--ACQUIRED SYPHILIS--Primary period:
_Incubation, primary chancre, glandular enlargement;
_Extra-genital chancres--Treatment--Secondary period: _General symptoms, skin affections, mucous patches, affections of bones, joints, eyes_, etc.--Treatment: _Salvarsan--_Methods of administering mercury--Syphilis and marriage--Intermediate stage--Reminders--Tertiary period: _General symptoms_, _gummata_, _tertiary ulcers_, _tertiary lesions of skin, mucous membrane, bones, joints_, etc.--Second attacks.--INHERITED SYPHILIS--Transmission--Clinical features in infancy, in later life--Contagiousness--Treatment.

Syphilis is an infective disease due to the entrance into the body of a specific virus. It is nearly always communicated from one individual to another by contact infection, the discharge from a syphilitic lesion being the medium through which the virus is transmitted, and the seat of inoculation is almost invariably a surface covered by squamous

epithelium. The disease was unknown in Europe before the year 1493, when it was introduced into Spain by Columbus' crew, who were infected in Haiti, where the disease had been endemic from time immemorial (Bloch).

The granulation tissue which forms as a result of the reaction of the tissues to the presence of the virus is chiefly composed of lymphocytes and plasma cells, along with an abundant new formation of capillary blood vessels. Giant cells are not uncommon, but the endothelioid cells, which are so marked a feature of tuberculous granulation tissue, are practically absent.

When syphilis is communicated from one individual to another by contact infection, the condition is spoken of as acquired syphilis, and the first visible sign of the disease appears at the site of inoculation, and is known as the primary lesion. Those who have thus acquired the disease may transmit it to their offspring, who are then said to suffer from inherited syphilis.

#The Virus of Syphilis.--The cause of syphilis, whether acquired or inherited, is the organism, described by Schaudinn and Hoffman, in 1905, under the name of spirochaeta pallida or spironema pallidum. It is a delicate, thread-like spirilla, in length averaging from 8 to 10 u and in width about 0.25 u, and is distinguished from other spirochaetes by its delicate shape, its dead-white appearance, together with its closely twisted spiral form, with numerous undulations (10 to 26), which are perfectly regular, and are characteristic in that they remain the same during rest and in active movement (Fig. 36). In a fresh specimen, such as a scraping from a hard chancre suspended in a little salt solution, it shows active movements. The organism is readily destroyed by heat, and perishes in the absence of moisture. It has been proved experimentally that it remains infective only up to six hours after its removal from the body. Noguchi has succeeded in obtaining pure cultures from the infected tissues of the rabbit.

[Illustration: FIG. 36.--Spirochaeta pallida from scraping of hard Chancre of Prepuce. x 1000 diam. Burri method.]

The spirochaete may be recognised in films made by scraping the deeper parts of the primary lesion, from papules on the skin, or from blisters artificially raised on lesions of the skin or on the immediately adjacent portion of healthy skin. It is readily found in the mucous patches and condylomata of the secondary period. It is best stained by Giemsa's method, and its recognition is greatly aided by the use of the ultra-microscope.

The spirochaete has been demonstrated in every form of syphilitic lesion, and has been isolated from the blood--with difficulty--and from lymph withdrawn by a hollow needle from enlarged lymph glands. The saliva of persons suffering from syphilitic lesions of the mouth also contains the organism.

[Illustration: FIG. 37.--Spirochaeta refrigerans from scraping of Vagina. x 1000 diam. Burri method.]

In tertiary lesions there is greater difficulty in demonstrating the spirochaete, but small numbers have been found in the peripheral parts of gummatae and in the thickened patches in syphilitic disease of the aorta. Noguchi and Moore have discovered the spirochaete in the brain in a number of cases of general paralysis of the insane. The spirochaete may persist in the body for a long time after infection; its presence has been demonstrated as long as sixteen years after the original acquisition of the disease.

In inherited syphilis the spirochaete is present in enormous numbers throughout all the organs and fluids of the body.

Considerable interest attaches to the observations of Metchnikoff, Roux, and Neisser, who have succeeded in conveying syphilis to the chimpanzee and other members of the ape tribe, obtaining primary and secondary lesions similar to those observed in man, and also containing the

spirochaete. In animals the disease has been transmitted by material from all kinds of syphilitic lesions, including even the blood in the secondary and tertiary stages of the disease. The primary lesion is in the form of an indurated papule, in every respect resembling the corresponding lesion in man, and associated with enlargement and induration of the lymph glands. The primary lesion usually appears about thirty days after inoculation, to be followed, in about half the cases, by secondary manifestations, which are usually of a mild character; in no instance has any tertiary lesion been observed. The severity of the affection amongst apes would appear to be in proportion to the nearness of the relationship of the animal to the human subject. The eye of the rabbit is also susceptible to inoculation from syphilitic lesions; the material in a finely divided state is introduced into the anterior chamber of the eye.

Attempts to immunise against the disease have so far proved negative, but Metchnikoff has shown that the inunction of the part inoculated with an ointment containing 33 per cent. of calomel, within one hour of infection, suffices to neutralise the virus in man, and up to eighteen hours in monkeys. He recommends the adoption of this procedure in the prophylaxis of syphilis.

Noguchi has made an emulsion of dead spirochaetes which he calls luetin, and which gives a specific reaction resembling that of tuberculin in tuberculosis, a papule or a pustule forming at the site of the intra-dermal injection. It is said to be most efficacious in the tertiary and latent forms of syphilis, which are precisely those forms in which the diagnosis is surrounded with difficulties.

ACQUIRED SYPHILIS

In the vast majority of cases, infection takes place during the congress of the sexes. Delicate, easily abraded surfaces are then brought into contact, and the discharge from lesions containing the virus is placed under favourable conditions for conveying the disease from one person to the other. In the male the possibility of infection taking place is increased if the virus is retained under cover of a long and tight prepuce, and if there are abrasions on the surface with which it comes in contact. The frequency with which infection takes place on the genitals during sexual intercourse warrants syphilis being considered a venereal disease, although there are other ways in which it may be contracted.

Some of these imply direct contact--such, for example, as kissing, the digital examination of syphilitic patients by doctors or nurses, or infection of the surgeon's fingers while operating upon a syphilitic patient. In suckling, a syphilitic wet nurse may infect a healthy infant, or a syphilitic infant may infect a healthy wet nurse. In other cases the infection is by indirect contact, the virus being conveyed through the medium of articles contaminated by a syphilitic patient--such, for example, as surgical instruments, tobacco pipes, wind instruments, table utensils, towels, or underclothing. Physiological secretions, such as saliva, milk, or tears, are not capable of communicating the disease unless contaminated by discharge from a syphilitic sore. While the saliva itself is innocuous, it can be, and often is, contaminated by the discharge from mucous patches or other syphilitic lesions in the mouth and throat, and is then a dangerous medium of infection. Unless these extra-genital sources of infection are borne in mind, there is a danger of failing to recognise the primary lesion of syphilis in unusual positions, such as the lip, finger, or nipple. When the disease is thus acquired by innocent transfer, it is known as syphilis insontium.

#Stages or Periods of Syphilis.--Following the teaching of Ricord, it is customary to divide the life-history of syphilis into three periods or stages, referred to, for convenience, as primary, secondary, and tertiary. This division is to some extent arbitrary and artificial, as the different stages overlap one another, and the lesions of one stage merge insensibly into those of another. Wide variations are met with in

the manifestations of the secondary stage, and histologically there is no valid distinction to be drawn between secondary and tertiary lesions.

The primary period embraces the interval that elapses between the initial infection and the first constitutional manifestations,--roughly, from four to eight weeks,--and includes the period of incubation, the development of the primary sore, and the enlargement of the nearest lymph glands.

The secondary period varies in duration from one to two years, during which time the patient is liable to suffer from manifestations which are for the most part superficial in character, affecting the skin and its appendages, the mucous membranes, and the lymph glands.

The tertiary period has no time-limit except that it follows upon the secondary, so that during the remainder of his life the patient is liable to suffer from manifestations which may affect the deeper tissues and internal organs as well as the skin and mucous membranes.

#Primary Syphilis.#--The period of incubation represents the interval that elapses between the occurrence of infection and the appearance of the primary lesion at the site of inoculation. Its limits may be stated as varying from two to six weeks, with an average of from twenty-one to twenty-eight days. While the disease is incubating, there is nothing to show that infection has occurred.

The Primary Lesion.--The incubation period having elapsed, there appears at the site of inoculation a circumscribed area of infiltration which represents the reaction of the tissues to the entrance of the virus. The first appearance is that of a sharply defined papule, rarely larger than a split pea. Its surface is at first smooth and shiny, but as necrosis of the tissue elements takes place in the centre, it becomes concave, and in many cases the epithelium is shed, and an ulcer is formed. Such an ulcer has an elevated border, sharply cut edges, an indurated base, and exudes a scanty serous discharge; its surface is at first occupied by yellow necrosed tissue, but in time this is replaced by smooth, pale-pink granulation tissue; finally, epithelium may spread over the surface, and the ulcer heals. As a rule, the patient suffers little discomfort, and may even be ignorant of the existence of the lesion, unless, as a result of exposure to mechanical or septic irritation, ulceration ensues, and the sore becomes painful and tender, and yields a purulent discharge. The primary lesion may persist until the secondary manifestations make their appearance, that is, for several weeks.

It cannot be emphasised too strongly that the induration of the primary lesion, which has obtained for it the name of "hard chancre," is its most important characteristic. It is best appreciated when the sore is grasped from side to side between the finger and thumb. The sensation on grasping it has been aptly compared to that imparted by a nodule of cartilage, or by a button felt through a layer of cloth. The evidence obtained by touch is more valuable than that obtained by inspection, a fact which is made use of in the recognition of concealed chancres--that is, those which are hidden by a tight prepuce. The induration is due not only to the dense packing of the connective-tissue spaces with lymphocytes and plasma cells, but also to the formation of new connective-tissue elements. It is most marked in chancres situated in the furrow between the glans and the prepuce.

In the male, the primary lesion specially affects certain situations, and the appearances vary with these: (1) On the inner aspect of the prepuce, and in the fold between the prepuce and the glans; in the latter situation the induration imparts a "collar-like" rigidity to the prepuce, which is most apparent when it is rolled back over the corona. (2) At the orifice of the prepuce the primary lesion assumes the form of multiple linear ulcers or fissures, and as each of these is attended with infiltration, the prepuce cannot be pulled back--a condition known as syphilitic phimosis. (3) On the glans penis the infiltration may be so superficial that it resembles a layer of parchment, but if it invades the cavernous tissue there is a dense mass

of induration. (4) On the external aspect of the prepuce or on the skin of the penis itself. (5) At either end of the torn fraenum, in the form of a diamond-shaped ulcer raised above the surroundings. (6) In relation to the meatus and canal of the urethra, in either of which situations the swelling and induration may lead to narrowing of the urethra, so that the urine is passed with pain and difficulty and in a minute stream; stricture results only in the exceptional cases in which the chancre has ulcerated and caused destruction of tissue. A chancre within the orifice of the urethra is rare, and, being concealed from view, it can only be recognised by the discharge from the meatus and by the induration felt between the finger and thumb on palpating the urethra.

In the female, the primary lesion is not so typical or so easily recognised as in men; it is usually met with on the labia; the induration is rarely characteristic and does not last so long. The primary lesion may take the form of condylomata. Indurated oedema, with brownish-red or livid discolouration of one or both labia, is diagnostic of syphilis.

The hard chancre is usually solitary, but sometimes there are two or more; when there are several, they are individually smaller than the solitary chancre.

It is the exception for a hard chancre to leave a visible scar, hence, in examining patients with a doubtful history of syphilis, little reliance can be placed on the presence or absence of a scar on the genitals. When the primary lesion has taken the form of an open ulcer with purulent discharge, or has sloughed, there is a permanent scar.

Infection of the adjacent lymph glands is usually found to have taken place by the time the primary lesion has acquired its characteristic induration. Several of the glands along Poupart's ligament, on one or on both sides, become enlarged, rounded, and indurated; they are usually freely movable, and are rarely sensitive unless there is superadded septic infection. The term bullet-bubo has been applied to them, and their presence is of great value in diagnosis. In a certain number of cases, one of the main lymph vessels on the dorsum of the penis is transformed into a fibrous cord easily recognisable on palpation, and when grasped between the fingers appears to be in size and consistence not unlike the vas deferens.

Concealed chancre is the term applied when one or more chancres are situated within the sac of a prepuce which cannot be retracted. If the induration is well marked, the chancre can be palpated through the prepuce, and is tender on pressure. As under these conditions it is impossible for the patient to keep the parts clean, septic infection becomes a prominent feature, the prepuce is oedematous and inflamed, and there is an abundant discharge of pus from its orifice. It occasionally happens that the infection assumes a virulent character and causes sloughing of the prepuce--a condition known as phagedaena. The discharge is then foul and blood-stained, and the prepuce becomes of a dusky red or purple colour, and may finally slough, exposing the glans.

Extra-genital or Erratic Chancres (Fig. 38).--Erratic chancre is the term applied by Jonathan Hutchinson to the primary lesion of syphilis when it appears on parts of the body other than the genitals. It differs in some respects from the hard chancre as met with on the penis; it is usually larger, the induration is more diffused, and the enlarged glands are softer and more sensitive. The glands in nearest relation to the sore are those first affected, for example, the epitrochlear or axillary glands in chancre of the finger; the submaxillary glands in chancre of the lip or mouth; or the pre-auricular gland in chancre of the eyelid or forehead. In consequence of their divergence from the typical chancre, and of their being often met with in persons who, from age, surroundings, or moral character, are unlikely subjects of venereal disease, the true nature of erratic chancres is often overlooked until the persistence of the lesion, its want of resemblance to anything else, or the onset of constitutional symptoms, determines the diagnosis of syphilis. A solitary, indolent sore occurring on the lip, eyelid, finger, or nipple, which does not heal but tends to increase in size,

and is associated with induration and enlargement of the adjacent glands, is most likely to be the primary lesion of syphilis.

[Illustration: FIG. 38.--Primary Lesion on Thumb, with Secondary Eruption on Forearm.[1]]

[1] From A System of Syphilis, vol. ii., edited by D'Arcy Power and J. Keogh Murphy, Oxford Medical Publications.

#The Soft Sore, Soft Chancre, or Chancroid.--The differential diagnosis of syphilis necessitates the consideration of the soft sore, soft chancre, or chancroid, which is also a common form of venereal disease, and is due to infection with a virulent pus-forming bacillus, first described by Ducrey in 1889. Ducrey's bacillus occurs in the form of minute oval rods measuring about 1.5 u in length, which stain readily with any basic aniline dye, but are quickly decolorised by Gram's method. They are found mixed with other organisms in the purulent discharge from the sore, and are chiefly arranged in small groups or in short chains. Soft sores are always contracted by direct contact from another individual, and the incubation period is a short one of from two to five days. They are usually situated in the vicinity of the fraenum, and, in women, about the labia minora or fourchette; they probably originate in abrasions in these situations. They appear as pustules, which are rapidly converted into small, acutely inflamed ulcers with sharply cut, irregular margins, which bleed easily and yield an abundant yellow purulent discharge. They are devoid of the induration of syphilis, are painful, and nearly always multiple, reproducing themselves in successive crops by auto-inoculation. Soft sores are often complicated by phimosis and balanitis, and they frequently lead to infection of the glands in the groin. The resulting bubo is ill-defined, painful, and tender, and suppuration occurs in about one-fourth of the cases. The overlying skin becomes adherent and red, and suppuration takes place either in the form of separate foci in the interior of the individual glands, or around them; in the latter case, on incision, the glands are found lying bathed in pus. Ducrey's bacillus is found in pure culture in the pus. Sometimes other pyogenic organisms are superadded. After the bubo has been opened the wound may take on the characters of a soft sore.

Treatment.--Soft sores heal rapidly when kept clean. If concealed under a tight prepuce, an incision should be made along the dorsum to give access to the sores. They should be washed with eusol, and dusted with a mixture of one part iodoform and two parts boracic or salicylic acid, or, when the odour of iodoform is objected to, of equal parts of boracic acid and carbonate of zinc. Immersion of the penis in a bath of eusol for some hours daily is useful. The sore is then covered with a piece of gauze kept in position by drawing the prepuce over it, or by a few turns of a narrow bandage. Sublimed sulphur frequently rubbed into the sore is recommended by C. H. Mills. If the sores spread in spite of this, they should be painted with cocaine and then cauterised. When the glands in the groin are infected, the patient must be confined to bed, and a dressing impregnated with ichthylol and glycerin (10 per cent.) applied; the repeated use of a suction bell is of great service. Harrison recommends aspiration of a bubonic abscess, followed by injection of 1 in 20 solution of tincture of iodine into the cavity; this is in turn aspirated, and then 1 or 2 c.c. of the solution injected and left in. This is repeated as often as the cavity refills. It is sometimes necessary to let the pus out by one or more small incisions and continue the use of the suction bell.

Diagnosis of Primary Syphilis.--In cases in which there is a history of an incubation period of from three to five weeks, when the sore is indurated, persistent, and indolent, and attended with bullet-buboes in the groin, the diagnosis of primary syphilis is not difficult. Owing, however, to the great importance of instituting treatment at the earliest possible stage of the infection, an effort should be made to establish the diagnosis without delay by demonstrating the spirochaete. Before any antiseptic is applied, the margin of the suspected sore is rubbed with gauze, and the serum that exudes on pressure is collected in a capillary tube and sent to a pathologist for microscopical

examination. A better specimen can sometimes be obtained by puncturing an enlarged lymph gland with a hypodermic needle, injecting a few minims of sterile saline solution and then aspirating the blood-stained fluid.

The Wassermann test must not be relied upon for diagnosis in the early stage, as it does not appear until the disease has become generalised and the secondary manifestations are about to begin. The practice of waiting in doubtful cases before making a diagnosis until secondary manifestations appear is to be condemned.

Extra-genital chancres, e.g. sores on the fingers of doctors or nurses, are specially liable to be overlooked, if the possibility of syphilis is not kept in mind.

It is important to bear in mind the possibility of a patient having acquired a mixed infection with the virus of soft chancre, which will manifest itself a few days after infection, and the virus of syphilis, which shows itself after an interval of several weeks. This occurrence was formerly the source of much confusion in diagnosis, and it was believed at one time that syphilis might result from soft sores, but it is now established that syphilis does not follow upon soft sores unless the virus of syphilis has been introduced at the same time. The practitioner must be on his guard, therefore, when a patient asks his advice concerning a venereal sore which has appeared within a few days of exposure to infection. Such a patient is naturally anxious to know whether he has contracted syphilis or not, but neither a positive nor a negative answer can be given--unless the spirochaete can be identified.

Syphilis is also to be diagnosed from epithelioma, the common form of cancer of the penis. It is especially in elderly patients with a tight prepuce that the induration of syphilis is liable to be mistaken for that associated with epithelioma. In difficult cases the prepuce must be slit open.

Difficulty may occur in the diagnosis of primary syphilis from herpes, as this may appear as late as ten days after connection; it commences as a group of vesicles which soon burst and leave shallow ulcers with a yellow floor; these disappear quickly on the use of an antiseptic dusting powder.

Apprehensive patients who have committed sexual indiscretions are apt to regard as syphilitic any lesion which happens to be located on the penis--for example, acne pustules, eczema, psoriasis papules, boils, balanitis, or venereal warts.

The local treatment of the primary sore consists in attempting to destroy the organisms in situ. An ointment made up of calomel 33 parts, lanoline 67 parts, and vaseline 10 parts (Metchnikoff's cream) is rubbed into the sore several times a day. If the surface is unbroken, it may be dusted lightly with a powder composed of equal parts of calomel and carbonate of zinc. A gauze dressing is applied, and the penis and scrotum should be supported against the abdominal wall by a triangular handkerchief or bathing-drawers; if there is inflammatory oedema the patient should be confined to bed.

In concealed chancres with phimosis, the sac of the prepuce should be slit up along the dorsum to admit of the ointment being applied. If phagedaena occurs, the prepuce must be slit open along the dorsum, or if sloughing, cut away, and the patient should have frequent sitz baths of weak sublimate lotion. When the chancre is within the meatus, iodoform bougies are inserted into the urethra, and the urine should be rendered bland by drinking large quantities of fluid.

General treatment is considered on p. 149.

#Secondary Syphilis.#--The following description of secondary syphilis is based on the average course of the disease in untreated cases. The onset of constitutional symptoms occurs from six to twelve weeks after infection, and the manifestations are the result of the entrance of the virus into the general circulation, and its being carried to all parts

of the body. The period during which the patient is liable to suffer from secondary symptoms ranges from six months to two years.

In some cases the general health is not disturbed; in others the patient is feverish and out of sorts, losing appetite, becoming pale and anaemic, complaining of lassitude, incapacity for exertion, headache, and pains of a rheumatic type referred to the bones. There is a moderate degree of leucocytosis, but the increase is due not to the polymorpho-nuclear leucocytes but to lymphocytes. In isolated cases the temperature rises to 101° or 102° F. and the patient loses flesh. The lymph glands, particularly those along the posterior border of the sterno-mastoid, become enlarged and slightly tender. The hair comes out, eruptions appear on the skin and mucous membranes, and the patient may suffer from sore throat and affections of the eyes. The local lesions are to be regarded as being of the nature of reactions against accumulations of the parasite, lymphocytes and plasma cells being the elements chiefly concerned in the reactive process.

Affections of the Skin are among the most constant manifestations. An evanescent macular rash, not unlike that of measles--roseola--is the first to appear, usually in from six to eight weeks from the date of infection; it is widely diffused over the trunk, and the original dull rose-colour soon fades, leaving brownish stains, which in time disappear. It is usually followed by a papular eruption, the individual papules being raised above the surface of the skin, smooth or scaly, and as they are due to infiltration of the skin they are more persistent than the roseoles. They vary in size and distribution, being sometimes small, hard, polished, and closely aggregated like lichen, sometimes as large as a shilling-piece, with an accumulation of scales on the surface like that seen in psoriasis. The co-existence of scaly papules and faded roseoles is very suggestive of syphilis.

Other types of eruption are less common, and are met with from the third month onwards. A pustular eruption, not unlike that of acne, is sometimes a prominent feature, but is not characteristic of syphilis unless it affects the scalp and forehead and is associated with the remains of the papular eruption. The term ecthyma is applied when the pustules are of large size, and, after breaking on the surface, give rise to superficial ulcers; the discharge from the ulcer often dries up and forms a scab or crust which is continually added to from below as the ulcer extends in area and depth. The term rupia is applied when the crusts are prominent, dark in colour, and conical in shape, roughly resembling the shell of a limpet. If the crust is detached, a sharply defined ulcer is exposed, and when this heals it leaves a scar which is usually circular, thin, white, shining like satin, and the surrounding skin is darkly pigmented; in the case of deep ulcers, the scar is depressed and adherent (Fig. 39).

[Illustration: FIG. 39.--Syphilitic Rupia, showing the limpet-shaped crusts or scabs.]

In the later stages there may occur a form of creeping or spreading ulceration of the skin of the face, groin, or scrotum, healing at one edge and spreading at another like tuberculous lupus, but distinguished from this by its more rapid progress and by the pigmentation of the scar.

Condylomata are more characteristic of syphilis than any other type of skin lesion. They are papules occurring on those parts of the body where the skin is habitually moist, and especially where two skin surfaces are in contact. They are chiefly met with on the external genitals, especially in women, around the anus, beneath large pendulous mammae, between the toes, and at the angles of the mouth, and in these situations their development is greatly favoured by neglect of cleanliness. They present the appearance of well-defined circular or ovoid areas in which the skin is thickened and raised above the surface; they are covered with a white sodden epidermis, and furnish a scanty but very infective discharge. Under the influence of irritation and want of rest, as at the anus or at the angle of the mouth, they are apt to become fissured and superficially ulcerated, and the discharge then

becomes abundant and may crust on the surface, forming yellow scabs. At the angle of the mouth the condylomatous patches may spread to the cheek, and when they ulcerate may leave fissure-like scars radiating from the mouth--an appearance best seen in inherited syphilis (Fig. 44).

The Appendages of the Skin.--The hair loses its gloss, becomes dry and brittle, and readily falls out, either as an exaggeration of the normal shedding of the hair, or in scattered areas over the scalp (syphilitic alopecia). The hair is not re-formed in the scars which result from ulcerated lesions of the scalp. The nail-folds occasionally present a pustular eruption and superficial ulceration, to which the name syphilitic onychia has been applied; more commonly the nails become brittle and ragged, and they may even be shed.

The Mucous Membranes, and especially those of the mouth and throat, suffer from lesions similar to those met with on the skin. On a mucous surface the papular eruption assumes the form of mucous patches, which are areas with a congested base covered with a thin white film of sodden epithelium like wet tissue-paper. They are best seen on the inner aspect of the cheeks, the soft palate, uvula, pillars of the fauces, and tonsils. In addition to mucous patches, there may be a number of small, superficial, kidney-shaped ulcers, especially along the margins of the tongue and on the tonsils. In the absence of mucous patches and ulcers, the sore throat may be characterised by a bluish tinge of the inflamed mucous membrane and a thin film of shed epithelium on the surface. Sometimes there is an elongated sinuous film which has been likened to the track of a snail. In the larynx the presence of congestion, oedema, and mucous patches may be the cause of persistent hoarseness. The tongue often presents a combination of lesions, including ulcers, patches where the papillae are absent, fissures, and raised white papules resembling warts, especially towards the centre of the dorsum. These lesions are specially apt to occur in those who smoke, drink undiluted alcohol or spirits, or eat hot condiments to excess, or who have irregular, sharp-cornered teeth. At a later period, and in those who are broken down in health from intemperance or other cause, the sore throat may take the form of rapidly spreading, penetrating ulcers in the soft palate and pillars of the fauces, which may lead to extensive destruction of tissue, with subsequent scars and deformity highly characteristic of previous syphilis.

In the Bones, lesions occur which assume the clinical features of an evanescent periostitis, the patient complaining of nocturnal pains over the frontal bone, sternum, tibiae, and ulnae, and localised tenderness on tapping over these bones.

In the Joints, a serous synovitis or hydrops may occur, chiefly in the knee, on one or on both sides.

The Affections of the Eyes, although fortunately rare, are of great importance because of the serious results which may follow if they are not recognised and treated. Iritis is the commonest of these, and may occur in one or in both eyes, one after the other, from three to eight months after infection. The patient complains of impairment of sight and of frontal or supraorbital pain. The eye waters and is hypersensitive, the iris is discoloured and reacts sluggishly to light, and there is a zone of ciliary congestion around the cornea. The appearance of minute white nodules or flakes of lymph at the margin of the pupil is especially characteristic of syphilitic iritis. When adhesions have formed between the iris and the structures in relation to it, the pupil dilates irregularly under atropin. Although complete recovery is to be expected under early and energetic treatment, if neglected, iritis may result in occlusion of the pupil and permanent impairment or loss of sight.

The other lesions of the eye are much rarer, and can only be discovered on ophthalmoscopic examination.

The virus of syphilis exerts a special influence upon the Blood Vessels, exciting a proliferation of the endothelial lining which results in narrowing of their lumen, endarteritis, and a perivascular

infiltration in the form of accumulations of plasma cells around the vessels and in the lymphatics that accompany them.

In the Brain, in the later periods of secondary and in tertiary syphilis, changes occur as a result of the narrowing of the lumen of the arteries, or of their complete obliteration by thrombosis. By interfering with the nutrition of those parts of the brain supplied by the affected arteries, these lesions give rise to clinical features of which severe headache and paralysis are the most prominent.

Affections of the Spinal Cord are extremely rare, but paraplegia from myelitis has been observed.

Lastly, attention must be directed to the remarkable variations observed in different patients. Sometimes the virulent character of the disease can only be accounted for by an idiosyncrasy of the patient.

Constitutional symptoms, particularly pyrexia and anaemia, are most often met with in young women. Patients over forty years of age have greater difficulty in overcoming the infection than younger adults. Malarial and other infections, and the conditions attending life in tropical countries, from the debility which they cause, tend to aggravate and prolong the disease, which then assumes the characters of what has been called malignant syphilis. All chronic ailments have a similar influence, and alcoholic intemperance is universally regarded as a serious aggravating factor.

Diagnosis of Secondary Syphilis.--A routine examination should be made of the parts of the body which are most often affected in this disease--the scalp, mouth, throat, posterior cervical glands, and the trunk, the patient being stripped and examined by daylight. Among the diagnostic features of the skin affections the following may be mentioned: They are frequently, and sometimes to a marked degree, symmetrical; more than one type of eruption--papules and pustules, for example--are present at the same time; there is little itching; they are at first a dull-red colour, but later present a brown pigmentation which has been likened to the colour of raw ham; they exhibit a predilection for those parts of the forehead and neck which are close to the roots of the hair; they tend to pass off spontaneously; and they disappear rapidly under treatment.

#Serum Diagnosis--Wassermann Reaction.#--Wassermann found that if an extract of syphilitic liver rich in spirochaetes is mixed with the serum from a syphilitic patient, a large amount of complement is fixed. The application of the test is highly complicated and can only be carried out by an expert pathologist. For the purpose he is supplied with from 5 c.c. to 10 c.c. of the patient's blood, withdrawn under aseptic conditions from the median basilic vein by means of a serum syringe, and transferred to a clean and dry glass tube. There is abundant evidence that the Wassermann test is a reliable means of establishing a diagnosis of syphilis.

A definitely positive reaction can usually be obtained between the fifteenth and thirtieth day after the appearance of the primary lesion, and as time goes on it becomes more marked. During the secondary period the reaction is practically always positive. In the tertiary stage also it is positive except in so far as it is modified by the results of treatment. In para-syphilitic lesions such as general paralysis and tabes a positive reaction is almost always present. In inherited syphilis the reaction is positive in every case. A positive reaction may be present in other diseases, for example, frambesia, trypanosomiasis, and leprosy.

As the presence of the reaction is an evidence of the activity of the spirochaetes, repeated applications of the test furnish a valuable means of estimating the efficacy of treatment. The object aimed at is to change a persistently positive reaction to a permanently negative one.

#Treatment of Syphilis.#--In the treatment of syphilis the two main objects are to maintain the general health at the highest possible standard, and to introduce into the system therapeutic agents which will

inhibit or destroy the invading parasite.

The second of these objects has been achieved by the researches of Ehrlich, who, in conjunction with his pupil, Hata, has built up a compound, the dihydrochloride of dioxydiamido-arseno-benzol, popularly known as salvarsan or "606." Other preparations, such as kharsivan, arseno-billon, and diarsenol, are chemically equivalent to salvarsan, containing from 27 to 31 per cent. of arsenic, and are equally efficient. The full dose is 0.6 grm. All these members of the "606" group form an acid solution when dissolved in water, and must be rendered alkaline before being injected. As subcutaneous and intra-muscular injections cause considerable pain, and may cause sloughing of the tissues, "606" preparations must be injected intravenously. Ehrlich has devised a preparation--neo-salvarsan, or "914," which is more easily prepared and forms a neutral solution. It contains from 18 to 20 per cent. of arsenic. Neo-kharsivan, novo-arseno-billon, and neo-diarsenol belong to the "914" group, the full dosage of which is 0.9 grm. As subcutaneous and intra-muscular injections of the "914" group are not painful, and even more efficient than intravenous injections, the administration is simpler.

Ganyl, luargol, and other preparations act in the same way as the "606" and "914" groups.

The "606" preparations may be introduced into the veins by injection or by means of an apparatus which allows the solution to flow in by gravity. The left median basilic vein is selected, and a platino-iridium needle with a short point and a bore larger than that of the ordinary hypodermic syringe is used. The needle is passed for a few millimetres along the vein, and the solution is then slowly introduced; before withdrawing the needle some saline is run in to diminish the risk of thrombosis.

The "914" preparations may be injected either into the subcutaneous tissue of the buttock or into the substance of the gluteus muscle. The part is then massaged for a few minutes, and the massage is repeated daily for a few days.

No hard-and-fast rules can be laid down as to what constitutes a complete course of treatment. Harrison recommends as a minimum course of one of the "914" preparations in early primary cases an initial dose of 0.45 grm. given intra-muscularly or into the deep subcutaneous tissue; the same dose a week later; 0.6 grm. the following week; then miss a week and give 0.6 grms. on two successive weeks; then miss two weeks and give 0.6 grm. on two more successive weeks.

When a positive Wassermann reaction is present before treatment is commenced, the above course is prolonged as follows: for three weeks is given a course of potassium iodide, after which four more weekly injections of 0.6 grm. of "914" are given.

With each injection of "914" after the first, throughout the whole course 1 grain of mercury is injected intra-muscularly.

In the course of a few hours, there is usually some indisposition, with a feeling of chilliness and slight rise of temperature; these symptoms pass off within twenty-four hours, and in a few days there is a decided improvement of health. Three or four days after an intra-muscular injection there may be pain and stiffness in the gluteal region.

These preparations are the most efficient therapeutic agents that have yet been employed in the treatment of syphilis.

The manifestations of the disease disappear with remarkable rapidity. Observations show that the spirochaetes lose their capacity for movement within an hour or two of the administration, and usually disappear altogether in from twenty-four to thirty-six hours. Wassermann's reaction usually yields a negative result in from three weeks to two months, but later may again become positive. Subsequent doses of the arsenical preparation are therefore usually indicated, and should be

given in from 7 to 21 days according to the dose.

When syphilis occurs in a pregnant woman, she should be given in the early months an ordinary course of "914," followed by 10-grain doses of potassium iodide twice daily. The injections may be repeated two months later, and during the remainder of the pregnancy 2-grain mercury pills are given twice daily (A. Campbell). The presence of albumen in the urine contra-indicates arsenical treatment.

It need scarcely be pointed out that the use of powerful drugs like "606" and "914" is not free from risk; it may be mentioned that each dose contains nearly three grains of arsenic. Before the administration the patient must be overhauled; its administration is contra-indicated in the presence of disease of the heart and blood vessels, especially a combination of syphilitic aortitis and sclerosis of the coronary arteries, with degeneration of the heart muscle; in affections of the central nervous system, especially advanced paralysis, and in such disturbances of metabolism as are associated with diabetes and Bright's disease. Its use is not contra-indicated in any lesion of active syphilis.

The administration is controlled by the systematic examination of the urine for arsenic.

The Administration of Mercury.--The success of the arsenical preparations has diminished the importance of mercury in the treatment of syphilis, but it is still used to supplement the effect of the injections. The amount of mercury to be given in any case must be proportioned to the idiosyncrasies of the patient, and it is advisable, before commencing the treatment, to test his urine and record his body-weight. The small amount of mercury given at the outset is gradually increased. If the body-weight falls, or if the gums become sore and the breath foul, the mercury should be stopped for a time. If salivation occurs, the drinking of hot water and the taking of hot baths should be insisted upon, and half-dram doses of the alkaline sulphates prescribed.

Methods of Administering Mercury.--(1) By the Mouth.--This was for long the most popular method in this country, the preparation usually employed being grey powder, in pills or tablets, each of which contains one grain of the powder. Three of these are given daily in the first instance, and the daily dose is increased to five or even seven grains till the standard for the individual patient is arrived at. As the grey powder alone sometimes causes irritation of the bowels, it should be combined with iron, as in the following formula: Hydrarg. c. cret. gr. 1; ferri sulph. exsiccat. gr. 1 or 2.

(2) By Inunction.--Inunction consists in rubbing into the pores of the skin an ointment composed of equal parts of 20 per cent. oleate of mercury and lanolin. Every night after a hot bath, a dram of the ointment (made up by the chemist in paper packets) is rubbed for fifteen minutes into the skin where it is soft and comparatively free from hairs. When the patient has been brought under the influence of the mercury, inunction may be replaced by one of the other methods, of administering the drug.

(3) By Intra-muscular Injection.--This consists in introducing the drug by means of a hypodermic syringe into the substance of the gluteal muscles. The syringe is made of glass, and has a solid glass piston; the needle of platino-iridium should be 5 cm. long and of a larger calibre than the ordinary hypodermic needle. The preparation usually employed consists of: metallic mercury or calomel 1 dram, lanolin and olive oil each 2 drams; it must be warmed to allow of its passage through the needle. Five minims--containing one grain of metallic mercury--represent a dose, and this is injected into the muscles above and behind the great trochanter once a week. The contents of the syringe are slowly expressed, and, after withdrawing the needle, gentle massage of the buttock should be employed. Four courses each of ten injections are given the first year, three courses of the same number during the second and third years, and two courses during the fourth year (Lambkin).

The General Health.--The patient must lead a regular life and cultivate the fresh-air habit, which is as beneficial in syphilis as in tuberculosis. Anaemia, malaria, and other sources of debility must receive appropriate treatment. The diet should be simple and easily digested, and should include a full supply of milk. Alcohol is prohibited. The excretory organs are encouraged to act by the liberal drinking of hot water between meals, say five or six tumblerfuls in the twenty-four hours. The functions of the skin are further aided by frequent hot baths, and by the wearing of warm underclothing. While the patient should avoid exposure to cold, and taxing his energies by undue exertion, he should be advised to take exercise in the open air. On account of the liability to lesions of the mouth and throat, he should use tobacco in moderation, his teeth should be thoroughly overhauled by the dentist, and he should brush them after every meal, using an antiseptic tooth powder or wash. The mouth and throat should be rinsed out night and morning with a solution of chlorate of potash and alum, or with peroxide of hydrogen.

Treatment of the Local Manifestations.--The skin lesions are treated on the same lines as similar eruptions of other origin. As local applications, preparations of mercury are usually selected, notably the ointments of the red oxide of mercury, ammoniated mercury, or oleate of mercury (5 per cent.), or the mercurial plaster introduced by Uhna. In the treatment of condylomata the greatest attention must be paid to cleanliness and dryness. After washing and drying the affected patches, they are dusted with a powder consisting of equal parts of calomel and carbonate of zinc; and apposed skin surfaces, such as the nates or labia, are separated by sublimate wool. In the ulcers of later secondary syphilis, crusts are got rid of in the first instance by means of a boracic poultice, after which a piece of lint or gauze cut to the size of the ulcer and soaked in black wash is applied and covered with oil-silk. If the ulcer tends to spread in area or in depth, it should be scraped with a sharp spoon, and painted over with acid nitrate of mercury, or a local hyperaemia may be induced by Klapp's suction apparatus.

In lesions of the mouth and throat, the teeth should be attended to; the best local application is a solution of chromic acid--10 grains to the ounce--painted on with a brush once daily. If this fails, the lesions may be dusted with calomel the last thing at night. For deep ulcers of the throat the patient should gargle frequently with chlorine water or with perchloride of mercury (1 in 2000); if the ulcer continues to spread it should be painted with acid nitrate of mercury.

In the treatment of iritis the eyes are shaded from the light and completely rested, and the pupil is well dilated by atropin to prevent adhesions. If there is much pain, a blister may be applied to the temple.

The Relations of Syphilis to Marriage.--Before the introduction of the Ehrlich-Hata treatment no patient was allowed to marry until three years had elapsed after the disappearance of the last manifestation. While marriage might be entered upon under these conditions without risk of the husband infecting the wife, the possibility of his conveying the disease to the offspring cannot be absolutely excluded. It is recommended, as a precautionary measure, to give a further mercurial course of two or three months' duration before marriage, and an intravenous injection of an arsenical preparation.

#Intermediate Stage.#--After the dying away of the secondary manifestations and before the appearance of tertiary lesions, the patient may present certain symptoms which Hutchinson called reminders. These usually consist of relapses of certain of the affections of the skin, mouth, or throat, already described. In the skin, they may assume the form of peeling patches in the palms, or may appear as spreading and confluent circles of a scaly papular eruption, which if neglected may lead to the formation of fissures and superficial ulcers. Less frequently there is a relapse of the eye affections, or of paralytic symptoms from disease of the cerebral arteries.

#Tertiary Syphilis.--While the manifestations of primary and secondary syphilis are common, those of the tertiary period are by comparison rare, and are observed chiefly in those who have either neglected treatment or who have had their powers of resistance lowered by privation, by alcoholic indulgence, or by tropical disease.

It is to be borne in mind that in a certain proportion of men and in a larger proportion of women, the patient has no knowledge of having suffered from syphilis. Certain slight but important signs may give the clue in a number of cases, such as irregularity of the pupils or failure to react to light, abnormality of the reflexes, and the discovery of patches of leucoplakia on the tongue, cheek, or palate.

The general character of tertiary manifestations may be stated as follows: They attack by preference the tissues derived from the mesoblastic layer of the embryo--the cellular tissue, bones, muscles, and viscera. They are often localised to one particular tissue or organ, such, for example, as the subcutaneous cellular tissue, the bones, or the liver, and they are rarely symmetrical. They are usually aggressive and persistent, with little tendency to natural cure, and they may be dangerous to life, because of the destructive changes produced in such organs as the brain or the larynx. They are remarkably amenable to treatment if instituted before the stage which is attended with destruction of tissue is reached. Early tertiary lesions may be infective, and the disease may be transmitted by the discharges from them; but the later the lesions the less is the risk of their containing an infective virus.

The most prominent feature of tertiary syphilis consists in the formation of granulation tissue, and this takes place on a scale considerably larger than that observed in lesions of the secondary period. The granulation tissue frequently forms a definite swelling or tumour-like mass (syphilitoma), which, from its peculiar elastic consistence, is known as a gumma. In its early stages a gumma is a firm, semi-translucent greyish or greyish-red mass of tissue; later it becomes opaque, yellow, and caseous, with a tendency to soften and liquefy. The gumma does harm by displacing and replacing the normal tissue elements of the part affected, and by involving these in the degenerative changes, of the nature of caseation and necrosis, which produce the destructive lesions of the skin, mucous membranes, and internal organs. This is true not only of the circumscribed gumma, but of the condition known as gummatoous infiltration or syphilitic cirrhosis, in which the granulation tissue is diffused throughout the connective-tissue framework of such organs as the tongue or liver. Both the gummatoous lesions and the fibrosis of tertiary syphilis are directly excited by the spirochaetes.

The life-history of an untreated gumma varies with its environment. When protected from injury and irritation in the substance of an internal organ such as the liver, it may become encapsulated by fibrous tissue, and persist in this condition for an indefinite period, or it may be absorbed and leave in its place a fibrous cicatrix. In the interior of a long bone it may replace the rigid framework of the shaft to such an extent as to lead to pathological fracture. If it is near the surface of the body--as, for example, in the subcutaneous or submucous cellular tissue, or in the periosteum of a superficial bone, such as the palate, the skull, or the tibia--the tissue of which it is composed is apt to undergo necrosis, in which the overlying skin or mucous membrane frequently participates, the result being an ulcer--the tertiary syphilitic ulcer (Figs. 40 and 41).

Tertiary Lesions of the Skin and Subcutaneous Cellular Tissue.--The clinical features of a subcutaneous gumma are those of an indolent, painless, elastic swelling, varying in size from a pea to an almond or walnut. After a variable period it usually softens in the centre, the skin over it becomes livid and dusky, and finally separates as a slough, exposing the tissue of the gumma, which sometimes appears as a mucoid, yellowish, honey-like substance, more frequently as a sodden, caseated tissue resembling wash-leather. The caseated tissue of a gumma differs

from that of a tuberculous lesion in being tough and firm, of a buff colour like wash-leather, or whitish, like boiled fish. The degenerated tissue separates slowly and gradually, and in untreated cases may be visible for weeks in the floor of the ulcer.

[Illustration: FIG. 40.--Ulcerating Gumma of Lips.]

(From a photograph lent by Dr. Stopford Taylor and Dr. R. W. Mackenna.)]

The tertiary ulcer may be situated anywhere, but is most frequently met with on the leg, especially in the region of the knee (Fig. 42) and over the calf. There may be one or more ulcers, and also scars of antecedent ulcers. The edges are sharply cut, as if punched out; the margins are rounded in outline, firm, and congested; the base is occupied by gummatous tissue, or, if this has already separated and sloughed out, by unhealthy granulations and a thick purulent discharge. When the ulcer has healed it leaves a scar which is depressed, and if over a bone, is adherent to it. The features of the tertiary ulcer, however, are not always so characteristic as the above description would imply. It is to be diagnosed from the "leg ulcer," which occurs almost exclusively on the lower third of the leg; from Bazin's disease (p. 74); from the ulcers that result from certain forms of malignant disease, such as rodent cancer, and from those met with in chronic glanders.

Gummatous Infiltration of the Skin ("Syphilitic Lupus").--This is a lesion, met with chiefly on the face and in the region of the external genitals, in which the skin becomes infiltrated with granulation tissue so that it is thickened, raised above the surface, and of a brownish-red colour. It appears as isolated nodules, which may fuse together; the epidermis becomes scaly and is shed, giving rise to superficial ulcers which are usually covered by crusted discharge. The disease tends to spread, creeping over the skin with a serpiginous, crescentic, or horse-shoe margin, while the central portion may heal and leave a scar. From the fact of its healing in the centre while it spreads at the margin, it may resemble tuberculous disease of the skin. It can usually be differentiated by observing that the infiltration is on a larger scale; the progress is much more rapid, involving in the course of months an area which in the case of tuberculosis would require as many years; the scars are sounder and are less liable to break down again; and the disease rapidly yields to anti-syphilitic treatment.

[Illustration: FIG. 41.--Ulceration of nineteen year's duration in a woman aet. 24, the subject of inherited syphilis, showing active ulceration, cicatricial contraction, and sabre-blade deformity of tibiae.]

Tertiary lesions of mucous membrane and of the submucous cellular tissue are met with chiefly in the tongue, nose, throat, larynx, and rectum. They originate as gummata or as gummatous infiltrations, which are liable to break down and lead to the formation of ulcers which may prove locally destructive, and, in such situations as the larynx, even dangerous to life. In the tongue the tertiary ulcer may prove the starting-point of cancer; and in the larynx or rectum the healing of the ulcer may lead to cicatricial stenosis.

Tertiary lesions of the bones and joints, of the muscles, and of the internal organs, will be described under these heads. The part played by syphilis in the production of disease of arteries and of aneurysm will be referred to along with diseases of blood vessels.

[Illustration: FIG. 42.--Tertiary Syphilitic Ulceration in region of Knee and on both Thumbs of woman aet. 37.]

Treatment.--The most valuable drugs for the treatment of the manifestations of the tertiary period are the arsenical preparations and the iodides of sodium and potassium. On account of their depressing effects, the latter are frequently prescribed along with carbonate of ammonium. The dose is usually a matter of experiment in each individual case; 5 grains three times a day may suffice, or it may be necessary to increase each dose to 20 or 25 grains. The symptoms of iodism which may

follow from the smaller doses usually disappear on giving a larger amount of the drug. It should be taken after meals, with abundant water or other fluid, especially if given in tablet form. It is advisable to continue the iodides for from one to three months after the lesions for which they are given have cleared up. If the potassium salt is not tolerated, it may be replaced by the ammonium or sodium iodide.

Local Treatment.--The absorption of a subcutaneous gumma is often hastened by the application of a fly-blister. When a gumma has broken on the surface and caused an ulcer, this is treated on general principles, with a preference, however, for applications containing mercury or iodine, or both. If a wet dressing is required to cleanse the ulcer, black wash may be used; if a powder to promote dryness, one containing iodoform; if an ointment is indicated, the choice lies between the red oxide of mercury or the dilute nitrate of mercury ointment, and one consisting of equal parts of lanolin and vaselin with 2 per cent. of iodine. Deep ulcers, and obstinate lesions of the bones, larynx, and other parts may be treated by excision or scraping with the sharp spoon.

#Second Attacks of Syphilis.#--Instances of re-infection of syphilis have been recorded with greater frequency since the more general introduction of arsenical treatment. A remarkable feature in such cases is the shortness of the interval between the original infection and the alleged re-infection; in a recent series of twenty-eight cases, this interval was less than a year. Another feature of interest is that when patients in the tertiary stage of syphilis are inoculated with the virus from lesions from these in the primary and secondary stage lesions of the tertiary type are produced.

Reference may be made to the #relapsing false indurated chancre#, described by Hutchinson and by Fournier, as it may be the source of difficulty in diagnosis. A patient who has had an infecting chancre one or more years before, may present a slightly raised induration on the penis at or close to the site of his original sore. This relapsed induration is often so like that of a primary chancre that it is impossible to distinguish between them, except by the history. If there has been a recent exposure to venereal infection, it is liable to be regarded as the primary lesion of a second attack of syphilis, but the further progress shows that neither bullet-buboës nor secondary manifestations develop. These facts, together with the disappearance of the induration under treatment, make it very likely that the lesion is really gummatous in character.

INHERITED SYPHILIS

One of the most striking features of syphilis is that it may be transmitted from infected parents to their offspring, the children exhibiting the manifestations that characterise the acquired form of the disease.

The more recent the syphilis in the parent, the greater is the risk of the disease being communicated to the offspring; so that if either parent suffers from secondary syphilis the infection is almost inevitably transmitted.

While it is certain that either parent may be responsible for transmitting the disease to the next generation, the method of transmission is not known. In the case of a syphilitic mother it is most probable that the infection is conveyed to the foetus by the placental circulation. In the case of a syphilitic father, it is commonly believed that the infection is conveyed to the ovum through the seminal fluid at the moment of conception. If a series of children, one after the other, suffer from inherited syphilis, it is almost invariably the case that the mother has been infected.

In contrast to the acquired form, inherited syphilis is remarkable for the absence of any primary stage, the infection being a general one from the outset. The spirochaete is demonstrated in incredible numbers in the liver, spleen, lung, and other organs, and in the nasal secretion, and,

from any of these, successful inoculations in monkeys can readily be made. The manifestations differ in degree rather than in kind from those of the acquired disease; the difference is partly due to the fact that the virus is attacking developing instead of fully formed tissues.

The virus exercises an injurious influence on the foetus, which in many cases dies during the early months of intra-uterine life, so that miscarriage results, and this may take place in repeated pregnancies, the date at which the miscarriage occurs becoming later as the virus in the mother becomes attenuated. Eventually a child is carried to full term, and it may be still-born, or, if born alive, may suffer from syphilitic manifestations. It is difficult to explain such vagaries of syphilitic inheritance as the infection of one twin and the escape of the other.

Clinical Features.--We are not here concerned with the severe forms of the disease which prove fatal, but with the milder forms in which the infant is apparently healthy when born, but after from two to six weeks begins to show evidence of the syphilitic taint.

The usual phenomena are that the child ceases to thrive, becomes thin and sallow, and suffers from eruptions on the skin and mucous membranes. There is frequently a condition known as snuffles, in which the nasal passages are obstructed by an accumulation of thin muco-purulent discharge which causes the breathing to be noisy. It usually begins within a month after birth and before the eruptions on the skin appear. When long continued it is liable to interfere with the development of the nasal bones, so that when the child grows up there results a condition known as the "saddle-nose" deformity (Figs. 43 and 44).

[Illustration: FIG. 43.--Facies of Inherited Syphilis.]

(From Dr. Byrom Bramwell's Atlas of Clinical Medicine.)]

Affections of the Skin.--Although all types of skin affection are met with in the inherited disease, the most important is a papular eruption, the papules being of large size, with a smooth shining top and of a reddish-brown colour. It affects chiefly the buttocks and thighs, the genitals, and other parts which are constantly moist. It is necessary to distinguish this specific eruption from a form of eczema which occurs in these situations in non-syphilitic children, the points that characterise the syphilitic condition being the infiltration of the skin and the coppery colour of the eruption. At the anus the papules acquire the characters of condylomata, also at the angles of the mouth, where they often ulcerate and leave radiating scars.

Affections of the Mucous Membranes.--The inflammation of the nasal mucous membrane that causes snuffles has already been referred to. There may be mucous patches in the mouth, or a stomatitis which is of importance, because it results in interference with the development of the permanent teeth. The mucous membrane of the larynx may be the seat of mucous patches or of catarrh, and as a result the child's cry is hoarse.

Affections of the Bones.--Swellings at the ends of the long bones, due to inflammation at the epiphyseal junctions, are most often observed at the upper end of the humerus and in the bones in the region of the elbow. Partial displacement and mobility at the ossifying junction may be observed. The infant cries when the part is touched; and as it does not move the limb voluntarily, the condition is spoken of as the pseudo-paralysis of syphilis. Recovery takes place under anti-syphilitic treatment and immobilisation of the limb.

Diffuse thickening of the shafts of the long bones, due to a deposit of new bone by the periosteum, is sometimes met with.

[Illustration: FIG. 44.--Facies of Inherited Syphilis.]

The conditions of the skull known as Parrot's nodes or bosses, and craniotabes, were formerly believed to be characteristic of inherited

syphilis, but they are now known to occur, particularly in rickety children, from other causes. The bosses result from the heaping up of new spongy bone beneath the pericranium, and they may be grouped symmetrically around the anterior fontanelle, or may extend along either side of the sagittal suture, which appears as a deep groove--the "natiform skull." The bosses disappear in time, but the skull may remain permanently altered in shape, the frontal and parietal eminences appearing unduly prominent. The term craniotabes is applied when the bone becomes thin and soft, reverting to its original membranous condition, so that the affected areas dimple under the finger like parchment or thin cardboard; its localisation in the posterior parts of the skull suggests that the disappearance of the osseous tissue is influenced by the pressure of the head on the pillow. Craniotabes is recovered from as the child improves in health.

Between the ages of three and six months, certain other phenomena may be met with, such as effusion into the joints, especially the knees; iritis, in one or in both eyes, and enlargement of the spleen and liver.

In the majority of cases the child recovers from these early manifestations, especially when efficiently treated, and may enjoy an indefinite period of good health. On the other hand, when it attains the age of from two to four years, it may begin to manifest lesions which correspond to those of the tertiary period of acquired syphilis.

#Later Lesions.--In the skin and subcutaneous tissue, the later manifestations may take the form of localised gummata, which tend to break down and form ulcers, on the leg for example, or of a spreading gummatous infiltration which is also liable to ulcerate, leaving disfiguring scars, especially on the face. The palate and fauces may be destroyed by ulceration. In the nose, especially when the ulcerative process is associated with a putrid discharge--ozaena--the destruction of tissue may be considerable and result in unsightly deformity. The entire palatal portions of the upper jaws, the vomer, turbinate, and other bones bounding the nasal and oral cavities, may disappear, so that on looking into the mouth the base of the skull is readily seen. Gummatous disease is frequently observed also in the flat bones of the skull, in the bones of the hand, as syphilitic dactylitis, and in the bones of the forearm and leg. When the tibia is affected the disease is frequently bilateral, and may assume the form of gummatous ulcers and sinuses. In later years the tibia may present alterations in shape resulting from antecedent gummatous disease--for example, nodular thickenings of the shaft, flattening of the crest, or a more uniform increase in thickness and length of the shaft of the bone, which, when it is curved in addition, is described as the "sabre-blade" deformity. Among lesions of the viscera, mention should be made of gumma of the testis, which causes the organ to become enlarged, uneven, and indurated. This has even been observed in infants a few months old.

Occasionally a syphilitic child suffers from a succession of these gummatous lesions with resulting ill-health, and, it may be, waxy disease of the internal organs; on the other hand, it may recover and present no further manifestations of the inherited taint.

Affections of the Eyes.--At or near puberty there is frequently observed an affection of the eyes, known as chronic interstitial keratitis, the relationship of which to inherited syphilis was first established by Hutchinson. It occurs between the ages of six and sixteen years, and usually affects one eye before the other. It commences as a diffuse haziness or steaminess near the centre of the cornea, and as it spreads the entire cornea assumes the appearance of ground glass. The chief complaint is of dimness of sight, which may almost amount to blindness, but there is little pain or photophobia; a certain amount of conjunctival and ciliary congestion is usually present, and there may be iritis in addition. The cornea, or parts of it, may become of a deep pink or salmon colour from the formation in it of new blood vessels. The affection may last for from eighteen months to two years. Complete recovery usually takes place, but slight opacities, especially in the site of former salmon patches, may persist, and the disease occasionally

relapses. Choroiditis and retinitis may also occur, and leave permanent changes easily recognised on examination with the ophthalmoscope.

Among the rarer and more serious lesions of the inherited disease may be mentioned gummatous disease in the larynx and trachea, attended with ulceration and resulting in stenosis; and lesions of the nervous system which may result in convulsions, paralysis, or dementia.

In a limited number of cases, about the period of puberty there may develop deafness, which is usually bilateral and may become absolute.

Changes in the Permanent Teeth.--These affect specially the upper central incisors, which are dwarfed and stand somewhat apart in the gum, with their free edges converging towards one another. They are tapering or peg-shaped, and present at their cutting margin a deep semilunar notch. These appearances are commonly associated with the name of Hutchinson, who first described them. Affecting as they do the permanent teeth, they are not available for diagnosis until the child is over eight years of age. Henry Moon drew attention to a change in the first molars; these are reduced in size and dome-shaped through dwarfing of the central tubercle of each cusp.

#Diagnosis of Inherited Syphilis.#--When there is a typical eruption on the buttocks and snuffles there is no difficulty in recognising the disease. When, however, the rash is scanty or is obscured by co-existing eczema, most reliance should be placed on the distribution of the eruption, on the brown stains which are left after it has passed off, on the presence of condylomata, and of fissuring and scarring at the angles of the mouth. The history of the mother relative to repeated miscarriages and still-born children may afford confirmatory evidence. In doubtful cases, the diagnosis may be aided by the Wassermann test and by noting the therapeutic effects of grey powder, which, in syphilitic infants, usually effects a marked and rapid improvement both in the symptoms and in the general health.

While a considerable number of syphilitic children grow up without showing any trace of their syphilitic inheritance, the majority retain throughout life one or more of the following characteristics, which may therefore be described as permanent signs of the inherited disease: Dwarfing of stature from interference with growth at the epiphysial junctions; the forehead low and vertical, and the parietal and frontal eminences unduly prominent; the bridge of the nose sunken and rounded; radiating scars at the angles of the mouth; perforation or destruction of the hard palate; Hutchinson's teeth; opacities of the cornea from antecedent keratitis; alterations in the fundus oculi from choroiditis; deafness; depressed scars or nodes on the bones from previous gummata; "sabre-blade" or other deformity of the tibiae.

#The Contagiousness of Inherited Syphilis.#--In 1837, Colles of Dublin stated his belief that, while a syphilitic infant may convey the disease to a healthy wet nurse, it is incapable of infecting its own mother if nursed by her, even although she may never have shown symptoms of the disease. This doctrine, which is known as Colles' law, is generally accepted in spite of the alleged occurrence of occasional exceptions. The older the child, the less risk there is of its communicating the disease to others, until eventually the tendency dies out altogether, as it does in the tertiary period of acquired syphilis. It should be added, however, that the contagiousness of inherited syphilis is denied by some observers, who affirm that, when syphilitic infants prove infective, the disease has been really acquired at or soon after birth.

There is general agreement that the subjects of inherited syphilis cannot transmit the disease by inheritance to their offspring, and that, although they very rarely acquire the disease de novo, it is possible for them to do so.

#Prognosis of Inherited Syphilis.#--Although inherited syphilis is responsible for a large but apparently diminishing mortality in infancy, the subjects of this disease may grow up to be as strong and healthy as

their neighbours. Hutchinson insisted on the fact that there is little bad health in the general community that can be attributed to inherited syphilis.

#Treatment.--Arsenical injections are as beneficial in the inherited as in the acquired disease. An infant the subject of inherited syphilis should, if possible, be nursed by its mother, and failing this it should be fed by hand. In infants at the breast, the drug may be given to the mother; in others, it is administered in the same manner as already described--only in smaller doses. On the first appearance of syphilitic manifestations it should be given 0.05 grm, novarsenbillon, injected into the deep subcutaneous tissues every week for six weeks, followed by one year's mercurial inunction--a piece of mercurial ointment the size of a pea being inserted under the infant's binder. In older children the dose is proportionately increased. The general health should be improved in every possible direction; considerable benefit may be derived from the use of cod-liver oil, and from preparations containing iron and calcium. Surgical interference may be required in the destructive gummatous lesions of the nose, throat, larynx, and bones, either with the object of arresting the spread of the disease, or of removing or alleviating the resulting deformities. In children suffering from keratitis, the eyes should be protected from the light by smoked or coloured glasses, and the pupils should be dilated with atropin from time to time, especially in cases complicated with iritis.

#Acquired Syphilis in Infants and Young Children.--When syphilis is met with in infants and young children, it is apt to be taken for granted that the disease has been inherited. It is possible, however, for them to acquire the disease--as, for example, while passing through the maternal passages during birth, through being nursed or kissed by infected women, or through the rite of circumcision. The risk of infection which formerly existed by the arm-to-arm method of vaccination has been abolished by the use of calf lymph.

The clinical features of the acquired disease in infants and young children are similar to those observed in the adult, with a tendency, however, to be more severe, probably because the disease is often late in being recognised and treated.

CHAPTER X

TUMOURS[2]

Definition--Etiology--General characters of innocent and malignant tumours. CLASSIFICATION OF TUMOURS: I. Connective-tissue tumours:
(1) Innocent: Lipoma, Xanthoma, Chondroma, Osteoma,
Odontoma, Fibroma, Myxoma, Endothelioma, etc.; (2)
Malignant: Sarcoma--II. Epithelial tumours: (1) Innocent:
Papilloma, Adenoma, Cystic Adenoma; (2) Malignant:
Epithelioma, Glandular Cancer, Rodent Cancer, Melanotic
Cancer--III. Dermoids--IV. Teratoma. Cysts: Retention,
Exudation, Implantation, Parasitic, Lymphatic or Serous.
Ganglion.

[2] For the histology of tumours the reader is referred to a text-book of pathology.

A tumour or neoplasm is a localised swelling composed of newly formed tissue which fulfils no physiological function. Tumours increase in size quite independently of the growth of the body, and there is no natural termination to their growth. They are to be distinguished from such over-growths as are of the nature of simple hypertrophy or local giantism, and also from inflammatory swellings, which usually develop under the influence of a definite cause, have a natural termination, and tend to disappear when the cause ceases to act.

The etiology of tumours is imperfectly understood. Various factors, acting either singly or in combination, may be concerned in their development. Certain tumours, for example, are the result of some congenital malformation of the particular tissue from which they take origin. This would appear to be the case in many tumours of blood vessels (angioma), of cartilage (chondroma), of bone (osteoma), and of secreting gland tissue (adenoma). The theory that tumours originate from foetal residues or "rests," is associated with the name of Cohnheim. These rests are supposed to be undifferentiated embryonic cells which remain embedded amongst fully formed tissue elements, and lie dormant until they are excited into active growth and give rise to a tumour. This mode of origin is illustrated by the development of dermoids from sequestered portions of epidermis.

Among the local factors concerned in the development of tumours, reference must be made to the influence of irritation. This is probably an important agent in the causation of many of the tumours met with in the skin and in mucous membranes--for example, cancer of the skin, of the lip, and of the tongue. The part played by injury is doubtful. It not infrequently happens that the development of a tumour is preceded by an injury of the part in which it grows, but it does not necessarily follow that the injury and the tumour are related as cause and effect. It is possible that an injury may stimulate into active growth undifferentiated tissue elements or "rests," and so determine the growth of a tumour, or that it may alter the characters of a tumour which already exists, causing it to grow more rapidly.

The popular belief that there is some constitutional peculiarity concerned in the causation of tumours is largely based on the fact that certain forms of new growth--for example, cancer--are known to occur with undue frequency in certain families. The same influence is more striking in the case of certain innocent tumours--particularly multiple osteomas and lipomas--which are hereditary in the same sense as supernumerary or webbed fingers, and appear in members of the same family through several generations.

INNOCENT AND MALIGNANT TUMOURS

For clinical purposes, tumours are arbitrarily divided into two classes--the innocent and the malignant. The outstanding difference between them is, that while the evil effects of innocent tumours are entirely local and depend for their severity on the environment of the growth, malignant tumours wherever situated, in addition to producing similar local effects, injure the general health and ultimately cause death.

Innocent, benign, or simple tumours present a close structural resemblance to the normal tissues of the body. They grow slowly, and are usually definitely circumscribed by a fibrous capsule, from which they are easily enucleated, and they do not tend to recur after removal. In their growth they merely push aside and compress adjacent parts, and they present no tendency to ulcerate and bleed unless the overlying skin or mucous membrane is injured. Although usually solitary, some are multiple from the outset--for example, fatty, fibrous, and bony tumours, warts, and fibroid tumours of the uterus. They produce no constitutional disturbance. They only threaten life when growing in the vicinity of vital organs, and then only in virtue of their situation--for example, death may result from an innocent tumour in the air-passage causing suffocation, in the intestine causing obstruction of the bowels, or in the vertebral canal causing pressure on the spinal medulla.

Malignant tumours usually show a marked departure from the structure and arrangement of the normal tissues of the body. Although the cells of which they are composed are derived from normal tissue cells, they tend to take on a lower, more vegetative form; they may be regarded as parasites living at the expense of the organism, multiplying indefinitely and destroying everything with which they come in contact.

Malignant tumours grow more rapidly than innocent tumours, and tend to

infiltrate their surroundings by sending out prolongations or offshoots; they are therefore liable to recur after an operation which is restricted to the removal of the main tumour. They are not encapsulated, although they may appear to be circumscribed by condensation of the surrounding tissues; they are rarely multiple at the outset, but show a marked tendency to spread to other parts of the body. Fragments of the parent tumour may become separated and be carried off in the lymph or blood-stream and deposited in other parts of the body, where they give rise to secondary growths. Malignant tumours tend to invade and destroy the overlying skin or mucous membrane, and thus give rise to bleeding ulcers; if the tumour tissue protrudes through the gap in the skin, it is said to fungate. In course of time they give rise to a condition of ill-health or cachexia, the patient becoming pale, sallow, feverish, and emaciated, probably as a result of chronic poisoning from the absorption of toxic products from the tumour. They ultimately destroy life, it may be by their local effects, such as ulceration and haemorrhage, by favouring the entrance of septic infection, by interfering with the function of organs which are essential to life, by cachexia, or by a combination of these effects.

The situation of a malignant tumour exercises considerable influence on the rapidity, as well as on the mode, in which it causes death. Some cancers, such as that known as "rodent," show malignant features which are entirely local, while others, such as melanotic cancer, exhibit a malignancy characterised by rapid generalisation of growths throughout the body. Tumours that are structurally alike may show variations in malignancy, according to their situation and to the age of the patient, as well as to other factors which are as yet unknown.

In attempting to arrive at a conclusion as to the innocence or malignancy of any tumour, too much reliance must not be placed on its histological features; its situation, rate of growth, and other clinical features must also be taken into consideration. It cannot be too emphatically stated that there is no hard-and-fast line between innocent and malignant growths; there is an indefinite transition from one to the other. The possibility of the transformation of a benign into a malignant tumour must be admitted. Such a transformation implies a change in the structure of the growth, and has been observed especially in fibrous and cartilaginous tumours, in tumours of the thyreoid gland, and in uterine fibroids. The alteration in character may take place under the influence of injury, prolonged or repeated irritation, incomplete removal of the benign tumour by operation, or the altered physiological conditions of the tissues which attend upon advancing years.

After a tumour has been removed by operation it should as a routine measure be subjected to microscopical examination; the results are often instructive and sometimes other than what was expected.

#Varieties of Tumours.---In the following description, tumours are classified on an anatomical basis, taking in order first the connective-tissue group and subsequently those that originate in epithelium.

INNOCENT CONNECTIVE-TISSUE TUMOURS

#Lipoma.---A lipoma is composed of fat resembling that normally present in the body. The commonest variety is the subcutaneous lipoma, which grows from the subcutaneous fat, and forms a soft, irregularly lobulated tumour (Fig. 45). The fat is arranged in lobules separated by connective-tissue septa, which are continuous with the capsule surrounding the tumour and with the overlying skin, which becomes dimpled or puckered when an attempt is made to pinch it up. As the fat is almost fluid at the body temperature, fluctuation can usually be detected. These tumours vary greatly in size, occur at all ages, grow slowly, and, while generally solitary, are sometimes multiple. They are most commonly met with on the shoulder, buttock, or back. In certain situations, such as the thigh and perineum, they tend to become pedunculated (Fig. 46).

A fatty tumour is to be diagnosed from a cold abscess and from a cyst. The distinguishing features of the lipoma are the tacking down and dimpling of the overlying skin, the lobulation of the tumour, which is recognised when it is pressed upon with the flat of the hand, and, more reliable than either of these, the mobility, the tumour slipping away when pressed upon at its margin.

[Illustration: FIG. 45.--Subcutaneous Lipoma showing lobulation.]

The prognosis is more favourable than in any other tumour as it never changes its characters; the only reasons for its removal by operation are its unsightliness and its probable increase in size in the course of years. The operation consists in dividing the skin and capsule over the tumour and shelling it out. Care must be taken that none of the outlying lobules are left behind. If the overlying skin is damaged or closely adherent, it should be removed along with the tumour.

[Illustration: FIG. 46.--Pedunculated Lipoma of Buttock of forty years' duration in a woman aet. 68.]

Multiple subcutaneous lipomas are frequently symmetrical, and in a certain group of cases, met with chiefly in women, pain is a prominent symptom, hence the term adiposis dolorosa (Dercum). These multiple tumours show little or no tendency to increase in size, and the pain which attends their development does not persist.

In the neck, axilla, and pubes a diffuse overgrowth of the subcutaneous fat is sometimes met with, forming symmetrical tumour-like masses, known as diffuse lipoma. As this is not, strictly speaking, a tumour, the term diffuse lipomatosis is to be preferred. A similar condition was described by Jonathan Hutchinson as being met with in the domestic animals. If causing disfigurement, the mass of fat may be removed by operation.

[Illustration: FIG. 47.--Diffuse Lipomatosis of Neck.]

Lipoma in other Situations.--The periosteal lipoma is usually congenital, and is most often met with in the hand; it forms a projecting lobulated tumour, which, when situated in the palm, resembles an angioma or a lymphangioma. The subserous lipoma arises from the extra-peritoneal fat in the posterior abdominal wall, in which case it tends to grow forwards between the layers of the mesentery and to give rise to an abdominal tumour; or it may grow from the extra-peritoneal fat in the anterior abdominal wall and protrude from one of the hernial openings or through an abnormal opening in the parietes, constituting a fatty hernia. A subsynovial lipoma grows from the fat surrounding the synovial membrane of a joint, and projects into its interior, giving rise to the symptoms of loose body. Lipomas are also met with growing from the adipose connective tissue between or in the substance of muscles, and, when situated beneath the deep fascia, such as the fascia lata of the thigh, the characteristic signs are obscured and a differential diagnosis is difficult. It may be differentiated from a cold abscess by puncture with an exploring needle.

[Illustration: FIG. 48.--Zanthoma of Hands in a girl aet. 14, showing multiple subcutaneous tumours (cf. Fig. 49).]

(Sir H. J. Stiles' case.)]

#Zanthoma# is a rare but interesting form of tumour, composed of a fibrous and fatty tissue, containing a granular orange-yellow pigment, resembling that of the corpus luteum. It originates in the corium and presents two clinical varieties. In the first of these, it occurs in the form of raised yellow patches, usually in the skin of the eyelids of persons after middle life, and in many instances is associated with chronic jaundice; the patches are often symmetrical, and as they increase in size they tend to fuse with another.

The second form occurs in children and adolescents; it may affect

several generations of the same family, and is often multiple, there being a combination of thickened yellow patches of skin and projecting tumours, some of which may attain a considerable size (Figs. 48 and 49). On section, the tumour tissue presents a brilliant orange or saffron colour.

There is no indication for removing the tumours unless for the deformity which they cause; exposure to the X-rays is to be preferred to operation.

[Illustration: FIG. 49.--Zanthoma showing Subcutaneous Tumours on Buttocks. From same patient as Fig. 48.]

#Chondroma.#--A chondroma is mainly composed of cartilage. Processes of vascular connective tissue pass in between the nodules of cartilage composing the tumour from the fibrous capsule which surrounds it. On section it is of a greyish-blue colour and semi-translucent. The tumour is firm and elastic in consistence, but certain portions may be densely hard from calcification or ossification, while other portions may be soft and fluctuating as a result of myxomatous degeneration and liquefaction. These tumours grow slowly and painlessly, and may surround nerves and arteries without injuring them. They may cause a deep hollow in the bone from which they originate. All intermediate forms between the innocent chondroma and the malignant chondro-sarcoma are met with. Chondroma may occur in a multiple form, especially in relation to the phalanges and metacarpal bones. When growing in the interior of a bone it causes a spindle-shaped enlargement of the shaft, which in the case of a phalanx or metacarpal bone may resemble the dactylitis resulting from tubercle or syphilis. A chondroma appears as a clear area in a skiagram.

A _skiagram_ of a bone in which there is a chondroma shows a clear rounded area in the position of the tumour, which must be differentiated from similar clear areas due to other kinds of tumour, especially the myeloma; when it has undergone calcification or ossification, it gives a shadow as dark as bone.

[Illustration: FIG. 50.--Chondroma growing from infraspinous fossa of Scapula.]

[Illustration: FIG. 51.--Chondroma of Metacarpal Bone of Thumb.]

Treatment.--In view of the unstable quality of the chondroma, especially of its liability to become malignant, it should be removed as soon as it is recognised. In those projecting from the surface of a bone, both the tumour and its capsule should be removed. If in the interior, a sufficient amount of the cortex should be removed to allow of the tumour being scraped out, and care must be taken that no nodules of cartilage are left behind. In multiple chondromas of the hand, when the fingers are crippled and useless, exposure to the X-rays should be given a trial, and in extreme cases the question of amputation may have to be considered. When a cartilaginous tumour takes on active growth, it must be treated as malignant.

The chondromas that are met with at the ends of the long bones in children and young adults form a group by themselves. They are usually related to the epiphysial cartilage, and it was suggested by Virchow that they take origin from islands of cartilage which have not been used up in the process of ossification. They are believed to occur more frequently in those who have suffered from rickets. They have no malignant tendencies and tend to undergo ossification concurrently with the epiphysial cartilage from which they take origin, and constitute what are known as cartilaginous exostoses. These are sometimes met with in a multiple form, and may occur in several generations of the same family. They are considered in greater detail in the chapter dealing with tumours of bone.

Minute nodules of cartilage sometimes form in the synovial membrane of joints and lining of tendon sheaths and bursae: they tend to become detached from the membrane and constitute loose bodies; they also

undergo a variable amount of calcification and ossification, so as to be visible in skiagrams. They are further considered with loose bodies in joints.

Cartilaginous tumours in the parotid, submaxillary gland, and testicle belong to a class of "mixed tumours" that will be referred to later.

#Osteoma.--The true osteoma is composed of bony tissue, and originates from the skeleton. Two varieties are recognised--the spongy or cancellous, and the ivory or compact. The spongy or cancellous osteoma is really an ossified chondroma, and is met with at the ends of the long bones (Fig. 52). From the fact that it projects from the surface of the bone it is often spoken of as an exostosis. It grows slowly, and rarely causes any discomfort unless it presses upon a nerve-trunk or upon a bursa which has developed over it. The Rontgen rays show a dark shadow corresponding to the ossified portion of the tumour, and continuous with that of the bone from which it is growing (Fig. 138). Operative interference is only indicated when the tumour is giving rise to inconvenience. It is then removed, its base or neck being divided by means of the chisel. The multiple variety of osteoma is considered with the diseases of bone.

The bony outgrowth from the terminal phalanx of the great toe--known as the subungual exostosis--is described and figured on p. 404. Bony projections or "spurs" sometimes occur on the under surface of the calcaneus, and, projecting downwards and forwards from the greater process, cause pain on putting the heel to the ground.

[Illustration: FIG. 52.--Cancellous Osteoma of lower end of Femur.]

The ivory or compact osteoma is composed of dense bone, and usually grows from the skull. It is generally sessile and solitary, and may grow into the interior of the skull, into the frontal sinus, into the cavity of the orbit or nose, or may fill up the external auditory meatus, causing most unsightly deformity and interference with sight, breathing, and hearing.

Bony formations occur in muscles and tendons, especially at their points of attachment to the skeleton, and are known as false exostoses; they are described with the diseases of muscles.

#Odontoma.--An odontoma is composed of dental tissues in varying proportions and different degrees of development, arising from tooth-germs or from teeth still in process of growth (Bland Sutton). Odontomas resemble teeth in so far that during their development they remain hidden below the mucous membrane and give no evidence of their existence. There then succeeds, usually between the twentieth and twenty-fifth years, an eruptive stage, which is often attended with suppuration, and this may be the means of drawing attention to the tumour. Following Bland Sutton, several varieties of odontoma may be distinguished according to the part of the tooth-germ concerned in their formation.

The epithelial odontoma is derived from persistent portions of the epithelium of the enamel organ, and constitutes a multilocular cystic tumour which is chiefly met with in the mandible. The cystic spaces of the tumour contain a brownish glairy fluid. These tumours have been described by Eve under the name of multilocular cystic epithelial tumours of the jaw.

The follicular odontoma, also known as a dentigerous cyst, is derived from the distension of a tooth follicle. It constitutes a cyst containing a viscid fluid, and an imperfectly formed tooth is often found embedded in its wall. The cyst usually forms in relation to one of the permanent molars, and may attain considerable dimensions.

The fibrous odontoma is the result of an overgrowth of fibrous tissue surrounding the tooth sac, which encapsulates the tooth and prevents its eruption. The thickened tooth sac is usually mistaken for a fibrous tumour, until, after removal, the tooth is recognised in its interior.

Composite Odontoma.--This is a convenient term to apply to certain hard dental tumours which are met with in the jaws, and consist of enamel, dentine, and cement. The tumour is to be regarded as being derived from an abnormal growth of all the elements of a tooth germ, or of two or more tooth germs, indiscriminately fused with one another. It may appear in childhood, and form a smooth unyielding tumour, often of considerable size, replacing the corresponding permanent tooth. It may cause a purulent discharge, and in some cases it has been extruded after sloughing of the overlying soft parts. Many examples of this variety of odontoma, growing in the nasal cavity or in the maxillary sinus, have been erroneously regarded as osteomas even after removal.

On section, the tumour is usually laminated, and is seen to consist mainly of dentine with a partial covering of enamel and cement.

Diagnosis.--Odontomas are often only diagnosed after removal. When attended with suppuration, the condition has been mistaken for disease of the jaw. Fibrous odontomas have been mistaken for sarcoma, and portions of the maxilla removed unnecessarily. Any circumscribed tumour of the jaw, particularly when met with in a young adult, should suggest the possibility of an odontoma. Skiagrams often give useful information both for diagnosis and for treatment.

Treatment.--The solid varieties of odontoma can usually be shelled out after dividing the overlying soft parts. In the follicular variety, it is usually sufficient to excise a portion of the wall, scrape out the interior, and remove any tooth that may be present. The cavity is then packed and allowed to heal from the bottom.

#Fibroma.#--A fibroma is a tumour composed of fibrous connective tissue. A distinction may be made between the soft fibroma, which is comparatively rich in cells and blood vessels, and in which the fibres are arranged loosely; and the hard fibroma, which is composed of closely packed bundles of fibres often arranged in a concentric fashion around the blood vessels. The cut surface of the soft fibroma presents a pinkish-white, fleshy appearance, resembling the slowly growing forms of sarcoma; that of a hard fibroma presents a dry, glistening appearance, aptly compared to watered silk. The soft variety grows much more rapidly than the hard. In certain fibromas--in those, for example, which grow from the periosteum of the base of the skull and project into the naso-pharynx--the blood vessels are dilated into sinuses and have no proper sheaths; they therefore tend to remain open when divided, and to bleed excessively. Transition forms between soft fibroma and sarcoma are met with, so that in operating for their removal it is safer to take away the capsule along with the tumour, and the patient should be kept under observation in view of the risk of recurrence.

The skin--especially the skin of the buttock--is one of the favourite seats of fibroma, and it may occur in a multiple form. It is met with also in the subcutaneous and intermuscular cellular tissue, and in the abdominal wall, where it sometimes attains considerable dimensions. Various forms of fibroma are met with in the mamma and are described with diseases of that organ. The fibrous overgrowths in the skin, known as keloid and molluscum fibrosum, and those met with in the sheaths of nerves, are described elsewhere. Fibroid tumours of the uterus are described with myoma.

Diffuse fibroma or Fibromatosis, analogous to lipomatosis, is met with in the connective tissue of the skin and sheaths of nerves, and constitutes one form of neuro-fibromatosis; a similar change is also met with in the stomach and colon.

#Myxoma.#--A myxoma is composed of tissue of a soft gelatinous, semifluid consistence. The pure myxoma is extremely rare, and clinically resembles the lipoma. Myxomatous tissue is, however, frequently found in other connective-tissue tumours as a result of degeneration, for example, in cartilaginous tumours and in sarcomas. Myxomatous tissue is also a prominent constituent of the "innocent parotid tumour." Mucous polypus of the nose, which is often described as

a myxoma, is merely a pendulous process of oedematous mucous membrane.

[Illustration: FIG. 53.--Myeloma of Shaft of Humerus, causing pathological fracture. (Mr. J. W. Struthers' case.)

(The unusual site of the tumour is to be noted.)]

#Myeloma.#--A myeloma is composed of large multinuclear giant cells surrounded by round and spindle cells. The cut surface of the tumour presents a deep red or maroon colour. While occasionally met with in tendon sheaths and bursae, and is then of an orange-yellow colour, the myeloma occurs most frequently in the cancellous tissue at the ends of the long bones, its favourite site being the upper end of the tibia. Although formerly classified as a sarcoma, it is the exception for it to present malignant features, and it can usually be extirpated by local measures without fear of recurrence. The diagnosis, X-ray appearances, and the method of removal are considered with the diseases of bone. Sometimes the myeloma is met with in multiple form in the skeleton, in association with an unusual form of protein in the urine (Bence Jones).

#Myoma.#--A myoma is composed of non-striped muscle fibres. A pure myoma is very rare, and is met with in organs possessed of non-striped muscle, such as the stomach, intestine, urinary bladder, and prostate. In the uterus, which is the most common situation, these tumours contain a considerable admixture of fibrous tissue, and are known as fibroids or fibro-myomas. They present on section a fasciculated appearance, which may resemble that of a section of balls of cotton (Fig. 54). They are encapsulated and vascular, frequently attain a large size, and may be single or multiple. While they may occasion neither inconvenience nor suffering, they frequently give rise to profuse haemorrhage from the uterus, and may cause serious symptoms by pressing injuriously on the ureters or the intestine, or by complicating pregnancy and parturition.

The #Rhabdomyoma# is an extremely rare form of tumour, met with in the kidney, uterus, and testicle. It contains striped muscle fibres, and is supposed to originate from a residue of muscular tissue which has become sequestrated during development.

[Illustration: FIG. 54.--Fibro-myoma of Uterus.

(Anatomical Museum, University of Edinburgh.)]

#Glioma.#--A glioma is a tumour composed of neuroglia. It is met with exclusively in the central nervous system, retina, and optic nerve. It is a slowly growing, soft, ill-defined tumour, which displaces the adjacent nerve centres and nerve tracts, and is liable to become the seat of haemorrhage and thus to give rise to pressure symptoms resembling apoplexy. The glioma of the retina tends to grow into the vitreous humour and to perforate the globe. It is usually of the nature of a glio-sarcoma and is highly malignant.

#Endotheliomas# take origin from the endothelium of lymph vessels and blood vessels, and serous cavities. They show great variation in type, partly because of the number of different kinds of endothelium from which they are derived, and partly because the new connective tissue which is formed is liable to undergo transformation into other tissues. They may be soft or hard, solid or cystic, diffuse or circumscribed; they grow very slowly, and are almost always innocent, although recurrence has been occasionally observed. Cases of multiple endotheliomata of the skin have recently been described by Wise.

Angioma, lymphangioma, and neuroma are described with the disease of the individual tissues.

MALIGNANT CONNECTIVE-TISSUE TUMOURS--SARCOMA

The term sarcoma is applied to any connective-tissue tumour which exhibits malignant characters. The essential structural feature is the predominance of the cellular elements over the intercellular substance

or stroma, in which respect a sarcoma resembles the connective tissue of the embryo. The typical sarcoma consists chiefly of immature or embryonic connective tissue. It most frequently originates from fascia, intermuscular connective tissue, periosteum, bone-marrow, and skin, and forms a rounded or nodulated tumour which appears to be encapsulated, but the capsule merely consists of the condensed surrounding tissues, and usually contains sarcomatous elements. The consistence of the tumour depends on the nature and amount of the stroma, and on the presence of degenerative changes. The softer medullary forms are composed almost exclusively of cells; while the harder forms--such as the fibro-, chondro-, and osteo-sarcoma--are provided with an abundant stroma and are relatively poor in cells. Degenerative changes may produce areas of softening or liquefaction which result in the formation of cystic cavities in the interior of the tumour. The colour depends on the amount of blood in the tumour, and on the presence of the products of degeneration.

The blood vessels are usually represented by mere chinks or spaces between the cells. This peculiarity accounts for the facility with which haemorrhage takes place into the substance of the tumour, the persistence of the bleeding when it is incised or ulcerates through the skin, and the readiness with which the sarcomatous cells are carried off and infect distant parts through the blood-stream. Sarcomas are devoid of lymphatics, and unless originating in lymphatic structures--for example, in the tonsil--they rarely infect the lymph glands. Minute portions of the tumour grow into the small veins, and, becoming detached, are transported by the blood-current to distant organs, where they are arrested in the capillaries and give rise to secondary growths. These are most frequently situated in the lungs, except when the primary growth lies within the territory of the portal circulation, in which case they occur in the liver. The secondary growths closely resemble the parent tumour. Sarcoma may invade an adjacent vein on such a scale that if the invading portion becomes detached it may constitute a dangerous embolus. This may be observed in sarcoma of the kidney, the growth taking place along the renal vein until it projects into the vena cava.

[Illustration: FIG. 55.--Recurrent Sarcoma of Sciatic Nerve in a woman aet. 27. Recurrence twenty months after removal of primary growth.]

In its growth, a sarcoma compresses and destroys neighbouring parts, surrounds vessels and nerves, and may lead to destruction of the skin, either by invading it, or more commonly by causing sloughing from pressure. Inflammatory and suppurative changes may take place as a result of pyogenic infection following upon sloughing of the overlying skin or upon an exploratory incision. Once the skin is broken the tumour fungates through the opening. Sarcomas vary in malignancy, especially as regards rapidity of growth and capacity for dissemination. Certain of them, such as the so-called "recurrent fibroid of Paget," grow comparatively slowly, and are only malignant in the sense that they tend to recur locally after removal; others--especially the more cellular ones--grow with extreme rapidity, and are early disseminated throughout the body, resembling in these respects the most malignant forms of cancer. They are usually solitary in the first instance, although primary multiple growths are occasionally met with in the skin and in the bones.

Many varieties of sarcoma are recognised, according to its structural peculiarities. Thus, in virtue of the size and character of the cells, we have the small round-celled and the large round-celled sarcoma, the small and the large spindle-celled, the giant-celled and the mixed-celled sarcoma. The lympho-sarcoma presents a structure similar to that of lymph-follicular tissue, and the alveolar sarcoma an arrangement of cells in alveoli resembling that seen in cancers. When there is a considerable amount of intercellular fibrous tissue, the tumour is called a fibro-sarcoma.

[Illustration: FIG. 56.--Fungating Sarcoma of Arm.

(Dr. J. M'Watt's case.)]

The term lymphangio-sarcoma is applied when the cells of the tumour are derived from the endothelium of lymph spaces and vessels. The angio-sarcomas are those in which blood vessels form a prominent element in the structure of the tumour. They are sometimes derived from innocent angiomas, and they may be so vascular as to pulsate and on auscultation yield a blowing murmur like an aneurysm. The glio-sarcoma, myxo-sarcoma, chondro-sarcoma, and myo-sarcoma are mixed forms which usually develop in pre-existing innocent tumours. The osteosarcoma is characterised by the formation in the tumour of bone, the medullary spaces being occupied by sarcomatous cells in place of marrow. The osteoid sarcoma is characterised by the formation of a tissue resembling bone but deficient in lime salts, and the petrifying sarcoma by the formation of calcified areas in the stroma. These varieties, although met with chiefly in the bones, may occur in soft tissues such as muscle, and in such organs as the mamma. The pigmented varieties include the chloroma, which is of a light-green colour, and the melanotic sarcoma, which is brown or black. The psammoma is a sarcoma containing a material resembling sand; it is chiefly met with in the membranes of the brain. The chordoma is a rare form of tumour originating from the remains of the notochord in the region of the spheno-occipital synchondrosis or in the sacro-coccygeal region.

Diagnosis of Sarcoma.--A sarcoma is to be differentiated from an inflammatory swelling such as results from tubercle, actinomycosis, or syphilis, from an innocent tumour, and from a cancer. The points on which the diagnosis is founded are discussed with the different tissues and organs.

Treatment.--The removal of the tumour by operation is the most reliable method of treatment; in order to be successful it must be undertaken before dissemination has taken place, and a considerable area of healthy tissue beyond the apparent margin of the growth must be removed, and in tumours near the surface of the body, the overlying skin also.

In order to prevent recurrence, a tube of radium, to which a silk thread is attached, is inserted into the space from which the tumour was removed; the thread is brought out at the drain-opening, and at the end of a week or ten days the tube of radium is removed by pulling on the thread. Radium causes a reaction in the tissues attended with exudation from the vessels, for the escape of which provision must be made. If radium is not available, the affected area is repeatedly exposed to the action of the X-rays as soon as the wound has healed. The employment of these measures has diminished to a remarkable degree the recurrence of sarcoma after operation.

It will readily be understood that the less thoroughly or radically the growth has been removed, the more do we depend upon radium or the X-rays for bringing about a permanent cure, and that in advanced cases of sarcoma and in cases in which, on account of their anatomical situation, removal by operation is necessarily incomplete, the prospect of cure is still more dependent on the use of radium or of the X-rays. Finally, there are cases in which removal by operation is impossible, the so-called inoperable sarcoma; a tube of radium, to which a silk thread is attached, is inserted into the substance of the tumour, either through an opening made by a large trocar, or, when necessary, by open dissection. A second tube of radium is placed upon the skin over the tumour and is secured there by a stitch or by a strip of plaster, thus securing a cross-fire action of the radium rays, both from within and without, as this is found to be much more efficacious in destroying or inhibiting the cellular elements of the growth. The tubes of radium are left in situ for from eight to fourteen days, according to the power of the radium employed, but are moved about every second day or so in order that every part of the tumour may be efficiently radiated. If the tumour shrinks in size after the use of radium and becomes operable, it should be removed before time is given it to resume its growth. It will depend upon the subsequent course of the disease, whether or not a second, or it may be even a third, application of radium will be required.

Where neither radium nor X-rays is available or applicable, recourse may be had to the injection of Coley's fluid, a preparation containing the mixed toxins of the streptococcus of erysipelas and the bacillus prodigiosus; or of selenium.

EPIHELIAL TUMOURS

An excessive and erratic growth of epithelium is the essential and distinguishing feature of these tumours. The innocent forms are the papilloma and the adenoma; the malignant, the carcinoma or cancer.

#Papilloma.#--A papilloma is a tumour which projects from a cutaneous or mucous surface, and consists of a central axis of vascular fibrous tissue with a covering of epithelium resembling that of the surface from which the tumour grows. In the papillomas of the skin--commonly known as warts--the covering consists of epidermis; in those growing from mucous surfaces it consists of the epithelium covering the mucous membrane. When the surface epithelium projects as filiform processes, the tumour is called a villous papilloma, the best-known example of which is met with in the urinary bladder. Papillomatous growths are also met with in the larynx, in the ducts of the breast, and in the interior of certain cystic tumours of the breast and of the ovary. Although papillomas are primarily innocent, they may become the starting-point of cancer, especially in persons past middle life and if the papilloma has been subjected to irritation and has ulcerated. The clinical features and treatment of the various forms of papilloma are considered with the individual tissues and organs.

#Adenoma.#--An adenoma is a tumour constructed on the type of, and growing in connection with, a secreting gland. In the substance of such glands as the mamma, parotid, thyreoid, and prostate, adenomas are met with as encapsulated tumours. When they originate from the glands of the skin or of a mucous membrane, they tend to project from the surface, and form pedunculated tumours or polypi.

Adenomas may be single or multiple, and they vary greatly in size. The tumour is seldom composed entirely of gland tissue; it usually contains a considerable proportion of fibrous tissue, and is then called a fibro-adenoma. When it contains myxomatous tissue it is called a myxo-adenoma, and when the gland spaces of the tumour become distended with accumulated secretion, a cystic adenoma, the best examples of which are met with in the mamma and ovary. A characteristic feature of the cystic variety is the tendency the tumour tissue exhibits to project into the interior of the cysts, constituting what are known as intracystic growths. They are essentially innocent, but intracystic growths, especially in the mamma of women over fifty, should be regarded with suspicion and therefore should be removed on radical lines. Transition forms between adenoma and carcinoma are also met with in the rectum and large intestine, and these should be treated on the same lines as cancer.

CARCINOMA OR CANCER

A cancer is a malignant tumour which originates in epithelium. The cancer cells are derived by proliferation from already existing epithelium, and they invade the sub-epithelial connective tissue in the form of simple or branching columns. These columns are enclosed in spaces--termed alveoli--which are probably dilated lymph spaces, and which communicate freely with the lymph vessels. The cells composing the columns and filling the alveoli vary with the character of the epithelium in which the cancer originates. The malignancy of cancer depends on the tendency which the epithelium has of invading the tissues in its neighbourhood, and on the capacity of the cells, when transported elsewhere by the lymph or blood-stream, of giving rise to secondary growths.

Cancer may arise on any surface covered by epithelium or in any of the secreting glands of the body, but it is much more common in some

situations than in others. It is frequently met with, for example, in the skin, in the stomach and large intestine, in the breast, the uterus, and the external genitals; less frequently in the gall-bladder, larynx, thyroid, prostate, and urinary bladder.

Tissues appear to be most liable to cancer when, having attained maturity, they enter upon the phase of decadence or involution, and this phase is reached by different tissues at different periods. It is not so much, therefore, the age of the person in whom it occurs, as the age of the tissue in which it arises, that determines the maximum incidence of cancer. Cancer of the stomach appears and attains a maximum frequency earlier than cancer of the skin; cancer of the uterus and mamma is more frequent towards the decline of reproductive activity than in the later years of life; rectal cancer is not infrequently met with during the second and third decades. There is evidence that the irritation caused by alcohol and tobacco plays a part in the causation of cancer, in the fact that a large proportion of those who become the subjects of cancer of the mouth are excessive drinkers and smokers.

A cancer may appear as a papillary growth on a mucous or a skin surface, as a nodule in the substance of an organ, or as a diffuse thickening of a tubular organ such as the stomach or intestine. The absence of definition in cancerous tumours explains the difficulty of completely removing them by surgical measures, and has led to the practice of complete extirpation of cancerous organs wherever this is possible. The boundaries of the affected organ, moreover, are frequently transgressed by the disease, and the epithelial infiltration implicates the surrounding parts. In cancer of the breast, for example, the disease often extends to the adjacent skin, fat, and muscle; in cancer of the lip or tongue, to the mandible; in cancer of the uterus or intestine, to the investing peritoneum.

In addition to its tendency to infiltrate adjacent tissues and organs, cancer is also liable to give rise to secondary growths. These are most often met with in the nearest lymph glands; those in the neck, for example, becoming infected from cancer of the lip, tongue, or throat; those in the axilla, from cancer of the breast; those along the curvatures of the stomach, from cancer of the pylorus; and those in the groin, from cancer of the external genitals. In lymph vessels the cancer cells may merely accumulate so as to fill the lumen and form indurated cords, or they may proliferate and give rise to secondary nodules along the course of the vessels. When the lymphatic network in the skin is diffusely infected, the appearance is either that of a multitude of secondary nodules or of a diffuse thickening, so that the skin comes to resemble coarse leather. On the wall of the chest this condition is known as cancer en cuirasse. Although the cancer cells constantly attack the walls of the adjacent veins and spread into their interior at a comparatively early period, secondary growths due to dissemination by the blood-stream rarely show themselves clinically until late in the course of the disease. It is probable that many of the cancer cells which are carried away in the blood or lymph stream undergo necrosis and fail to give rise to secondary growths. Secondary growths present a faithful reproduction of the structure of the primary tumour. Apart from the lymph glands, the chief seats of secondary growths are the liver, lungs, serous membranes, and bone marrow.

It is generally believed that the secondary growths in cancer that develop at a distance from the primary tumour, those, for example, in the medullary canal of the femur or in the diploe of the skull occurring in advanced cases of cancer of the breast, are the result of dissemination of cancer cells by way of the blood-stream and are to be regarded as emboli. Sampson Handley disagrees with this view; he believes that the dissemination is accomplished in a more subtle way, namely, by the actual growth of cancer cells along the finer vessels of the lymph plexuses that ramify in the deep fascia, a method of spread which he calls permeation. It is maintained also that permeation occurs as readily against the lymph stream as with it. He compares the spread of cancer to that of an invisible annular ringworm. The growing edge extends in a wider and wider circle, within which a healing process may occur, so that the area of permeation is a ring, rather than a disc.

Healing occurs by a process of "peri-lymphatic fibrosis," but as the natural process of healing may fail at isolated points, nodules of cancer appear, which, although apparently separate from the primary growth, have developed in continuity with it, peri-lymphatic fibrosis having destroyed the cancer chain connecting the nodule with the primary growth. This centrifugal spread of cancer is clearly seen in the distribution of the subcutaneous secondary nodules so frequently met with in the late stages of mammary cancer. The area within which the secondary nodules occur is a circle of continually increasing diameter with the primary growth in the centre.

In the rare cases in which the skin of the greater part of the body is affected, the nodules rarely appear below the level of the deltoid or the middle third of the thigh, the patient dying before the spread can reach the distal portions of the limbs.

Handley argues against the embolic origin of the metastases in the bones because of the rarity of these in the bones of the distal parts of the limbs, because of the fact that secondary cancer of the femur nearly always commences in the upper third of the shaft, which harmonises with the intimate connection of the deep fascia with the periosteum over the great trochanter, thus favouring invasion of the bone marrow when permeation has spread thus far. He claims support for the permeation theory from the fact that the humerus is rarely involved below the insertion of the deltoid, and that spontaneous fracture of the femur is three times more common on the side on which the breast cancer is situated.

The tumour tissue may undergo necrosis, and when the overlying skin or mucous membrane gives way an ulcer is formed. The margins of a cancerous ulcer (Fig. 57) are made up of tumour tissue which has not broken down. Usually they are irregular, nodularly thickened or indurated; sometimes they are raised and crater-like. The floor of the ulcer is smooth and glazed, or occupied by necrosed tissue, and the discharge is watery and blood-stained, and as a result of putrefactive changes may become offensive. Haemorrhage is rarely a prominent feature, but discharge of blood may constitute a symptom of considerable diagnostic importance in cancer of internal organs such as the rectum, the bladder, or the uterus.

[Illustration: FIG. 57---Carcinoma of Breast with Cancerous Ulcer.]

The Contagiousness of Cancer.---A limited number of cases are on record in which a cancer appears to have been transferred by contact, as from the lower to the upper lip, from one labium majus to the other, from the tongue to the cheek, and from one vocal cord to the other; these being all examples of cancer involving surfaces which are constantly or frequently in contact. The transference of cancer from one human being to another, whether by accident, as in the case of a surgeon wounding his finger while operating for cancer, or by the deliberate introduction of a portion of cancerous tumour into the tissues, has never been known to occur. It is by no means infrequent, however, that when recurrence takes place after an operation for the removal of cancer, the recurrent nodules make their appearance in the main scar or in the scars of stitches in its neighbourhood. In the lower animals the grafting of cancer only succeeds in animals of the same species; for example, a cancer taken from a mouse will not grow in the tissues of a rat, but only in a mouse of the same variety as that from which the graft was taken.

While cancer cannot be regarded as either contagious or infectious, it is important to bear in mind the possibility of infection of a wound with cancer when operating for the disease. A cancer should not be cut into unless this is essential for purposes of diagnosis, and the wound made for exploration should be tightly closed by stitches before the curative operation is proceeded with; the instruments used for the exploration must not be used again until they have been boiled. The greatest care should be taken that a cancer which has softened or broken down is not opened into during the operation.

Investigations regarding the cause of cancer have been prosecuted with great energy during recent years, but as yet without positive result. It is recognised that there are a number of conditions which favour the development of cancer, such as prolonged irritation, and a considerable number of cases have been recorded in which cancer of the skin of the hands has followed prolonged and repeated exposure to the Rontgen rays.

The Alleged Increase of Cancer.--Regarding the alleged increase of cancer, it may be pointed out that it is impossible to ascertain how much of the apparent increase is due to more accurate diagnosis and improved registration. It is probable also that some increase has taken place in consequence of the increased average duration of life; a larger proportion of persons now reach the age at which cancer is frequent.

The prognosis largely depends on the variety of cancer and on its situation. Certain varieties--such as the atrophic cancer of the breast which occurs in old people, and some forms of cancer in the rectum--are so indolent in their progress that they can scarcely be said to shorten life; while others--such as the softer varieties of mammary cancer occurring in young women--are among the most malignant of tumours. The mode in which cancer causes death depends to a large extent upon its situation. In the gullet, for example, it usually causes death by starvation; in the larynx or thyroid, by suffocation; in the intestine, by obstruction of the bowels; in the uterus, prostate, and bladder, by haemorrhage or by implication of the ureters and kidneys. Independently of their situation, however, cancers frequently cause death by giving rise to a progressive impairment of health known as the cancerous cachexia, a condition which is due to the continued absorption of poisonous products from the tumour. The patient loses appetite, becomes emaciated, pale, and feverish, and gradually loses strength until he dies. In many cases, especially those in which ulceration has occurred, the addition of pyogenic infection may also be concerned in the failure of health.

Treatment.--Removal by surgical means affords the best prospect of cure. If carcinomatous disease is to be rooted out, its mode of spread by means of the lymph vessels must be borne in mind, and as this occurs at an early stage, and is not evident on examination, a wide area must be included in the operation. The organ from which the original growth springs should, if practicable, be altogether removed, because its lymph vessels generally communicate freely with each other, and secondary deposits have probably already taken place in various parts of it. In addition, the nearest chain of lymph glands must also be removed, even though they may not be noticeably enlarged, and in some cases--in cancer of the breast, for example--the intervening lymph vessels should be removed at the same time.

The treatment of cancer by other than operative methods has received a great deal of attention within recent years, and many agents have been put to the test, e.g. colloidal suspensions of selenium, but without any positive results. Most benefit has resulted from the use of radium and of the X-rays, and one or other should be employed as a routine measure after every operation for cancer.

It has been demonstrated that cancer cells are more sensitive to radium and to the Rontgen rays than the normal cells of the body, and are more easily killed. The effect varies a good deal with the nature and seat of the tumour. In rodent cancers of the skin, for example, both radium and X-ray treatment are very successful, and are to be preferred to operation because they yield a better cosmetic result. While small epitheliomas of the skin may be cured by means of the rays, they are not so amenable as rodent cancers.

Cancers of mucous membranes are less amenable to ray treatment because they are less circumscribed and are difficult of access. In cancers under the skin, the Rontgen rays are less efficient; if radium is employed, the tube containing it should be inserted into the substance of the tumour after the method described in connection with sarcoma--and another tube should be placed on the overlying skin.

In the employment of X-rays and of radium in the treatment of cancer, experience is required, not only to obtain the maximum effect of the rays, but to avoid damage to the adjacent and overlying tissues.

Ray treatment is not to be looked upon as a rival but as a powerful supplement to the operative treatment of cancer.

VARIETIES OF CANCER

The varieties of cancer are distinguished according to the character and arrangement of the epithelial cells.

The squamous epithelial cancer or epithelioma originates from a surface covered by squamous epithelium, such as the skin, or the mucous membrane of the mouth, gullet, or larynx. The cancer cells retain the characters of squamous epithelium, and, being confined within the lymph spaces of the sub-epithelial connective tissue, become compressed and undergo a horny change. This results in the formation of concentrically laminated masses known as cell nests.

The clinical features are those of a slowly growing indurated tumour, which nearly always ulcerates; there is a characteristic induration of the edges and floor of the ulcer, and its surface is often covered with warty or cauliflower-like outgrowths (Fig. 58). The infection of the lymph glands is early and constant, and constitutes the most dangerous feature of the disease; the secondary growths in the glands exhibit the characteristic induration, and may themselves break down and lead to the formation of ulcers.

[Illustration: FIG. 58.--Epithelioma of Lip.]

Epithelioma frequently originates in long-standing ulcers or sinuses, and in scars, and probably results from the displacement and sequestration of epithelial cells during the process of cicatrisation.

The columnar epithelial cancer or columnar epithelioma originates in mucous membranes covered with columnar epithelium, and is chiefly met with in the stomach and intestine. As it resembles an adenoma in structure it is sometimes described as a malignant adenoma. Its malignancy is shown by the proliferating epithelium invading the other coats of the stomach or intestine, and by the development of secondary growths.

Glandular carcinoma originates in organs such as the breast, and in the glands of mucous membranes and skin. The epithelial cells are not arranged on any definite plan, but are closely packed in irregularly shaped alveoli. If the alveoli are large and the intervening stroma is scanty and delicate, the tumour is soft and brain-like, and is described as a medullary or encephaloid cancer. If the alveoli are small and the intervening stroma is abundant and composed of dense fibrous tissue, the tumour is hard, and is known as a scirrhouss cancer--a form which is most frequently met with in the breast. If the cells undergo degeneration and absorption and the stroma contracts, the tumour becomes still harder, and tends to shrink and to draw in the surrounding parts, leading, in the breast, to retraction of the nipple and overlying skin, and in the stomach and colon to narrowing of the lumen. When the cells of the tumour undergo colloid degeneration, a colloid cancer results; if the degeneration is complete, as may occur in the breast, the malignancy is thereby greatly diminished; if only partial, as is more common in rectal cancer, the malignancy is not appreciably affected. Melanin pigment is formed in relation to the cells and stroma of certain epithelial tumours, giving rise to melanotic cancer, one of the most malignant of all new growths. Cyst-like spaces may form in the tumour by the accumulation of the secretion of the epithelial cells, or as a result of their degeneration--cystic carcinoma. This is met with chiefly in the breast and ovary, and the tumour resembles the cystic adenoma, but it tends to infect its surroundings and gives rise to secondary growths.

Rodent cancer originates in the glands of the skin, and presents a special tendency to break down and ulcerate on the surface (Figs. 102 and 103). It almost never infects the lymph glands.

DERMOIDS

A dermoid is a tumour containing skin or mucous membrane, occurring in a situation where these tissues are not met under normal conditions.

The skin dermoid, or derma-cyst as it has been called by Askanazy, arises from a portion of epiblast, which has become sequestrated during the process of coalescence of two cutaneous surfaces in development. This form is therefore most frequently met with on the face and neck in the situations which correspond to the various clefts and fissures of the embryo. It occurs also on the trunk in situations where the lateral halves of the body coalesce during development. Such a dermoid usually takes the form of a globular cyst, the wall of which consists of skin, and the contents of turbid fluid containing desquamated epithelium, fat droplets, cholesterol crystals, and detached hairs. Delicate hairs may also be found projecting from the epithelial lining of the cyst.

Faulty coalescence of the cutaneous covering of the back occurs most frequently over the lower sacral vertebrae, giving rise to small congenital recesses, known as post-anal dimples and coccygeal sinuses. These recesses are lined with skin, which is furnished with hairs, sebaceous and sweat glands. If the external orifice becomes occluded, there results a dermoid cyst.

Tubulo-dermoids arise from embryonic ducts and passages that are normally obliterated at birth, for example, lingual dermoids develop in relation to the thyreo-glossal duct; rectal and post-rectal dermoids to the post-anal gut; and branchial dermoids in relation to the branchial clefts. Tubulo-dermoids present the same structure as skin dermoids, save that mucous membrane takes the place of skin in the wall of the cyst, and the contents consist of the pent-up secretion of mucous glands.

Clinical Features.--Although dermoids are of congenital origin, they are rarely evident at birth, and may not give rise to visible tumours until puberty, when the skin and its appendages become more active, or not till adult life. Superficial dermoids, such as those met with at the outer angle of the orbit, form rounded, definitely limited tumours over which the skin is freely movable. They are usually adherent to the deeper parts, and when situated over the skull may be lodged in a depression or actual gap in the bone. Sometimes the cyst becomes infected and suppurates, and finally ruptures on the surface. This may lead to a natural cure, or a persistent sinus may form. Dermoids more deeply placed, such as those within the thorax, or those situated between the rectum and sacrum, give rise to difficulty in diagnosis, even with the help of the X-rays, and their nature is seldom recognised until the escape of the contents--particularly hairs--supplies the clue. The literature of dermoid cysts is full of accounts of puzzling tumours met with in all sorts of situations.

The treatment is to remove the cyst. When it is impossible to remove the whole of the lining membrane by dissection, the portion that is left should be destroyed with the cautery.

Ovarian Dermoids.--Dermoids are not uncommon in the ovary (Fig. 59). They usually take the form of unilocular or multilocular cysts, the wall of which contains skin, mucous membrane, hair follicles, sebaceous, sweat, and mucous glands, nails, teeth, nipples, and mammary glands. The cavity of the cyst usually contains a pultaceous mixture of shed epithelium, fluid fat, and hair. If the cyst ruptures, the epithelial elements are diffused over the peritoneum, and may give rise to secondary dermoids.

[Illustration: FIG. 59.--Dermoid Cyst of Ovary showing Teeth in its interior.]

The ovarian dermoid appears clinically as an abdominal or pelvic tumour provided with a pedicle; if the pedicle becomes twisted, the tumour undergoes strangulation, an event which is attended with urgent symptoms, not unlike those of strangulated hernia.

The treatment consists in removing the tumour by laparotomy.

#Teratoma.#--A teratoma is believed to result from partial dichotomy or cleavage of the trunk axis of the embryo, and is found exclusively in connection with the skull and vertebral column. It may take the form of a monstrosity such as conjoined twins or a parasitic foetus, but more commonly it is met with as an irregularly shaped tumour, usually growing from the sacrum. On dissection, such a tumour is found to contain a curious mixture of tissues--bones, skin, and portions of viscera, such as the intestine or liver. The question of the removal of the tumour requires to be considered in relation to the conditions present in each individual case.

CYSTS[3]

[3] Cysts which form in relation to new-growths have been considered with tumours.

Cysts are rounded sacs, the wall being composed of fibrous tissue lined by epithelium or endothelium; the contents are fluid or semi-solid, and vary in character according to the tissue in which the cyst has originated.

Retention and Exudation Cysts.--Retention cysts_ develop when the duct of a secreting gland is partly obstructed; the secretion accumulates, and the gland and its duct become distended into a cyst. They are met with in the mamma and in the salivary glands. Sebaceous cysts or wens are described with diseases of the skin. _Exudation cysts_ arise from the distension of cavities which are not provided with excretory ducts, such as those in the thyreoid.

Implantation cysts are caused by the accidental transference of portions of the epidermis into the underlying connective tissue, as may occur in wounds by needles, awls, forks, or thorns. The implanted epidermis proliferates and forms a small cyst. They are met with chiefly on the palmar aspect of the fingers, and vary in size from a split pea to a cherry. The treatment consists in removing them by dissection.

Parasitic cysts are produced by the growth within the tissues of cyst-forming parasites, the best known being the taenia echinococcus, which gives rise to the _hydatid cyst_. The liver is by far the most common site of hydatid cysts in the human subject.

With regard to the further life-history of hydatids, the living elements of the cyst may die and degenerate, or the cyst may increase in size until it ruptures. As a result of pyogenic infection the cyst may be converted into an abscess.

The _clinical features_ of hydatids vary so much with their situation and size, that they are best discussed with the individual organs. In general it may be said that there is a slow formation of a globular, elastic, fluctuating, painless swelling. Fluctuation is detected when the cyst approaches the surface, and it is then also that percussion may elicit the "hydatid thrill" or fremitus. This thrill is not often obtainable, and in any case is not pathognomonic of hydatids, as it may be elicited in ascites and in other abdominal cysts. Pressure of the cyst upon adjacent structures, and the occurrence of suppuration, are attended with characteristic clinical features.

The _diagnosis_ of hydatids will be considered with the individual organs. The disease is more common in certain parts of Australia and in Shetland and Iceland than in countries where the association of dogs in the domestic life of the inhabitants is less intimate. Pfeiler, who has

worked at the serum diagnosis of hydatid disease, regards the complement deviation method as the most reliable; he believes that a positive reaction may almost be regarded as absolutely diagnostic of an echinococcal lesion.

The treatment is to excise the cyst completely, or to inject into it a 1 per cent. solution of formalin. In operating upon hydatids the utmost care must be taken to avoid leakage of the contents of the cyst, as these may readily disseminate the infection.

A blood cyst or haematoma results from the encapsulation of extravasated blood in the tissues, from haemorrhage taking place into a preformed cyst, or from the saccular pouching of a varicose vein.

A lymph cyst usually results from a contusion in which the skin is forcibly displaced from the subjacent tissues, and lymph vessels are thereby torn across. The cyst is usually situated between the skin and fascia, and contains clear or blood-stained serum. At first it is lax and fluctuates readily, later it becomes larger and more tense. The treatment consists in drawing off the contents through a hollow needle and applying firm pressure. Apart from injury, lymph cysts are met with as the result of the distension of lymph spaces and vessels (lymphangiectasis); and in lymphangiomas, of which the best-known example is the cystic hygroma or hydrocele of the neck.

GANGLION

This term is applied to a cyst filled with a clear colourless jelly or colloid material, met with in the vicinity of a joint or tendon sheath.

The commonest variety--the carpal ganglion--popularly known as a sprained sinew--is met with as a smooth, rounded, or oval swelling on the dorsal aspect of the carpus, usually towards its radial side (Fig. 60). It is situated over one of the intercarpal or other joints in this region, and may be connected with one or other of the extensor tendons. The skin and fascia are movable over the cyst. The cyst varies in size from a pea to a pigeon's egg, and usually attains its maximum size within a few months and then remains stationary. It becomes tense and prominent when the hand is flexed towards the palm. Its appearance is usually ascribed to some strain of the wrist--for example, in girls learning gymnastics. It may cause no symptoms or it may interfere with the use of the hand, especially in grasping movements and when the hand is dorsiflexed. In girls it may give rise to pain which shoots up the arm. Ganglia are also met with on the dorsum of the metacarpus and on the palmar aspect of the wrist.

[Illustration: FIG. 60.--Carpal Ganglion in a woman aet. 25.]

The tarsal ganglion is situated on the dorsum of the foot over one or other of the intertarsal joints. It is usually smaller, flatter, and more tense than that met with over the wrist, so that it is sometimes mistaken for a bony tumour. It rarely causes symptoms, unless so situated as to be pressed upon by the boot.

Ganglia in the region of the knee are usually situated over the interval between the femur and tibia, most often on the lateral aspect of the joint in front of the tendon of the biceps (Fig. 61). The swelling, which may attain the size of half a walnut, is tense and hard when the knee is extended, and becomes softer and more prominent when it is flexed. They are met with in young adults who follow laborious occupations or who indulge in athletics, and they cause stiffness, discomfort, and impairment of the use of the limb. A ganglion is sometimes met with on the median aspect of the head of the metatarsal bone of the great toe and may be the cause of considerable suffering; it is indistinguishable from the thickened and enlarged bursa so commonly present in this situation in the condition known as bunion.

[Illustration: FIG. 61.--Ganglion on lateral aspect of Knee in a young woman.]

Ganglionic cysts are met with in other situations than those mentioned, but they are so rare as not to require separate description.

Ganglia are to be diagnosed by their situation and physical characters; enlarged bursae, synovial cysts, and new-growths are the swellings most likely to be mistaken for them. The diagnosis is sometimes only cleared up by withdrawing the clear, jelly-like contents through a hollow needle.

Pathological Anatomy.--The wall of the cyst is composed of fibrous tissue closely adherent to or fused with the surrounding tissues, so that it cannot be shelled out. There is no endothelial lining, and the fibrous tissue of the wall is in immediate contact with the colloid material in the interior, which appears to be derived by a process of degeneration from the surrounding connective tissue. In the region of the knee the ganglion is usually multilocular, and consists of a meshwork of fibrous tissue, the meshes of which are occupied by colloid material.

It is often stated that a ganglion originates from a hernial protrusion of the synovial membrane of a joint or tendon sheath. We have not been able to demonstrate any communication between the cavity of the cyst and that of an adjacent tendon sheath or joint. It is possible, however, that the cyst may originate from a minute portion of synovial membrane being protruded and strangulated so that it becomes disconnected from that to which it originally belonged; it may then degenerate and give rise to colloid material, which accumulates and forms a cyst. Ledderhose and others regard ganglia as entirely new formations in the peri-articular tissues, resulting from colloid degeneration of the fibrous tissue of the capsular ligament, occurring at first in numerous small areas which later coalesce. Ganglia are probably, therefore, of the nature of degeneration cysts arising in the capsule of joints, in tendons, and in their sheaths.

Treatment.--A ganglion can usually be got rid of by a modification of the old-fashioned seton. The skin and cyst wall are transfixed by a stout needle carrying a double thread of silkworm gut; some of the colourless jelly escapes from the punctures; the ends of the thread are tied and cut short, and a dressing is applied. A week later the threads are removed and the minute punctures are sealed with collodion. The action of the threads is to convert the cyst wall into granulation tissue, which undergoes the usual conversion into scar tissue. If the cyst re-forms, it should be removed by open dissection under local anaesthesia. Puncture with a tenotomy knife and scraping the interior, and the injection of irritants, are alternative, but less satisfactory, methods of treatment.

Ganglia in the substance of tendons are rare. The diagnosis rests on the observation that the small tumour is cystic, and that it follows the movements of the tendon. The cyst is at first multiple, but the partitions disappear, and the spaces are thrown into one. The tendon is so weakened that it readily ruptures. The best treatment is to resect the affected segment of tendon.

The so-called "compound palmar ganglion" is a tuberculous disease of the tendon sheaths, and is described with diseases of tendon sheaths.

CHAPTER XI

INJURIES

CONTUSIONS--WOUNDS: Varieties--WOUNDS BY FIREARMS AND
EXPLOSIVES: Pistol-shot wounds; Wounds by sporting guns;
Wounds by rifle bullets; Wounds received in warfare; Shell
wounds. Embedded foreign bodies--BURNS AND

SCALDS--INJURIES PRODUCED BY ELECTRICITY: _X-ray and radium_; _Electrical burns_; _Lightning stroke_.

CONTUSIONS

A contusion or bruise is a laceration of the subcutaneous soft tissues, without solution of continuity of the skin. When the integument gives way at the same time, a contused-wound results. Bruising occurs when force is applied to a part by means of a blunt object, whether as a direct blow, a crush, or a grazing form of violence. If the force acts at right angles to the part, it tends to produce localised lesions which extend deeply; while, if it acts obliquely, it gives rise to lesions which are more diffuse, but comparatively superficial. It is well to remember that those who suffer from scurvy, or haemophilia (bleeders), and fat and anaemic females, are liable to be bruised by comparatively trivial injuries.

Clinical Features.--The less severe forms of contusion are associated with ecchymosis, numerous minute and discrete punctate haemorrhages being scattered through the superficial layers of the skin, which is slightly oedematous. The effused blood is soon reabsorbed.

The more severe forms are attended with extravasation, the extravasated blood being widely diffused through the cellular tissue of the part, especially where this is loose and lax, as in the region of the orbit, the scrotum and perineum, and on the chest wall. A blue or bluish-black discolouration occurs in patches, varying in size and depth with the degree of force which produced the injury, and in shape with the instrument employed. It is most intense in regions where the skin is naturally thin and pigmented. In parts where the extravasated blood is only separated from the oxygen of the air by a thin layer of epidermis or by a mucous membrane, it retains its bright arterial colour. These points are often well illustrated in cases of black eye, where the blood effused under the conjunctiva is bright red, while that in the eyelids is almost black. In severe contusions associated with great tension of the skin--for example, over the front of the tibia or around the ankle--blisters often form on the surface and constitute a possible avenue of infection. When deeply situated, the blood tends to spread along the lines of least resistance, partly under the influence of gravity, passing under fasciae, between muscles, along the sheaths of vessels, or in connective-tissue spaces, so that it may only reach the surface after some time, and at a considerable distance from the seat of injury. This fact is sometimes of importance in diagnosis, as, for example, in certain fractures of the base of the skull, where discolouration appears under the conjunctiva or behind the mastoid process some days after the accident.

Blood extravasated deeply in the tissues gives rise to a firm, resistant, doughy swelling, in which there may be elicited on deep palpation a peculiar sensation, not unlike the crepitus of fracture.

It frequently happens that, from the tearing of lymph vessels, serous fluid is extravasated, and a lymphatic or serous cyst may form.

In all contusions accompanied by extravasation, there is marked swelling of the area involved, as well as pain and tenderness. The temperature may rise to 101 ° F., or, in the large extravasations that occur in bleeders, even higher--a form of aseptic fever. The degree of shock is variable, but sudden syncope frequently results from severe bruises of the testicle, abdomen, or head, and occasionally marked nervous depression follows these injuries.

Contusion of muscles or nerves may produce partial atrophy and paresis, as is often seen after injuries in the region of the shoulder.

In alcoholic or other debilitated patients, suppuration is liable to ensue in bruised parts, infection taking place from cocci circulating in the blood, or through the overlying skin.

Terminations of Contusions.--The usual termination is a complete return to the normal, some of the extravasated blood being organised, but most of it being reabsorbed. During the process characteristic alterations in the colour of the effused blood take place as a result of changes in the blood pigment. In from twenty-four to forty-eight hours the margins of the blue area become of a violet hue, and as time goes on the discoloured area increases in size, and becomes successively green, yellow, and lemon-coloured at its margins, the central part being the last to change. The rate at which this play of colours proceeds is so variable, and depends on so many circumstances, that no time-limits can be laid down. During the disintegration of the effused blood the adjacent lymph glands may become enlarged, and on dissection may be found to be pigmented. Sometimes the blood persists as a collection of fluid with a newly formed connective-tissue capsule, constituting a haematoma or blood cyst, more often met with in the scalp than in other parts.

The impairment of the blood supply of the skin may lead to the formation of blisters, or to necrosis. Death of skin is more liable to occur in bleeders, and when the slough separates the blood-clot is exposed and the reparative changes go on extremely slowly. Suppuration may occur and lead to the formation of an abscess as a result of direct infection from the skin or through the circulation.

Treatment.--If the patient is seen immediately after the accident, elevation of the part, and firm pressure applied by means of a thick pad of cotton wool and an elastic bandage, are useful in preventing effusion of blood. Ice-bags and evaporating lotions are to be used with caution, as they are liable to lower the vitality of the damaged tissues and lead to necrosis of the skin.

When extravasation has already taken place, massage is the most speedy and efficacious means of dispersing the effused blood. The part should be massaged several times a day, unless the presence of blebs or abrasions of the skin prevents this being done. When this is the case, the use of antiseptic dressings is called for to prevent infection and to promote healing, after which massage is employed.

When the tension caused by the extravasated blood threatens the vitality of the skin, incisions may be made, if asepsis can be assured. The blood from a haematoma may be withdrawn by an exploring needle, and the puncture sealed with collodion. Infective complications must be looked for and dealt with on general principles.

WOUNDS

A wound is a solution in the continuity of the skin or mucous membrane and of the underlying tissues, caused by violence.

Three varieties of wounds are described: incised, punctured, and contused and lacerated.

#Incised Wounds.--Typical examples of incised wounds are those made by the surgeon in the course of an operation, wounds accidentally inflicted by cutting instruments, and suicidal cut-throat wounds. It should be borne in mind in connection with medico-legal inquiries, that wounds of soft parts that closely overlie a bone, such as the skull, the tibia, or the patella, although, inflicted by a blunt instrument, may have all the appearances of incised wounds.

Clinical Features.--One of the characteristic features of an incised wound is its tendency to gape. This is evident in long skin wounds, and especially when the cut runs across the part, or when it extends deeply enough to divide muscular fibres at right angles to their long axis. The gaping of a wound, further, is more marked when the underlying tissues are in a state of tension--as, for example, in inflamed parts. Incised wounds in the palm of the hand, the sole of the foot, or the scalp, however, have little tendency to gape, because of the close attachment of the skin to the underlying fascia.

Incised wounds, especially in inflamed tissues, tend to bleed profusely; and when a vessel is only partly divided and is therefore unable to contract, it continues to bleed longer than when completely cut across.

The special risks of incised wounds are: (1) division of large blood vessels, leading to profuse haemorrhage; (2) division of nerve-trunks, resulting in motor and sensory disturbances; and (3) division of tendons or muscles, interfering with movement.

Treatment.--If haemorrhage is still going on, it must be arrested by pressure, torsion, or ligature, as the accumulation of blood in a wound interferes with union. If necessary, the wound should be purified by washing with saline solution or eusol, and the surrounding skin painted with iodine, after which the edges are approximated by sutures. The raw surfaces must be brought into accurate apposition, care being taken that no inversion of the cutaneous surface takes place. In extensive and deep wounds, to ensure more complete closure and to prevent subsequent stretching of the scar, it is advisable to unite the different structures--muscles, fasciae, and subcutaneous tissue--by separate series of buried sutures of catgut or other absorbable material. For the approximation of the skin edges, stitches of horse-hair, fishing-gut, or fine silk are the most appropriate. These stitches of coaptation may be interrupted or continuous. In small superficial wounds on exposed parts, stitch marks may be avoided by approximating the edges with strips of gauze fixed in position by collodion, or by subcutaneous sutures of fine catgut. Where the skin is loose, as, for example, in the neck, on the limbs, or in the scrotum, the use of Michel's clips is advantageous in so far as these bring the deep surfaces of the skin into accurate apposition, are introduced with comparatively little pain, and leave only a slight mark if removed within forty-eight hours.

When there is any difficulty in bringing the edges of the wound into apposition, a few interrupted relaxation stitches may be introduced wide of the margins, to take the strain off the coaptation stitches. Stout silk, fishing-gut, or silver wire may be employed for this purpose. When the tension is extreme, Lister's button suture may be employed. The tension is relieved and death of skin prevented by scoring it freely with a sharp knife. Relaxation stitches should be removed in four or five days, and stitches of coaptation in from seven to ten days. On the face and neck, wounds heal rapidly, and stitches may be removed in two or three days, thus diminishing the marks they leave.

Drainage.--In wounds in which no cavity has been left, and in which there is no reason to suspect infection, drainage is unnecessary. When, however, the deeper parts of an extensive wound cannot be brought into accurate apposition, and especially when there is any prospect of oozing of blood or serum--as in amputation stumps or after excision of the breast--drainage is indicated. It is a wise precaution also to insert drainage tubes into wounds in fat patients when there is the slightest reason to suspect the presence of infection. Glass or rubber tubes are the best drains; but where it is desirable to leave little mark, a few strands of horse-hair, or a small roll of rubber, form a satisfactory substitute. Except when infection occurs, the drain is removed in from one to four days and the opening closed with a Michel's clip or a suture.

#Punctured Wounds.--Punctured wounds are produced by narrow, pointed instruments, and the sharper and smoother the instrument the more does the resulting injury resemble an incised wound; while from more rounded and rougher instruments the edges of the wound are more or less contused or lacerated. The depth of punctured wounds greatly exceeds their width, and the damage to subcutaneous parts is usually greater than that to the skin. When the instrument transfixes a part, the edges of the wound of entrance may be inverted, and those of the exit wound everted. If the instrument is a rough one, these conditions may be reversed by its sudden withdrawal.

Punctured wounds neither gape nor bleed much. Even when a large vessel is implicated, the bleeding usually takes place into the tissues rather

than externally.

The risks incident to this class of wounds are: (1) the extreme difficulty, especially when a dense fascia has been perforated, of rendering them aseptic, on account of the uncertainty as to their depth, and of the way in which the surface wound closes on the withdrawal of the instrument; (2) different forms of aneurysm may result from the puncture of a large vessel; (3) perforation of a joint, or of a serous cavity, such as the abdomen, thorax, or skull, materially adds to the danger.

Treatment.--The first indication is to purify the whole extent of the wound, and to remove any foreign body or blood-clot that may be in it. It is usually necessary to enlarge the wound, freely dividing injured fasciae, paring away bruised tissues, and purifying the whole wound-surface. Any blood vessel that is punctured should be cut across and tied; and divided muscles, tendons, or nerves must be sutured. After haemorrhage has been arrested, iodoform and bismuth paste is rubbed into the raw surface, and the wound closed. If there is any reason to doubt the asepticity of the wound, it is better treated by the open method, and a Bier's bandage should be applied.

#Contused and Lacerated Wounds.--These may be considered together, as they so occur in practice. They are produced by crushing, biting, or tearing forms of violence--such as result from machinery accidents, firearms, or the bites of animals. In addition to the irregular wound of the integument, there is always more or less bruising of the parts beneath and around, and the subcutaneous lesions are much wider than appears on the surface.

Wounds of this variety usually gape considerably, especially when there is much laceration of the skin. It is not uncommon to have considerable portions of skin, muscle, or tendon completely torn away.

Haemorrhage is seldom a prominent feature, as the crushing or tearing of the vessel wall leads to the obliteration of the lumen.

The special risks of these wounds are: (1) Sloughing of the bruised tissues, especially when attempts to sterilise the wound have not been successful. (2) Reactionary haemorrhage after the initial shock has passed off. (3) Secondary haemorrhage as a result of infective processes ensuing in the wound. (4) Loss of muscle or tendon, interfering with motion. (5) Cicatricial contraction. (6) Gangrene, which may follow occlusion of main vessels, or virulent infective processes. (7) It is not uncommon to have particles of carbon embedded in the tissues after lacerated wounds, leaving unsightly, pigmented scars. This is often seen in coal-miners, and in those injured by firearms, and is to be prevented by removing all gross dirt from the edges of the wound.

Treatment.--In severe wounds of this class implicating the extremities, the most important question that arises is whether or not the limb can be saved. In examining the limb, attention should first be directed to the state of the main blood vessels, in order to determine if the vascular supply of the part beyond the lesion is sufficient to maintain its vitality. Amputation is usually called for if there is complete absence of pulsation in the distal arteries and if the part beyond is cold. If at the same time important nerve-trunks are lacerated, so that the function of the limb would be seriously impaired, it is not worth running the risk of attempting to save it. If, in addition, there is extensive destruction of large muscular masses or of important tendons, or comminution of the bones, amputation is usually imperative. Stripping of large areas of skin is not in itself a reason for removing a limb, as much can be done by skin grafting, but when it is associated with other lesions it favours amputation. In considering these points, it must be borne in mind that the damage to the deeper tissues is always more extensive than appears on the surface, and that in many cases it is only possible to estimate the real extent of the injury by administering an anaesthetic and exploring the wound. In doubtful cases the possibility of rendering the parts aseptic will often decide the question for or against amputation. If thorough purification

is accomplished, the success which attends conservative measures is often remarkable. It is permissible to run an amount of risk to save an upper extremity which would be unjustifiable in the case of a lower limb. The age and occupation of the patient must also be taken into account.

It having been decided to try and save the limb, the question is only settled for the moment; it may have to be reconsidered from day to day, or even from hour to hour, according to the progress of the case.

When it is decided to make the attempt to save the limb, the wound must be thoroughly purified. All bruised tissue in which gross dirt has become engrained should be cut away with knife or scissors. The raw surface is then cleansed with eusol, washed with sterilised salt solution followed by methylated spirit, and rubbed all over with "bipp" paste. If the purification is considered satisfactory the wound may be closed, otherwise it is left open, freely drained or packed with gauze, and the limb is immobilised by suitable splints.

WOUNDS BY FIREARMS AND EXPLOSIVES

It is not necessary here to do more than indicate the general characters of wounds produced by modern weapons. For further details the reader is referred to works on military surgery. Experience has shown that the nature and severity of the injuries sustained in warfare vary widely in

different campaigns, and even in different fields of the same campaign. Slight variations in the size, shape, and weight of rifle bullets, for example, may profoundly modify the lesions they produce: witness the destructive effect of the pointed bullet compared with that of the conical form previously used. The conditions under which the fighting is carried on also influence the wounds. Those sustained in the open, long-range fighting of the South African campaign of 1899-1902 were very different from those met with in the entrenched warfare in France in 1914-1918. It has been found also that the infective complications are greatly influenced by the terrain in which the fighting takes place. In the dry, sandy, uncultivated veldt of South Africa, bullet wounds seldom became infected, while those sustained in the highly manured fields of Belgium were almost invariably contaminated with putrefactive organisms, and gaseous gangrene and tetanus were common complications. It has been found also that wounds inflicted in naval engagements present different characters from those sustained on land. Many other factors, such as the physical and mental condition of the men, the facilities for affording first aid, and the transport arrangements, also play a part in determining the nature and condition of the wounds that have to be dealt with by military surgeons.

Whatever the nature of the weapon concerned, the wound is of the punctured, contused, and lacerated variety. Its severity depends on the size, shape, and velocity of the missile, the range at which the weapon is discharged, and the part of the body struck.

Shock is a prominent feature, but its degree, as well as the time of its onset, varies with the extent and seat of the injury, and with the mental state of the patient when wounded. We have observed pronounced shock in children after being shot even when no serious injury was sustained. At the moment of injury the patient experiences a sensation which is variously described as being like the lash of a whip, a blow with a stick, or an electric shock. There is not much pain at first, but later it may become severe, and is usually associated with intense thirst, especially when much blood has been lost.

In all forms of wounds sustained in warfare, septic infection constitutes the main risk, particularly that resulting from streptococci. The presence of anaerobic organisms introduces the additional danger of gaseous forms of gangrene.

The earlier the wound is disinfected the greater is the possibility of diminishing this risk. If cleansing is carried out within the first six

hours the chance of eliminating sepsis is good; with every succeeding six hours it diminishes, until after twenty-four hours it is seldom possible to do more than mitigate sepsis. (J. T. Morrison.)

The presence of a metallic foreign body having been determined and its position localised by means of the X-rays, all devitalised and contaminated tissue is excised, the foreign material, _e.g._, a missile, fragments of clothing, gravel and blood-clot, removed, the wound purified with antiseptics and closed or drained according to circumstances.

#Pistol-shot Wounds.--Wounds inflicted by pistols, revolvers, and small air-guns are of frequent occurrence in civil practice, the weapon being discharged usually by accident, but frequently with suicidal, and sometimes with homicidal intent.

With all calibres and at all ranges, except actual contact, the wound of entrance is smaller than the bullet. If the weapon is discharged within a foot of the body, the skin surrounding the wound is usually stained with powder and burned, and the hair singed. At ranges varying from six inches to thirty feet, grains of powder may be found embedded in the skin or lying loose on the surface, the greater the range the wider being the area of spread. When black powder is used, the embedded grains usually leave a permanent bluish-black tattooing of the skin. When the weapon is placed in contact with the skin, the subcutaneous tissues are lacerated over an area of two or three inches around the opening made by the bullet and smoke and powder-staining and scorching are more marked than at longer ranges.

When the bullet perforates, the exit wound is usually larger and more extensively lacerated than the wound of entrance. Its margins are as a rule everted, and it shows no marks of flame, smoke, or powder. These features are common to all perforations caused by bullets.

Pistol wounds only produce dangerous effects when fired at close range, and when the cavities of the skull, the thorax, or the abdomen are implicated. In the abdomen a lethal injury may readily be caused even by pistols of the "toy" order. These injuries will be described with regional surgery.

Pistol-shot wounds of joints and soft parts are seldom of serious import apart from the risk of haemorrhage and of infection.

Treatment.--The treatment of wounds of the soft parts consists in purifying the wounds of entrance and exit and the surrounding skin, and in providing for drainage if this is indicated.

There being no urgency for the removal of the bullet, time should be taken to have it localised by the X-rays, preferably by stereoscopic plates. In some cases it is not necessary to remove the bullet.

#Wounds by Sporting Guns.--In the common sporting or scatter gun, with which accidents so commonly occur during the shooting season, the charge of small shot or pellets leave the muzzle of the gun as a solid mass which makes a single ragged wound having much the appearance of that caused by a single bullet. At a distance of from four to five feet from the muzzle the pellets begin to disperse so that there are separate punctures around the main central wound. As the range increases, these outlying punctures make a wider and wider pattern, until at a distance of from eighteen to twenty feet from the muzzle, the scattering is complete, there is no longer any central wound, and each individual pellet makes its own puncture. From these elementary data, it is usually possible, from the features of the wound, to arrive at an approximately accurate conclusion regarding the range at which the gun was discharged, and this may have an important bearing on the question of accident, suicide, or murder.

As regards the effects on the tissues at close range, that is, within a few feet, there is widespread laceration and disruption; if a bone is struck it is shattered, and portions of bone may be displaced or even

driven out through the exit wound.

When the charge impinges over one of the large cavities of the body, the shot may scatter widely through the contained viscera, and there is often no exit wound. In the thorax, for example, if a rib is struck, the charge and possibly fragments of bone, will penetrate the pleura, and be dispersed throughout the lung; in the head, the skull may be shattered and the brain torn up; and in the abdomen, the hollow viscera may be perforated in many places and the solid organs lacerated.

On covered parts the clothing, by deflecting the shot, influences the size and shape of the wound; the entrance wound is increased in size and more ragged, and portions of the clothes may be driven into the tissues.

[Illustration: FIG. 62.--Radiogram showing Pellets embedded in Arm.

(Mr. J. W. Dowden's case.)]

A charge of small shot is much more destructive to blood vessels, tendons, and ligaments than a single bullet, which in many cases pushes such structures aside without dividing them. In the abdomen and chest, also, the damage done by a full charge of shot is much more extensive than that inflicted by a single bullet, the deflection of the pellets leading to a greater number of perforations of the intestine and more widespread laceration of solid viscera.

When the charge impinges on one of the extremities at close range, we often have the opportunity of observing that the exit wound is larger, more ragged than that of entrance, and that its edges are everted; the extensive tearing and bruising of all the tissues, including the bones, and the marked tendency to early and progressive septic infection, render amputation compulsory in the majority of such cases.

At a range of from twenty to thirty feet, although the scatter is complete, the pellets are still close together, so that if they encounter the shaft of a long bone, even the femur, they fracture the bone across, often along with some longitudinal splintering.

Individual pellets striking the shafts of long bones become flattened or distorted, and when cancellated bone is struck they become embedded in it (Fig. 62).

The skin, when it is closely peppered with shot, is liable to lose its vitality, and with the addition of a little sepsis, readily necroses and comes away as a slough.

When the shot have diverged so as to strike singly, they seldom do much harm, but fatal damage may be done to the brain or to the aorta, or the eye may be seriously injured by a single pellet.

Small shot fired at longer ranges--over about a hundred and fifty feet--usually go through the skin, but seldom pierce the fascia, and lie embedded in the subcutaneous tissue, from which they can readily be extracted.

The wad of the cartridge behaves erratically: so long as it remains flat it goes off with the rest of the charge, and is often buried in the wound; but if it curls up or turns on its side, it is usually deflected and flies clear of the shot. It may make a separate wound.

Wounds from sporting guns are to be treated on the usual lines, the early efforts being directed to the alleviation of shock and the prevention of septic infection. There is rarely any urgency in the removal of pellets from the tissues.

#Wounds by Rifle Bullets.--The vast majority of wounds inflicted by rifle bullets are met with in the field during active warfare, and fall to be treated by military surgeons. They occasionally occur accidentally, however, during range practice for example, and may then come under the notice of the civil surgeon.

It is only necessary here to consider the effects of modern small-bore rifle or machine-gun bullets.

The trajectory is practically flat up to 675 yards. In destructive effect there is not much difference between the various high velocity bullets used in different armies; they will kill up to a distance of two miles. The hard covering is employed to enable the bullet to take the grooves in the rifle, and to prevent it stripping as it passes through the barrel. It also increases the penetrating power of the missile, but diminishes its "stopping" power, unless a vital part or a long bone is struck. By removing the covering from the point of the bullet, as is done in the Dum-Dum bullet, or by splitting the end, the bullet is made to expand or "mushroom" when it strikes the body, and its stopping power is thereby greatly increased, the resulting wound being much more severe. These "soft-nosed" expanding bullets are to be distinguished from "explosive" bullets which contain substances which detonate on impact. High velocity bullets are unlikely to lodge in the body unless spent, or pulled up by a sandbag, or metal buckle on a belt, or a book in the pocket, or the core and the case separating--"stripping" of the bullet. Spent shot may merely cause bruising of the surface, or they may pass through the skin and lodge in the subcutaneous tissue, or may even damage some deeper structure such as a nerve trunk.

A blank cartridge fired at close range may cause a severe wound, and, if charged with black powder, may leave a permanent bluish-black pigmentation of the skin.

The lesions of individual tissues--bones, nerves, blood vessels--are considered with these.

#Treatment of Gunshot Wounds under War Conditions.#--It is only necessary to indicate briefly the method of dealing with gunshot wounds in warfare as practised in the European War.

1. On the Field.--Haemorrhage is arrested in the limbs by an improvised tourniquet; in the head by a pad and bandage; in the thorax or abdomen by packing if necessary, but this should be avoided if possible, as it favours septic infection. If a limb is all but detached it should be completely severed. A full dose of morphin is given hypodermically. The ampoule of iodine carried by the wounded man is broken, and its contents are poured over and around the wound, after which the field dressing is applied. In extensive wounds, the "shell-dressing" carried by the stretcher bearers is preferred. All bandages are applied loosely to allow for subsequent swelling. The fragments of fractured bones are immobilised by some form of emergency splint.

2. At the Advanced Dressing Station, after the patient has had a liberal allowance of warm fluid nourishment, such as soup or tea, a full dose of anti-tetanic serum is injected. The tourniquet is removed and the wound inspected. Urgent amputations are performed. Moribund patients are detained lest they die en route.

3. In the Field Ambulance or Casualty Clearing Station further measures are employed for the relief of shock, and urgent operations are performed, such as amputation for gangrene, tracheotomy for dyspnoea, or laparotomy for perforated or lacerated intestine. In the majority of cases the main object is to guard against infection; the skin is disinfected over a wide area and surrounded with towels; damaged tissue, especially muscle, is removed with the knife or scissors, and foreign bodies are extracted. Torn blood vessels, and, if possible, nerves and tendons are repaired. The wound is then partly closed, provision being made for free drainage, or some special method of irrigation, such as that of Carrel, is adopted. Sometimes the wound is treated with bismuth, iodoform, and paraffin paste (B.I.P.P.) and sutured.

4. In the Base Hospital or Hospital Ship various measures may be called for according to the progress of the wound and the condition of the patient.

#Shell Wounds and Wounds produced by Explosions.--It is convenient to consider together the effects of the bursting of shells fired from heavy ordnance and those resulting in the course of blasting operations from the discharge of dynamite or other explosives, or from the bursting of steam boilers or pipes, the breaking of machinery, and similar accidents met with in civil practice.

Wounds inflicted by shell fragments and shrapnel bullets tend to be extensive in area, and show great contusion, laceration, and destruction of the tissues. The missiles frequently lodge and carry portions of the clothing and, it may be, articles from the man's pocket, with them. Shell wounds are attended with a considerable degree of shock. On account of the wide area of contusion which surrounds the actual wound produced by shell fragments, amputation, when called for, should be performed some distance above the torn tissues, as there is considerable risk of sloughing of the flaps.

Wounds produced by dynamite explosions and the bursting of boilers have the same general characters as shell wounds. Fragments of stone, coal, or metal may lodge in the tissues, and favour the occurrence of infective complications.

All such injuries are to be treated on the general principles governing contused and lacerated wounds.

EMBEDDED FOREIGN BODIES

In the course of many operations foreign substances are introduced into the tissues and intentionally left there, for example, suture and ligature materials, steel or aluminium plates, silver wire or ivory pegs used to secure the fixation of bones, or solid paraffin employed to correct deformities. Other substances, such as gauze, drainage tubes, or metal instruments, may be unintentionally left in a wound.

Foreign bodies may also lodge in accidentally inflicted wounds, for example, bullets, needles, splinters of wood, or fragments of clothing. The needles of hypodermic syringes sometimes break and a portion remains embedded in the tissues. As a result of explosions, particles of carbon, in the form of coal-dust or gunpowder, or portions of shale, may lodge in a wound.

The embedded foreign body at first acts as an irritant, and induces a reaction in the tissues in which it lodges, in the form of hyperaemia, local leucocytosis, proliferation of fibroblasts, and the formation of granulation tissue. The subsequent changes depend upon whether or not the wound is infected with pyogenic bacteria. If it is so infected, suppuration ensues, a sinus forms, and persists until the foreign body is either cast out or removed.

If the wound is aseptic, the fate of the foreign body varies with its character. A substance that is absorbable, such as catgut or fine silk, is surrounded and permeated by the phagocytes, which soften and disintegrate it, the debris being gradually absorbed in much the same manner as a fibrinous exudate. Minute bodies that are not capable of being absorbed, such as particles of carbon, or of pigment used in tattooing, are taken up by the phagocytes, and in course of time removed. Larger bodies, such as needles or bullets, which are not capable of being destroyed by the phagocytes, become encapsulated. In the granulation tissue by which they are surrounded large multinuclear giant-cells appear ("foreign-body giant-cells") and attach themselves to the foreign body, the fibroblasts proliferate and a capsule of scar tissue is eventually formed around the body. The tissues of the capsule may show evidence of iron pigmentation. Sometimes fluid accumulates around a foreign body within its capsule, constituting a cyst.

Substances like paraffin, strands of silk used to bridge a gap in a tendon, or portions of calcined bone, instead of being encapsulated, are gradually permeated and eventually replaced by new connective tissue.

Embedded bodies may remain in the tissues for an indefinite period without giving rise to inconvenience. At any time, however, they may cause trouble, either as a result of infective complications, or by inducing the formation of a mass of inflammatory tissue around them, which may simulate a gumma, a tuberculous focus, or a sarcoma. This latter condition may give rise to difficulties in diagnosis, particularly if there is no history forthcoming of the entrance of the foreign body. The ignorance of patients regarding the possible lodgment in the tissues of a foreign body--even of considerable size--is remarkable. In such cases the X-rays will reveal the presence of the foreign body if it is sufficiently opaque to cast a shadow. The heavy, lead-containing varieties of glass throw very definite shadows little inferior in sharpness and definition to those of metal; almost all the ordinary forms of commercial glass also may be shown up by the X-rays.

Foreign bodies encapsulated in the peritoneal cavity are specially dangerous, as the proximity of the intestine furnishes a constant possibility of infection.

The question of removal of the foreign body must be decided according to the conditions present in individual cases; in searching for a foreign body in the tissues, unless it has been accurately located, a general anaesthetic is to be preferred.

BURNS AND SCALDS

The distinction between a burn which results from the action of dry heat on the tissues of the body and a scald which results from the action of moist heat, has no clinical significance.

In young and debilitated subjects hot poultices may produce injuries of the nature of burns. In old people with enfeebled circulation mere exposure to a strong fire may cause severe degrees of burning, the clothes covering the part being uninjured. This may also occur about the feet, legs, or knees of persons while intoxicated who have fallen asleep before the fire.

The damage done to the tissues by strong caustics, such as fuming nitric acid, sulphuric acid, caustic potash, nitrate of silver, or arsenical paste, presents pathological and clinical features almost identical with those resulting from heat. Electricity and the Rontgen rays also produce lesions of the nature of burns.

Pathology of Burns.--Much discussion has taken place regarding the explanation of the rapidly fatal issue in extensive superficial burns. On post-mortem examination the lesions found in these cases are: (1) general hyperaemia of all the organs of the abdominal, thoracic, and cerebro-spinal cavities; (2) marked leucocytosis, with destruction of red corpuscles, setting free haemoglobin which lodges in the epithelial cells of the tubules of the kidneys; (3) minute thrombi and extravasations throughout the tissues of the body; (4) degeneration of the ganglion cells of the solar plexus; (5) oedema and degeneration of the lymphoid tissue throughout the body; (6) cloudy swelling of the liver and kidneys, and softening and enlargement of the spleen. Bardeen suggests that these morbid phenomena correspond so closely to those met with where the presence of a toxin is known to produce them, that in all probability death is similarly due to the action of some poison produced by the action of heat on the skin and on the proteins of the blood.

#Clinical Features--Local Phenomena.#--The most generally accepted classification of burns is that of Dupuytren, which is based upon the depth of the lesion. Six degrees are thus, recognised: (1) hyperaemia or erythema; (2) vesication; (3) partial destruction of the true skin; (4) total destruction of the true skin; (5) charring of muscles; (6) charring of bones.

It must be observed, however, that burns met with at the bedside always illustrate more than one of these degrees, the deeper forms always being associated with those less deep, and the clinical picture is made up of

the combined characters of all. A burn is classified in terms of its most severe portion. It is also to be remarked that the extent and severity of a burn usually prove to be greater than at first sight appears.

Burns of the first degree are associated with erythema of the skin, due to hyperaemia of its blood vessels, and result from scorching by flame, from contact with solids or fluids below 212° F., or from exposure to the sun's rays. They are characterised clinically by acute pain, redness, transitory swelling from oedema, and subsequent desquamation of the surface layers of the epidermis. A special form of pigmentation of the skin is seen on the front of the legs of women from exposure to the heat of the fire.

Burns of Second Degree--Vesication of the Skin.--These are characterised by the occurrence of vesicles or blisters which are scattered over the hyperaemic area, and contain a clear yellowish or brownish fluid. On removing the raised epidermis, the congested and highly sensitive papillae of the skin are exposed. Unna has found that pyogenic bacteria are invariably present in these blisters. Burns of the second degree leave no scar but frequently a persistent discolouration. In rare instances the burned area becomes the seat of a peculiar overgrowth of fibrous tissue of the nature of keloid (p 401).

Burns of Third Degree--Partial Destruction of the Skin.--The epidermis and papillae are destroyed in patches, leaving hard, dry, and insensitive sloughs of a yellow or black colour. The pain in these burns is intense, but passes off during the first or second day, to return again, however, when, about the end of a week, the sloughs separate and expose the nerve filaments of the underlying skin. Granulations spring up to fill the gap, and are rapidly covered by epithelium, derived partly from the margins and partly from the remains of skin glands which have not been completely destroyed. These latter appear on the surface of the granulations as small bluish islets which gradually increase in size, become of a greyish-white colour, and ultimately blend with one another and with the edges. The resulting cicatrix may be slightly depressed, but otherwise exhibits little tendency to contract and cause deformity.

Burns of Fourth Degree--Total Destruction of the Skin.--These follow the more prolonged action of any form of intense heat. Large, black, dry eschars are formed, surrounded by a zone of intense congestion. Pain is less severe, and is referred to the parts that have been burned to a less degree. Infection is liable to occur and to lead to wide destruction of the surrounding skin. The amount of granulation tissue necessary to fill the gap is therefore great; and as the epithelial covering can only be derived from the margins--the skin glands being completely destroyed--the healing process is slow. The resulting scars are irregular, deep and puckered, and show a great tendency to contract. Keloid frequently develops in such cicatrices. When situated in the region of the face, neck, or flexures of joints, much deformity and impairment of function may result (Fig. 63).

[Illustration: FIG. 63.--Cicatricial Contraction following Severe Burn.]

In burns of the fifth degree the lesion extends through the subcutaneous tissue and involves the muscles; while in those of the sixth degree it passes still more deeply and implicates the bones. These burns are comparatively limited in area, as they are usually produced by prolonged contact with hot metal or caustics. Burns of the fifth and sixth degrees are met with in epileptics or intoxicated persons who fall into the fire. Large blood vessels, nerve-trunks, joints, or serous cavities may be implicated.

#General Phenomena.#--It is customary to divide the clinical history of a severe burn into three periods; but it is to be observed that the features characteristic of the periods have been greatly modified since burns have been treated on the same lines as other wounds.

The first period lasts for from thirty-six to forty-eight hours, during which time the patient remains in a more or less profound state

of shock, and there is a remarkable absence of pain. When shock is absent or little marked, however, the amount of suffering may be great. When the injury proves fatal during this period, death is due to shock, probably aggravated by the absorption of poisonous substances produced in the burned tissues. In fatal cases there is often evidence of cerebral congestion and oedema.

The second period begins when the shock passes off, and lasts till the sloughs separate. The outstanding feature of this period is toxaemia, manifested by fever, the temperature rising to 102°, 103°, or 104° F., and congestive or inflammatory conditions of internal organs, giving rise to such clinical complications as bronchitis, broncho-pneumonia, or pleurisy--especially in burns of the thorax; or meningitis and cerebritis, when the neck or head is the seat of the burn. Intestinal catarrh associated with diarrhoea is not uncommon; and ulceration of the duodenum leading to perforation has been met with in a few cases. These phenomena are much more prominent when bacterial infection has taken place, and it seems probable that they are to be attributed chiefly to the infection, as they have become less frequent and less severe since burns have been treated like other breaches of the surface. Albuminuria is a fairly constant symptom in severe burns, and is associated with congestion of the kidneys. In burns implicating the face, neck, mouth, or pharynx, oedema of the glottis is a dangerous complication, entailing as it does the risk of suffocation.

The third period begins when the sloughs separate, usually between the seventh and fourteenth days, and lasts till the wound heals, its duration depending upon the size, depth, and asepticity of the raw area. The chief causes of death during this period are toxin absorption in any of its forms; waxy disease of the liver, kidneys, or intestine; less commonly erysipelas, tetanus, or other diseases due to infection by specific organisms. We have seen nothing to substantiate the belief that duodenal ulcers are liable to perforate during the third period.

The prognosis in burns depends on (1) the superficial extent, and, to a much less degree, the depth of the injury. When more than one-third of the entire surface of the body is involved, even in a mild degree, the prognosis is grave. (2) The situation of the burn is important. Burns over the serous cavities--abdomen, thorax, or skull--are, other things being equal, much more dangerous than burns of the limbs. The risk of oedema of the glottis in burns about the neck and mouth has already been referred to. (3) Children are more liable to succumb to shock during the early period, but withstand prolonged suppuration better than adults. (4) When the patient survives the shock, the presence or absence of infection is the all-important factor in prognosis.

#Treatment.--The general treatment consists in combating the shock. When pain is severe, morphin must be injected.

Local Treatment.--The local treatment must be carried out on antiseptic lines, a general anaesthetic being administered, if necessary, to enable the purification to be carried out thoroughly. After carefully removing the clothing, the whole of the burned area is gently, but thoroughly, cleansed with peroxide of hydrogen or warm boracic lotion, followed by sterilised saline solution. As pyogenic bacteria are invariably found in the blisters of burns, these must be opened and the raised epithelium removed.

The dressings subsequently applied should meet the following indications: the relief of pain; the prevention of sepsis; and the promotion of cicatrisation.

An application which satisfactorily fulfils these requirements is picric acid. Pads of lint or gauze are lightly wrung out of a solution made up of picric acid, 1 1/2 drams; absolute alcohol, 3 ounces; distilled water, 40 ounces, and applied over the whole of the reddened area. These are covered with antiseptic wool, without any waterproof covering, and retained in position by a many-tailed bandage. The dressing should be changed once or twice a week, under the guidance of the temperature chart, any portion of the original dressing which

remains perfectly dry being left undisturbed. The value of a general anaesthetic in dressing extensive burns, especially in children, can scarcely be overestimated.

Picric acid yields its best results in superficial burns, and it is useful as a primary dressing in all. As soon as the sloughs separate and a granulating surface forms, the ordinary treatment for a healing sore is instituted. Any slough under which pus has collected should be cut away with scissors to permit of free drainage.

An occlusive dressing of melted paraffin has also been employed. A useful preparation consists of: Paraffin molle 25 per cent., paraffin durum 67 per cent., olive oil 5 per cent., oil of eucalyptus 2 per cent., and beta-naphthol 1/4 per cent. It has a melting point of 48 o C. It is also known as Ambrine and Burnol. After the burned area has been cleansed and thoroughly dried, it is sponged or painted with the melted paraffin, and before solidification takes place a layer of sterilised gauze is applied and covered with a second coating of paraffin. Further coats of paraffin are applied every other day to prevent the gauze sticking to the skin.

An alternative method of treating extensive burns is by immersing the part, or even the whole body when the trunk is affected, in a bath of boracic lotion kept at the body temperature, the lotion being frequently renewed.

If a burn is already infected when first seen, it is to be treated on the same principles as govern the treatment of other infected wounds.

All moist or greasy applications, such as Carron oil, carbolic oil and ointments, and all substances like collodion and dry powders, which retain discharges, entirely fail to meet the indications for the rational treatment of burns, and should be abandoned.

Skin-grafting is of great value in hastening healing after extensive burns, and in preventing cicatricial contraction. The deformities which are so liable to develop from contraction of the cicatrices are treated on general principles. In the region of the face, neck, and flexures of joints (Fig. 63), where they are most marked, the contracted bands may be divided and the parts stretched, the raw surface left being covered by Thiersch grafts or by flaps of skin raised from adjacent surfaces or from other parts of the body (Fig. 1).

INJURIES PRODUCED BY ELECTRICITY

#Injuries produced by Exposure to X-Rays and Radium.#- In the routine treatment of disease by radiations, injury is sometimes done to the tissues, even when the greatest care is exercised as to dosage and frequency of application. Robert Knox describes the following ill-effects.

Acute dermatitis varying in degree from a slight erythema to deep ulceration or even necrosis of skin. When ulcers form they are extremely painful and slow to heal. When hair-bearing areas are affected, epilation may occur without destroying the hair follicles and the hairs are reproduced, but if the reaction is excessive permanent alopecia may result.

Chronic dermatitis, which results from persistence of the acute form, is most intractable and may assume malignant characters. X-ray warts are a late manifestation of chronic dermatitis and may become malignant.

Among the late manifestations are neuritis, telangiectasis, and a painful and intractable form of ulceration, any of which may come on months or even years after the cessation of exposure. Sterility may be induced in X-ray workers who are imperfectly protected from the effects of the rays.

#Electrical burns# usually occur in those who are engaged in industrial

undertakings where powerful electrical currents are employed.

The lesions--which vary from a slight superficial scorching to complete charring of parts--are most evident at the points of entrance and exit of the current, the intervening tissues apparently escaping injury.

The more superficial degrees of electrical burns differ from those produced by heat in being almost painless, and in healing very slowly, although as a rule they remain dry and aseptic.

The more severe forms are attended with a considerable degree of shock, which is not only more profound, but also lasts much longer than the shock in an ordinary burn of corresponding severity. The parts at the point of entrance of the current are charred to a greater or lesser depth. The eschar is at first dry and crisp, and is surrounded by a zone of pallor. For the first thirty-six to forty-eight hours there is comparatively little suffering, but at the end of that time the parts become exceedingly painful. In a majority of cases, in spite of careful purification, a slow form of moist gangrene sets in, and the slough spreads both in area and in depth, until the muscles and often the large blood vessels and nerves are exposed. A line of demarcation eventually forms, but the sloughs are exceedingly slow to separate, taking from three to five times as long as in an ordinary burn, and during the process of separation there is considerable risk of secondary haemorrhage from erosion of large vessels.

Treatment.--Electrical burns are treated on the same lines as ordinary burns, by thorough purification and the application of dry dressings, with a view to avoiding the onset of moist gangrene. After granulations have formed, skin-grafting is of value in hastening healing.

#Lightning-stroke.#--In a large proportion of cases lightning-stroke proves instantly fatal. In non-fatal cases the patient suffers from a profound degree of shock, and there may or may not be any external evidence of injury. In the mildest cases red spots or wheals--closely resembling those of urticaria--may appear on the body, but they usually fade again in the course of twenty-four hours. Sometimes large patches of skin are scorched or stained, the discoloured area showing an arborescent appearance. In other cases the injured skin becomes dry and glazed, resembling parchment. Appearances are occasionally met with corresponding to those of a superficial burn produced by heat. The chief difference from ordinary burns is the extreme slowness with which healing takes place. Localised paralysis of groups of muscles, or even of a whole limb, may follow any degree of lightning-stroke. Treatment is mainly directed towards combating the shock, the surface-lesions being treated on the same lines as ordinary burns.

CHAPTER XII

METHODS OF WOUND TREATMENT

Varieties of wounds--Modes of infection--Lister's work--Means taken to prevent infection of wounds: heat; chemical antiseptics; disinfection of hands; preparation of skin of patient; instruments; ligatures; dressings--Means taken to combat infection: purification; open-wound method.

The surgeon is called upon to treat two distinct classes of wounds: (1) those resulting from injury or disease in which the skin is already broken, or in which a communication with a mucous surface exists; and (2) those that he himself makes through intact skin, no infected mucous surface being involved.

Infection by bacteria must be assumed to have taken place in all wounds made in any other way than by the knife of the surgeon operating through unbroken skin. On this assumption the modern system of wound treatment

is based. Pathogenic bacteria are so widely distributed, that in the ordinary circumstances of everyday life, no matter how trivial a wound may be, or how short a time it may remain exposed, the access of organisms to it is almost certain unless preventive measures are employed.

It cannot be emphasised too strongly that rigid precautions are to be taken to exclude fresh infection, not only in dealing with wounds that are free of organisms, but equally in the management of wounds and other lesions that are already infected. Any laxity in our methods which admits of fresh organisms reaching an infected wound adds materially to the severity of the infective process and consequently to the patient's risk.

There are many ways in which accidental infection may occur. Take, for example, the case of a person who receives a cut on the face by being knocked down in a carriage accident on the street. Organisms may be introduced to such a wound from the shaft or wheel by which he was struck, from the ground on which he lay, from any portion of his clothing that may have come in contact with the wound, or from his own skin. Or, again, the hands of those who render first aid, the water used to bathe the wound, the handkerchief or other extemporised dressing applied to it, may be the means of conveying bacterial infection. Should the wound open on a mucous surface, such as the mouth or nasal cavity, the organisms constantly present in such situations are liable to prove agents of infection.

Even after the patient has come under professional care the risks of his wound becoming infected are not past, because the hands of the doctor, his instruments, dressings, or other appliances may all, unless purified, become the sources of infection.

In the case of an operation carried out through unbroken skin, organisms may be introduced into the wound from the patient's own skin, from the hands of the surgeon or his assistants, through the medium of contaminated instruments, swabs, ligature or suture materials, or other things used in the course of the operation, or from the dressings applied to the wound.

Further, bacteria may gain access to devitalised tissues by way of the blood-stream, being carried hither from some infected area elsewhere in the body.

The Antiseptic System of Surgery.--Those who only know the surgical conditions of to-day can scarcely realise the state of matters which existed before the introduction of the antiseptic system by Joseph Lister in 1867. In those days few wounds escaped the ravages of pyogenic and other bacteria, with the result that suppuration ensued after most operations, and such diseases as erysipelas, pyaemia, and "hospital gangrene" were of everyday occurrence. The mortality after compound fractures, amputations, and many other operations was appalling, and death from blood-poisoning frequently followed even the most trivial operations. An operation was looked upon as a last resource, and the inherent risk from blood-poisoning seemed to have set an impassable barrier to the further progress of surgery. To the genius of Lister we owe it that this barrier was removed. Having satisfied himself that the septic process was due to bacterial infection, he devised a means of preventing the access of organisms to wounds or of counteracting their effects. Carbolic acid was the first antiseptic agent he employed, and by its use in compound fractures he soon obtained results such as had never before been attained. The principle was applied to other conditions with like success, and so profoundly has it affected the whole aspect of surgical pathology, that many of the infective diseases with which surgeons formerly had to deal are now all but unknown. The broad principles upon which Lister founded his system remain unchanged, although the methods employed to put them into practice have been modified.

#Means taken to Prevent Infection of Wounds.#--The avenues by which infective agents may gain access to surgical wounds are so numerous and

so wide, that it requires the greatest care and the most watchful attention on the part of the surgeon to guard them all. It is only by constant practice and patient attention to technical details in the operating room and at the bedside, that the carrying out of surgical manipulations in such a way as to avoid bacterial infection will become an instinctive act and a second nature. It is only possible here to indicate the chief directions in which danger lies, and to describe the means most generally adopted to avoid it.

To prevent infection, it is essential that everything which comes into contact with a wound should be sterilised or disinfected, and to ensure the best results it is necessary that the efficiency of our methods of sterilisation should be periodically tested. The two chief agencies at our disposal are heat and chemical antiseptics.

#Sterilisation by Heat.--The most reliable, and at the same time the most convenient and generally applicable, means of sterilisation is by heat. All bacteria and spores are completely destroyed by being subjected for fifteen minutes to saturated circulating steam at a temperature of 130° to 145° C. (= 266° to 293° F.). The articles to be sterilised are enclosed in a perforated tin casket, which is placed in a specially constructed steriliser, such as that of Schimmelbusch. This apparatus is so arranged that the steam circulates under a pressure of from two to three atmospheres, and permeates everything contained in it. Objects so sterilised are dry when removed from the steriliser. This method is specially suitable for appliances which are not damaged by steam, such, for example, as gauze swabs, towels, aprons, gloves, and metal instruments; it is essential that the efficiency of the steriliser be tested from time to time by a self-registering thermometer or other means.

The best substitute for circulating steam is boiling. The articles are placed in a "fish-kettle steriliser" and boiled for fifteen minutes in a 1 per cent. solution of washing soda.

To prevent contamination of objects that have been sterilised they must on no account be touched by any one whose hands have not been disinfected and protected by sterilised gloves.

#Sterilisation by Chemical Agents.--For the purification of the skin of the patient, the hands of the surgeon, and knives and other instruments that are damaged by heat, recourse must be had to chemical agents. These, however, are less reliable than heat, and are open to certain other objections.

#Disinfection of the Hands.--It is now generally recognised that one of the most likely sources of wound infection is the hands of the surgeon and his assistants. It is only by carefully studying to avoid all contact with infective matter that the hands can be kept surgically pure, and that this source of wound infection can be reduced to a minimum. The risk of infection from this source has further been greatly reduced by the systematic use of rubber gloves by house-surgeons, dressers, and nurses. The habitual use of gloves has also been adopted by the great majority of surgeons; the minority, who find they are handicapped by wearing gloves as a routine measure, are obliged to do so when operating in infective cases or dressing infected wounds, and in making rectal and vaginal examinations.

The gloves may be sterilised by steam, and are then put on dry, or by boiling, in which case they are put on wet. The gauntlet of the glove should overlap and confine the end of the sleeve of the sterilised overall, and the gloved hands are rinsed in lotion before and at frequent intervals during the operation. The hands are sterilised before putting on the gloves, preferably by a method which dehydrates the skin. Cotton gloves may be worn by the surgeon when tying ligatures, or between operations, and by the anaesthetist during operations on the head, neck, and chest.

The first step in the disinfection of the hands is the mechanical removal of gross surface dirt and loose epithelium by soap, a stream of

running water as hot as can be borne, and a loofah or nail-brush, that has been previously sterilised by heat. The nails should be cut down till there is no sulcus between the nail edge and the pulp of the finger in which organisms may lodge. They are next washed for three minutes in methylated spirit to dehydrate the skin, and then for two or three minutes in 70 per cent. sublimate or biniodide alcohol (1 in 1000). Finally, the hands are rubbed with dry sterilised gauze.

#Preparation of the Skin of the Patient.#--In the purification of the skin of the patient before operation, reliance is to be placed chiefly in the mechanical removal of dirt and grease by the same means as are taken for the cleansing of the surgeon's hands. Hair-covered parts should be shaved. The skin is then dehydrated by washing with methylated spirit, followed by 70 per cent. sublimate or biniodide alcohol (1 in 1000). This is done some hours before the operation, and the part is then covered with pads of dry sterilised gauze or a sterilised towel. Immediately before the operation the skin is again purified in the same way.

The iodine method of disinfecting the skin introduced by Grossich is simple, and equally efficient. The day before operation the skin, after being washed with soap and water, is shaved, dehydrated by means of methylated spirit, and then painted with a 5 per cent. solution of iodine in rectified spirit. The painting with iodine is repeated just before the operation commences, and again after it is completed. The final application is omitted in the case of children. In emergency operations the skin is shaved dry and dehydrated with spirit, after which the iodine is applied as described above. The staining of the skin is an advantage, as it enables the operator to recognise the area that has been prepared.

If any acne pustules or infected sinuses are present, they should be destroyed or purified by means of the thermo-cautery or pure carbolic acid, after the patient is anaesthetised.

#Appliances used at Operation.#--Instruments that are not damaged by heat must be boiled in a fish-kettle or other suitable steriliser for fifteen minutes in a 1 per cent. solution of cresol or washing soda. Just before the operation begins they are removed in the tray of the steriliser and placed on a sterilised towel within reach of the surgeon or his assistant. Knives and instruments that are liable to be damaged by heat should be purified by being soaked in pure cresol for a few minutes, or in 1 in 20 carbolic for at least an hour.

Pads of Gauze sterilised by compressed circulating steam have almost entirely superseded marine sponges for operative purposes. To avoid the risk of leaving swabs in the peritoneal cavity, large square pads of gauze, to one corner of which a piece of strong tape about a foot long is securely stitched, should be employed. They should be removed from the caskets in which they are sterilised by means of sterilised forceps, and handed direct to the surgeon. The assistant who attends to the swabs should wear sterilised gloves.

Ligatures and Sutures.--To avoid the risk of implanting infective matter in a wound by means of the materials used for ligatures and sutures, great care must be taken in their preparation.

Catgut.--The following methods of preparing catgut have proved satisfactory: (1) The gut is soaked in juniper oil for at least a month; the juniper oil is then removed by ether and alcohol, and the gut preserved in 1 in 1000 solution of corrosive sublimate in alcohol (Kocher). (2) The gut is placed in a brass receiver and boiled for three-quarters of an hour in a solution consisting of 85 per cent. absolute alcohol, 10 per cent. water, and 5 per cent. carbolic acid, and is then stored in 90 per cent. alcohol. (3) Cladius recommends that the catgut, just as it is bought from the dealers, be loosely rolled on a spool, and then immersed in a solution of--iodine, 1 part; iodide of potassium, 1 part; distilled water, 100 parts. At the end of eight days it is ready for use. Moschcowitz has found that the tensile strength of catgut so prepared is increased if it is kept dry in a sterile vessel,

instead of being left indefinitely in the iodine solution. If Salkindsohn's formula is used--tincture of iodine, 1 part; proof spirit, 15 parts--the gut can be kept permanently in the solution without becoming brittle. To avoid contamination from the hands, catgut should be removed from the bottle with aseptic forceps and passed direct to the surgeon. Any portion unused should be thrown away.

Silk_ is prepared by being soaked for twelve hours in ether, for other twelve in alcohol, and then boiled for ten minutes in 1 in 1000 sublimate solution. It is then wound on spools with purified hands protected by sterilised gloves, and kept in absolute alcohol. Before an operation the silk is again boiled for ten minutes in the same solution, and is used directly from this (Kocher). Linen thread is sterilised in the same way as silk.

Fishing-gut and silver wire, as well as the needles, should be boiled along with the instruments. Horse-hair and fishing-gut may be sterilised by prolonged immersion in 1 in 20 carbolic, or in the iodine solutions employed to sterilise catgut.

The field of operation is surrounded by sterilised towels, clipped to the edges of the wound, and securely fixed in position so that no contamination may take place from the surroundings.

The surgeon and his assistants, including the anaesthetist, wear overalls sterilised by steam. To avoid the risk of infection from dust, scurf, or drops of perspiration falling from the head, the surgeon and his assistants may wear sterilised cotton caps. To obviate the risk of infection taking place by drops of saliva projected from the mouth in talking or coughing in the vicinity of a wound, a simple mask may be worn.

The risk of infection from the air_ is now known to be very small, so long as there is no excess of floating dust. All sweeping, dusting, and disturbing of curtains, blinds, or furniture must therefore be avoided before or during an operation.

It has been shown that the presence of spectators increases the number of organisms in the atmosphere. In teaching clinics, therefore, the risk from air infection is greater than in private practice.

To facilitate primary union, all haemorrhage should be arrested, and the accumulation of fluid in the wound prevented. When much oozing is anticipated, a glass or rubber drainage-tube is inserted through a small opening specially made for the purpose. In aseptic wounds the tube may be removed in from twenty-four to forty-eight hours, and where it is important to avoid a scar, the opening should be closed with a Michel's clip; in infected wounds the tube must remain as long as the discharge continues.

The fascia and skin should be brought into accurate apposition by sutures. If any cavity exists in the deeper part of the wound it should be obliterated by buried sutures, or by so adjusting the dressing as to bring its walls into apposition.

If these precautions have been successful, the wound will heal under the original dressing, which need not be interfered with for from seven to ten days, according to the nature of the case.

#Dressings.#--Gauze_ is almost universally employed for the dressing of wounds. Double cyanide gauze_ may be used in such regions as the neck, axilla, or groin, where complete sterilisation of the skin is difficult to attain, and where it is desirable to leave the dressing undisturbed for ten days or more.

Iodoform_ or bismuth gauze_ is of special value for the packing of wounds treated by the open method.

One variety or another of wool_ rendered absorbent by the extraction of its fat, and sterilised by heat, forms a part of almost every surgical dressing, and various antiseptic agents may be added to it. Of

these, corrosive sublimate is the most generally used. Wood-wool dressings are more highly and more uniformly absorbent than cotton woools. As evaporation takes place through wool dressings, the discharge becomes dried, and so forms an unfavourable medium for bacterial growth.

Pads of sphagnum moss, sterilised by heat, are highly absorbent, and being economical are used when there is much discharge, and in cases where a leakage of urine has to be soaked up.

#Means adopted to combat Infection.--As has already been indicated, the same antiseptic precautions are to be taken in dealing with infected as with aseptic wounds.

In recent injuries such as result from railway or machinery accidents, with bruising and crushing of the tissues and grinding of gross dirt into the wounds, the scissors must be freely used to remove the tissues that have been devitalised or impregnated with foreign material. Hair-covered parts should be shaved and the surrounding skin painted with iodine. Crushed and contaminated portions of bone should be chiselled away. Opinions differ as to the benefit derived from washing such wounds with chemical antiseptics, which are liable to devitalise the tissues with which they come in contact, and so render them less able to resist the action of any organisms that may remain in them. All are agreed, however, that free washing with normal salt solution is useful in mechanically cleansing the injured parts. Peroxide of hydrogen sprayed over such wounds is also beneficial in virtue of its oxidising properties. Efficient drainage must be provided, and stitches should be used sparingly, if at all.

The best way in which to treat such wounds is by the open method. This consists in packing the wound with iodoform or bismuth gauze, which is left in position as long as it adheres to the raw surface. The packing may be renewed at intervals until the wound is filled by granulations; or, in the course of a few days when it becomes evident that the infection has been overcome, secondary sutures may be introduced and the edges drawn together, provision being made at the ends for further packing or for drainage-tubes.

If earth or street dirt has entered the wound, the surface may with advantage be painted over with pure carbolic acid, as virulent organisms, such as those of tetanus or spreading gangrene, are liable to be present. Prophylactic injection of tetanus antitoxin may be indicated.

CHAPTER XIII

CONSTITUTIONAL EFFECTS OF INJURIES

SYNCOPE--SHOCK--COLLAPSE--FAT EMBOLISM--TRAUMATIC ASPHYXIA--DELIRIUM
IN SURGICAL PATIENTS: Delirium in general; Delirium tremens;
Traumatic delirium.

SYNCOPE, SHOCK, AND COLLAPSE

Syncope, shock, and collapse are clinical conditions which, although depending on different causes, bear a superficial resemblance to one another.

#Syncope or Fainting.--Syncope is the result of a suddenly produced anaemia of the brain from temporary weakening or arrest of the heart's action. In surgical practice, this condition is usually observed in nervous persons who have been subjected to pain, as in the reduction of a dislocation or the incision of a whitlow; or in those who have rapidly lost a considerable quantity of blood. It may also follow the sudden withdrawal of fluid from a large cavity, as in tapping an abdomen for

ascites, or withdrawing fluid from the pleural cavity. Syncope sometimes occurs also during the administration of a general anaesthetic, especially if there is a tendency to sickness and the patient is not completely under. During an operation the onset of syncope is often recognised by the cessation of oozing from the divided vessels before the general symptoms become manifest.

Clinical Features.--When a person is about to faint he feels giddy, has surging sounds in his ears, and haziness of vision; he yawns, becomes pale and sick, and a free flow of saliva takes place into the mouth. The pupils dilate; the pulse becomes small and almost imperceptible; the respirations shallow and hurried; consciousness gradually fades away, and he falls in a heap on the floor.

Sometimes vomiting ensues before the patient completely loses consciousness, and the muscular exertion entailed may ward off the actual faint. This is frequently seen in threatened syncopal attacks during chloroform administration.

Recovery begins in a few seconds, the patient sighing or gasping, or, it may be, vomiting; the strength of the pulse gradually increases, and consciousness slowly returns. In some cases, however, syncope is fatal.

Treatment.--The head should at once be lowered--in imitation of nature's method--to encourage the flow of blood to the brain, the patient, if necessary, being held up by the heels. All tight clothing, especially round the neck or chest, must be loosened. The heart may be stimulated reflexly by dashing cold water over the face or chest, or by rubbing the face vigorously with a rough towel. The application of volatile substances, such as ammonia or smelling-salts, to the nose; the administration by the mouth of sal-volatile, whisky or brandy, and the intra-muscular injection of ether, are the most speedily efficacious remedies. In severe cases the application of hot cloths over the heart, or of the faradic current over the line of the phrenic nerve, just above the clavicle, may be called for.

#Surgical Shock.--The condition known as surgical shock may be looked upon as a state of profound exhaustion of the mechanism that exists in the body for the transformation of energy. This mechanism consists of (1) the brain, which, through certain special centres, regulates all vital activity; (2) the adrenal glands, the secretion of which--adrenalin--acting as a stimulant of the sympathetic system, so controls the tone of the blood vessels as to maintain efficient oxidation of the tissues; and (3) the liver, which stores and delivers glycogen as it is required by the muscles, and in addition, deals with the by-products of metabolism.

Crile and his co-workers have shown that in surgical shock histological changes occur in the cells of the brain, the adrenals, and the liver, and that these are identical, whatever be the cause that leads to the exhaustion of the energy-transforming mechanism. These changes vary in degree, and range from slight alterations in the structure of the protoplasm to complete disorganisation of the cell elements.

The influences which contribute to bring about this form of exhaustion that we call shock are varied, and include such emotional states as fear, anxiety, or worry, physical injury and toxic infection, and the effects of these factors are augmented by anything that tends to lower the vitality, such as loss of blood, exposure, insufficient food, loss of sleep or antecedent illness.

Any one or any combination of these influences may cause shock, but the most potent, and the one which most concerns the surgeon, is physical injury, e.g., a severe accident or an operation (traumatic shock). This is usually associated with some emotional disturbance, such as fear or anxiety (emotional shock), or with haemorrhage; and may be followed by septic infection (toxic shock).

The exaggerated afferent impulses reaching the brain as a result of trauma, inhibit the action of the nuclei in the region of the fourth

ventricle and cerebellum which maintain the muscular tone, with the result that the muscular tone is diminished and there is a marked fall in the arterial blood pressure. The capillaries dilate--the blood stagnating in them and giving off its oxygen and transuding its fluid elements into the tissues--with the result that an insufficient quantity of oxygenated blood reaches the heart to enable it to maintain an efficient circulation. As the sacer-lactic acid liberated in the muscles is not oxygenated a condition of acidosis ensues.

The more highly the injured part is endowed with sensory nerves the more marked is the shock; a crush of the hand, for example, is attended with a more intense degree of shock than a correspondingly severe crush of the foot; and injuries of such specially innervated parts as the testis, the urethra, the face, or the spinal cord, are associated with severe degrees, as are also those of parts innervated from the sympathetic system, such as the abdominal or thoracic viscera. It is to be borne in mind that a state of general anaesthesia does not prevent injurious impulses reaching the brain and causing shock during an operation. If the main nerves of the part are "blocked" by injection of a local anaesthetic, however, the central nervous system is protected from these impulses.

While the aged frequently manifest but few signs of shock, they have a correspondingly feeble power of recovery; and while many young children suffer little, even after severe operations, others with much less cause succumb to shock.

When the injured person's mind is absorbed with other matters than his own condition,--as, for example, during the heat of a battle or in the excitement of a railway accident or a conflagration,--even severe injuries may be unattended by pain or shock at the time, although when the period of excitement is over, the severity of the shock is all the greater. The same thing is observed in persons injured while under the influence of alcohol.

Clinical Features.--The patient is in a state of prostration. He is roused from his condition of indifference with difficulty, but answers questions intelligently, if only in a whisper. The face is pale, beads of sweat stand out on the brow, the features are drawn, the eyes sunken, and the cheeks hollow. The lips and ears are pallid; the skin of the body of a greyish colour, cold, and clammy. The pulse is rapid, fluttering, and often all but imperceptible at the wrist; the respiration is irregular, shallow, and sighing; and the temperature may fall to 96° F. or even lower. The mouth is parched, and the patient complains of thirst. There is little sensibility to pain.

Except in very severe cases, shock tends towards recovery within a few hours, the reaction, as it is called, being often ushered in by vomiting. The colour improves; the pulse becomes full and bounding; the respiration deeper and more regular; the temperature rises to 100° F. or higher; and the patient begins to take notice of his surroundings. The condition of neurasthenia which sometimes follows an operation may be associated with the degenerative changes in nerve cells described by Crile.

In certain cases the symptoms of traumatic shock blend with those resulting from toxin absorption, and it is difficult to estimate the relative importance of the two factors in the causation of the condition. The conditions formerly known as "delayed shock" and "prostration with excitement" are now generally recognised to be due to toxæmia.

Question of Operating during Shock.--Most authorities agree that operations should only be undertaken during profound shock when they are imperatively demanded for the arrest of haemorrhage, the prevention of infection of serous cavities, or for the relief of pain which is producing or intensifying the condition.

Prevention of Operation Shock.--In the preparation of a patient for operation, drastic purgation and prolonged fasting must be avoided, and

about half an hour before a severe operation a pint of saline solution should be slowly introduced into the rectum; this is repeated, if necessary, during the operation, and at its conclusion. The operating-room must be warm--not less than 70° F.--and the patient should be wrapped in cotton wool and blankets, and surrounded by hot-bottles. All lotions used must be warm (100° F.); and the operation should be completed as speedily and as bloodlessly as possible. The element of fear may to some extent be eliminated by the preliminary administration of such drugs as scopolamin or morphin, and with a view to preventing the passage of exciting afferent impulses, Crile advocates "blocking" of the nerves by the injection of a 1 per cent. solution of novocaine into their substance on the proximal side of the field of operation. To prevent after-pain in abdominal wounds he recommends injecting the edges with quinine and urea hydrochlorate before suturing, the resulting anaesthesia lasting for twenty-four to forty-eight hours. To these preventive measures the term anoci-association has been applied. In selecting an anaesthetic, it may be borne in mind that chloroform lowers the blood pressure more than ether does, and that with spinal anaesthesia there is no lowering of the blood pressure.

Treatment.--A patient suffering from shock should be placed in the recumbent position, with the foot of the bed raised to facilitate the return circulation in the large veins, and so to increase the flow of blood to the brain. His bed should be placed near a large fire, and the patient himself surrounded by cotton wool and blankets and hot-bottles. If he has lost much blood, the limbs should be wrapped in cotton wool and firmly bandaged from below upwards, to conserve as much of the circulating blood as possible in the trunk and head. If the shock is moderate in degree, as soon as the patient has been put to bed, about a pint of saline solution should be introduced into the rectum, and 10 to 15 minims of adrenalin chloride (1 in 1000) may with advantage be added to the fluid. The injection should be repeated every two hours until the circulation is sufficiently restored. In severe cases, especially when associated with haemorrhage, transfusion of whole blood from a compatible donor, is the most efficient means (Op. Surg.., p. 37). Cardiac stimulants such as strychnin, digitalin, or strophanthin are contra-indicated in shock, as they merely exhaust the already impaired vaso-motor centre.

Artificial respiration may be useful in tiding a patient over the critical period of shock, especially at the end of a severe operation.

Failing this, the introduction of saline solution at a temperature of about 105° F. into a vein or into the subcutaneous tissue is useful where much blood has been lost (p. 276). Two or three pints may be injected into a vein, or smaller quantities under the skin.

Thirst is best met by giving small quantities of warm water by the mouth, or by the introduction of saline solution into the rectum. Ice only relieves thirst for a short time, and as it is liable to induce flatulence should be avoided, especially in abdominal cases. Dryness of the tongue may be relieved by swabbing the mouth with a mixture of glycerine and lemon juice.

If severe pain calls for the use of morphin, 1/120th grain of atropin should be added, or heroin alone may be given in doses of 1/24th to 1/12th grain.

#Collapse# is a clinical condition which comes on more insidiously than shock, and which does not attain its maximum degree of severity for several hours. It is met with in the course of severe illnesses, especially such as are associated with the loss of large quantities of fluid from the body--for example, by severe diarrhoea, notably in Asiatic cholera; by persistent vomiting; or by profuse sweating, as in some cases of heat-stroke. Severe degrees of collapse follow sudden and profuse loss of blood.

Collapse often follows upon shock--for example, in intestinal perforations, or after abdominal operations complicated by peritonitis, especially if there is vomiting, as in cases of obstruction high up in

the intestine. The symptoms of collapse are aggravated if toxin absorption is superadded to the loss of fluid.

The clinical features of this condition are practically the same as those of shock; and it is treated on the same lines.

FAT EMBOLISM.--After various injuries and operations, but especially such as implicate the marrow of long bones--for example, comminuted fractures, osteotomies, resections of joints, or the forcible correction of deformities--fluid fat may enter the circulation in variable quantity. In the vast majority of cases no ill effects follow, but when the quantity is large or when the absorption is long continued certain symptoms ensue, either immediately, or more frequently not for two or three days. These are mostly referable to the lungs and brain.

In the lung the fat collects in the minute blood vessels and produces venous congestion and oedema, and sometimes pneumonia. Dyspnoea, with cyanosis, a persistent cough and frothy or blood-stained sputum, a feeble pulse and low temperature, are the chief symptoms.

When the fat lodges in the capillaries of the brain, the pulse becomes small, rapid, and irregular, delirium followed by coma ensues, and the condition is usually rapidly fatal.

Fat is usually to be detected in the urine, even in mild cases.

The treatment consists in tiding the patient over the acute stage of his illness, until the fat is eliminated from the blood vessels.

TRAUMATIC ASPHYXIA OR TRAUMATIC CYANOSIS.--This term has been applied to a condition which results when the thorax is so forcibly compressed that respiration is mechanically arrested for several minutes. It has occurred from being crushed in a struggling crowd, or under a fall of masonry, and in machinery accidents. When the patient is released, the face and the neck as low down as the level of the clavicles present an intense coloration, varying from deep purple to blue-black. The affected area is sharply defined, and on close inspection the appearance is found to be due to the presence of countless minute reddish-blue or black spots, with small areas or streaks of normal skin between them. The punctate nature of the coloration is best recognised towards the periphery of the affected area--at the junction of the brow with the hairy scalp, and where the dark patch meets the normal skin of the chest (Beach and Cobb). Pressure over the skin does not cause the colour to disappear as in ordinary cyanosis. It has been shown by Wright of Boston, that the coloration is due to stasis from mechanical over-distension of the veins and capillaries; actual extravasation into the tissues is exceptional. The sharply defined distribution of the coloration is attributed to the absence of functioning valves in the veins of the head and neck, so that when the increased intra-thoracic pressure is transmitted to these veins they become engorged. Under the conjunctivae there are extravasations of bright red blood; and sublingual haematoma has been observed (Beatson).

The discolouration begins to fade within a few hours, and after the second or third day it disappears, without showing any of the chromatic changes which characterise a bruise. The sub-conjunctival ecchymosis, however, persists for several weeks and disappears like other extravasations. Apart from combating the shock, or dealing with concomitant injuries, no treatment is called for.

DELIRIUM IN SURGICAL PATIENTS

Delirium is a temporary disturbance of mind which occurs in the course of certain diseases, and sometimes after injuries or operations. It may be associated with any of the acute pyogenic infections; with erysipelas, especially when it affects the head or face; or with chronic infective diseases of the urinary organs. In the various forms of meningitis also, and in some cases of injury to the head, it is common;

and it is sometimes met with after severe haemorrhage, and in cases of poisoning by such drugs as iodoform, cocaine, or alcohol. Delirium may also, of course, be a symptom of insanity.

Often there is merely incoherent muttering regarding past incidents or occupations, or about absent friends; or the condition may assume the form of excitement, of dementia, or of melancholia; and the symptoms are usually worst at night.

#Delirium Tremens# is seen in persons addicted to alcohol, who, as the result of accident or operation, are suddenly compelled to lie in bed. Although oftenest met with in habitual drunkards or chronic tipplers, it is by no means uncommon in moderate drinkers, and has even been seen in children.

Clinical Features. --The delirium, which has been aptly described as being of a "busy" character, usually manifests itself within a few days of the patient being laid up. For two or three days he refuses food, is depressed, suspicious, sleepless and restless, demanding to be allowed up. Then he begins to mutter incoherently, to pull off the bedclothes, and to attempt to get out of bed. There is general muscular tremor, most marked in the tongue, the lips, and the hands. The patient imagines that he sees all sorts of horrible beings around him, and is sometimes greatly distressed because of rats, mice, beetles, or snakes, which he fancies are crawling over him. The pulse is soft, rapid, and compressible; the temperature is only moderately raised (100 o-101 o F.), and as a rule there is profuse sweating. The digestion is markedly impaired, and there is often vomiting. Patients in this condition are peculiarly insensitive to pain, and may even walk about with a fractured leg without apparent discomfort.

In most cases the symptoms begin to pass off in three or four days; the patient sleeps, the hallucinations and tremors cease, and he gradually recovers. In other cases the temperature rises, the pulse becomes rapid, and death results from exhaustion.

The main indication in treatment is to secure sleep, and this is done by the administration of bromides, chloral, or paraldehyde, or of one or other of the drugs of which sulphonal, trional, and veronal are examples. Heroin in doses of from 1/24th to 1/12th grain is often of service. Morphin must be used with great caution. In some cases hyoscin (1/200 grain) injected hypodermically is found efficacious when all other means have failed, but this drug must be used with great discrimination. The patient must be encouraged to take plenty of easily digested fluid food, supplemented, if necessary, by nutrient enemata and saline infusions.

In the early stage a brisk mercurial purge is often of value. Alcohol should be withheld, unless failing of the pulse strongly indicates its use, and then it should be given along with the food.

A delirious patient must be constantly watched by a trained attendant or other competent person, lest he get out of bed and do harm to himself or others. Mechanical restraint is often necessary, but must be avoided if possible, as it is apt to increase the excitement and exhaust the patient. On account of the extreme restlessness, there is often great difficulty in carrying out the proper treatment of the primary surgical condition, and considerable modifications in splints and other appliances are often rendered necessary.

A form of delirium, sometimes spoken of as #Traumatic Delirium#, may follow on severe injuries or operations in persons of neurotic temperament, or in those whose nervous system is exhausted by overwork. It is met with apart from alcoholic intemperance. This form of delirium seems to be specially prone to ensue on operations on the face, the thyreoid gland, or the genito-urinary organs. The symptoms appear in from two to five days after the operation, and take the form of restlessness, sleeplessness, low incoherent muttering, and picking at the bedclothes. It is not necessarily attended by fever or by muscular tremors. The patient may show hysterical symptoms. This condition is

probably to be regarded as a form of insanity, as it is liable to merge into mania or melancholia.

The treatment is carried out on the same lines as that of delirium tremens.

CHAPTER XIV

THE BLOOD VESSELS

Anatomy--INJURIES OF ARTERIES: Varieties--INJURIES OF VEINS: Air Embolism--Repair of blood vessels and natural arrest of haemorrhage--HAEMORRHAGE: Varieties; Prevention; Arrest--Constitutional effects of haemorrhage--Haemophilia--DISEASES OF BLOOD VESSELS: Thrombosis; Embolism--Arteritis: Varieties; Arterio-sclerosis--Thrombo-phlebitis--Phlebitis: Varieties--VARIX--ANGIOMATA--Naevus: Varieties; Electrolysis--Cirsoid aneurysm--ANEURYSM: Varieties; Methods of treatment--ANEURYSMS OF INDIVIDUAL ARTERIES.

#Surgical Anatomy.---An artery has three coats: an internal coat--the tunica intima--made up of a single layer of endothelial cells lining the lumen; outside of this a layer of delicate connective tissue; and still farther out a dense tissue composed of longitudinally arranged elastic fibres--the internal elastic lamina. The tunica intima is easily ruptured. The middle coat, or tunica media, consists of non-striped muscular fibres, arranged for the most part concentrically round the vessel. In this coat also there is a considerable proportion of elastic tissue, especially in the larger vessels. The thickness of the vessel wall depends chiefly on the development of the muscular coat. The external coat, or tunica externa, is composed of fibrous tissue, containing, especially in vessels of medium calibre, some yellow elastic fibres in its deeper layers.

In most parts of the body the arteries lie in a sheath of connective tissue, from which fine fibrous processes pass to the tunica externa. The connection, however, is not a close one, and the artery when divided transversely is capable of retracting for a considerable distance within its sheath. In some of the larger arteries the sheath assumes the form of a definite membrane.

The arteries are nourished by small vessels--the vasa vasorum--which ramify chiefly in the outer coat. They are also well supplied with nerves, which regulate the size of the lumen by inducing contraction or relaxation of the muscular coat.

The veins are constructed on the same general plan as the arteries, the individual coats, however, being thinner. The inner coat is less easily ruptured, and the middle coat contains a smaller proportion of muscular tissue. In one important point veins differ structurally from arteries--namely, in being provided with valves which prevent reflux of the blood. These valves are composed of semilunar folds of the tunica intima strengthened by an addition of connective tissue. Each valve usually consists of two semilunar flaps attached to opposite sides of the vessel wall, each flap having a small sinus on its cardiac side. The distension of these sinuses with blood closes the valve and prevents regurgitation. Valves are absent from the superior and inferior vena cavae, the portal vein and its tributaries, the hepatic, renal, uterine, and spermatic veins, and from the veins in the lower part of the rectum. They are ill-developed or absent also in the iliac and common femoral veins--a fact which has an important bearing on the production of varix in the veins of the lower extremity.

The wall of capillaries consists of a single layer of endothelial cells.

HAEMORRHAGE

Various terms are employed in relation to haemorrhage, according to its seat, its origin, the time at which it occurs, and other circumstances.

The term external haemorrhage is employed when the blood escapes on the surface; when the bleeding takes place into the tissues or into a cavity it is spoken of as internal. The blood may infiltrate the connective tissue, constituting an extravasation of blood; or it may collect in a space or cavity and form a haematoma.

The coughing up of blood from the lungs is known as haemoptysis; vomiting of blood from the stomach, as haematemesis; the passage of black-coloured stools due to the presence of blood altered by digestion, as melaena; and the passage of bloody urine, as haematuria.

Haemorrhage is known as arterial, venous, or capillary, according to the nature of the vessel from which it takes place.

In arterial haemorrhage the blood is bright red in colour, and escapes from the cardiac end of the divided vessel in pulsating jets synchronously with the systole of the heart. In vascular parts--for example the face--both ends of a divided artery bleed freely. The blood flowing from an artery may be dark in colour if the respiration is impeded. When the heart's action is weak and the blood tension low the flow may appear to be continuous and not in jets. The blood from a divided artery at the bottom of a deep wound, escapes on the surface in a steady flow.

Venous bleeding is not pulsatile, but occurs in a continuous stream, which, although both ends of the vessel may bleed, is more copious from the distal end. The blood is dark red under ordinary conditions, but may be purplish, or even black, if the respiration is interfered with. When one of the large veins in the neck is wounded, the effects of respiration produce a rise and fall in the stream which may resemble arterial pulsation.

In capillary haemorrhage, red blood escapes from numerous points on the surface of the wound in a steady ooze. This form of bleeding is serious in those who are the subjects of haemophilia.

INJURIES OF ARTERIES

The following description of the injuries of arteries refers to the larger, named trunks. The injuries of smaller, unnamed vessels are included in the consideration of wounds and contusions.

#Contusion.--An artery may be contused by a blow or crush, or by the oblique impact of a bullet. The bruising of the vessel wall, especially if it is diseased, may result in the formation of a thrombus which occludes the lumen temporarily or even permanently, and in rare cases may lead to gangrene of the limb beyond.

#Subcutaneous Rupture.--An artery may be ruptured subcutaneously by a blow or crush, or by a displaced fragment of bone. This injury has been produced also during attempts to reduce dislocations, especially those of old standing at the shoulder. It is most liable to occur when the vessels are diseased. The rupture may be incomplete or complete.

Incomplete Subcutaneous Rupture.--In the majority of cases the rupture is incomplete--the inner and middle coats being torn, while the outer remains intact. The middle coat contracts and retracts, and the internal, because of its elasticity, curls up in the interior of the vessel, forming a valvular obstruction to the blood-flow. In most cases this results in the formation of a thrombus which occludes the vessel. In some cases the blood-pressure gradually distends the injured segment of the vessel wall and leads to the formation of an aneurysm.

The pulsation in the vessels beyond the seat of rupture is arrested--for a time at least--owing to the occlusion of the vessel, and the limb becomes cold and powerless. The pulsation seldom returns within five or six weeks of the injury, if indeed it is not permanently arrested, but, as a rule, a collateral circulation is rapidly established, sufficient to nourish the parts beyond. If the pulsation returns within a week of the injury, the presumption is that the occlusion was due to pressure from without--for example, by haemorrhage into the sheath or the pressure of a fragment of bone.

Complete Subcutaneous Rupture.--When the rupture is complete, all the coats of the vessel are torn and the blood escapes into the surrounding tissues. If the original injury is attended with much shock, the bleeding may not take place until the period of reaction. Rupture of the popliteal artery in association with fracture of the femur, or of the axillary or brachial artery with fracture of the humerus or dislocation of the shoulder, are familiar examples of this injury.

Like incomplete rupture, this lesion is accompanied by loss of pulsation and power, and by coldness of the limb beyond; a tense and excessively painful swelling rapidly appears in the region of the injury, and, where the cellular tissue is loose, may attain a considerable size. The pressure of the effused blood occludes the veins and leads to congestion and oedema of the limb beyond. The interference with the circulation, and the damage to the tissues, may be so great that gangrene ensues.

Treatment.--When an artery has been contused or ruptured, the limb must be placed in the most favourable condition for restoration of the circulation. The skin is disinfected and the limb wrapped in cotton wool to conserve its heat, and elevated to such an extent as to promote the venous return without at the same time interfering with the inflow of blood. A careful watch must be kept on the state of nutrition of the limb, lest gangrene occurs.

If no complications supervene, the swelling subsides, and recovery may be complete in six or eight weeks. If the extravasation is great and the skin threatens to give way, or if the vitality of the limb is seriously endangered, it is advisable to expose the injured vessel, and, after clearing away the clots, to attempt to suture the rent in the artery, or, if torn across, to join the ends after paring the bruised edges. If this is impracticable, a ligature is applied above and below the rupture. If gangrene ensues, amputation must be performed.

These descriptions apply to the larger arteries of the extremities. A good illustration of subcutaneous rupture of the arteries of the head is afforded by the tearing of the middle meningeal artery caused by the application of blunt violence to the skull; and of the arteries of the trunk--caused by the tearing of the renal artery in rupture of the kidney.

#Open Wounds of Arteries--Laceration.#--Laceration of large arteries is a common complication of machinery and railway accidents. The violence being usually of a tearing, twisting, or crushing nature, such injuries are seldom associated with much haemorrhage, as torn or crushed vessels quickly become occluded by contraction and retraction of their coats and by the formation of a clot. A whole limb even may be avulsed from the body with comparatively little loss of blood. The risk in such cases is secondary haemorrhage resulting from pyogenic infection.

The treatment is that applicable to all wounds, with, in addition, the ligation of the lacerated vessels.

#Punctured wounds# of blood vessels may result from stabs, or they may be accidentally inflicted in the course of an operation.

The division of the coats of the vessel being incomplete, the natural haemostasis that results from curling up of the intima and contraction of the media, fails to take place, and bleeding goes on into the surrounding tissues, and externally. If the sheath of the vessel is not

widely damaged, the gradually increasing tension of the extravasated blood retained within it may ultimately arrest the haemorrhage. A clot then forms between the lips of the wound in the vessel wall and projects for a short distance into the lumen, without, however, materially interfering with the flow through the vessel. The organisation of this clot results in the healing of the wound in the vessel wall.

In other cases the blood escapes beyond the sheath and collects in the surrounding tissues, and a traumatic aneurysm results. Secondary haemorrhage may occur if the wound becomes infected.

The treatment consists in enlarging the external wound to permit of the damaged vessel being ligated above and below the puncture. In some cases it may be possible to suture the opening in the vessel wall. When circumstances prevent these measures being taken, the bleeding may be arrested by making firm pressure over the wound with a pad; but this procedure is liable to be followed by the formation of an aneurysm.

Minute puncture of arteries such as frequently occur in the hypodermic administration of drugs and in the use of exploring needles, are not attended with any escape of blood, chiefly because of the elastic recoil of the arterial wall; a tiny thrombus of platelets and thrombus forms at the point where the intima is punctured.

#Incised Wounds.--We here refer only to such incised wounds as partly divide the vessel wall.

Longitudinal wounds show little tendency to gape, and are therefore not attended with much bleeding. They usually heal rapidly, but, like punctured wounds, are liable to be followed by the formation of an aneurysm.

When, however, the incision in the vessel wall is oblique or transverse, the retraction of the muscular coat causes the opening to gape, with the result that there is haemorrhage, which, even in comparatively small arteries, may be so profuse as to prove dangerous. When the associated wound in the soft parts is valvular the haemorrhage is arrested and an aneurysm may develop.

When a large arterial trunk, such as the external iliac, the femoral, the common carotid, the brachial, or the popliteal, has been partly divided, for example, in the course of an operation, the opening should be closed with sutures--arteriorrhaphy. The circulation being controlled by a tourniquet, or the artery itself occluded by a clamp, fine silk or catgut stitches are passed through the outer and middle coats after the method of Lembert, a fine, round needle being employed. The sheath of the vessel or an adjacent fascia should be stitched over the line of suture in the vessel wall. If infection be excluded, there is little risk of thrombosis or secondary haemorrhage; and even if thrombosis should develop at the point of suture, the artery is obstructed gradually, and the establishment of a collateral circulation takes place better than after ligation. In the case of smaller trunks, or when suture is impracticable, the artery should be tied above and below the opening, and divided between the ligatures.

#Gunshot Wounds of Blood Vessels.--In the majority of cases injuries of large vessels are associated with an external wound; the profusion of the bleeding indicates the size of the damaged vessel, and the colour of the blood and the nature of the flow denote whether an artery or a vein is implicated.

When an artery is wounded a firm haematoma may form, with an expansile pulsation and a palpable thrill--whether such a haematoma remains circumscribed or becomes diffuse depends upon the density or laxity of the tissues around it. In course of time a traumatic arterial aneurysm may develop from such a haematoma.

When an artery and its companion vein are injured simultaneously an arterio-venous aneurysm (p. 310) may develop. This frequently takes place without the formation of a haematoma as the arterial blood finds

its way into the vein and so does not escape into the tissues. Even if a haematoma forms it seldom assumes a great size. In time a swelling is recognised, with a palpable thrill and a systolic bruit, loudest at the level of the communication and accompanied by a continuous venous hum.

If leakage occurs into the tissues, the extravasated blood may occlude the vein by pressure, and the symptoms of arterial aneurysm replace those of the arterio-venous form, the systolic bruit persisting, while the venous hum disappears.

Gangrene may ensue if the blood supply is seriously interfered with, or the signs of ischaemia may develop; the muscles lose their elasticity, become hard and paralysed, and anaesthesia of the "glove" or "stocking" type, with other alterations of sensation ensue. Apart from ischaemia, reflex paralysis of motion and sensation of a transient kind may follow injury of a large vessel.

Treatment is carried out on the same lines as for similar injuries due to other causes.

INJURIES OF VEINS

Veins are subject to the same forms of injury as arteries, and the results are alike in both, such variations as occur being dependent partly on the difference in their anatomical structure, and partly on the conditions of the circulation through them.

#Subcutaneous rupture# of veins occur most frequently in association with fractures and in the reduction of dislocations. The veins most commonly ruptured are the popliteal, the axillary, the femoral, and the subclavian. On account of the smaller amount of elastic and muscular tissue in the wall of a vein, the contraction and retraction of its walls are less than in an artery, and so bleeding may continue for a longer period. On the other hand, owing to the lower blood-pressure the outflow goes on more slowly, and the gradually increasing pressure produced by the extravasated blood is usually sufficient to arrest the haemorrhage before it becomes serious. As an aid in diagnosing the source of the bleeding, it should be remembered that the rupture of a vein does not affect the pulsation in the limb beyond. The risks are practically the same as when an artery is ruptured, excepting that of aneurysm, and the treatment is carried out on the same lines, but it is seldom necessary to operate for the purpose of applying a ligature to the injured vein.

#Wounds# of veins--punctured and incised--frequently occur in the course of operations; for example, in the removal of tumours or diseased glands from the neck, the axilla, or the groin. They are also met with as a result of accidental stabs and of suicidal or homicidal injuries. The haemorrhage from a large vein so damaged is usually profuse, but it is more readily controlled by external pressure than that from an artery. When a vein is merely punctured, the bleeding may be arrested by pressure with a pad of gauze, or by a lateral ligature--that is, picking up the margins of the rent in the wall and securing them with a ligature without occluding the lumen. In the large veins, such as the internal jugular, the femoral, or the axillary, it is usually possible to suture the opening in the wall. This does not necessarily result in thrombosis in the vessel, or in obliteration of its lumen.

When an artery and vein are simultaneously wounded, the features peculiar to each are present in greater or less degree. In the limbs gangrene may ensue, especially if the wound is infected. Punctured and gun-shot wounds implicating both artery and vein are liable to be followed by the development of arterio-venous aneurysm.

#Entrance of Air into Veins--Air Embolism.#--This serious, though fortunately rare, accident is apt to occur in the course of operations in the region of the thorax, neck, or axilla, if a large vein is opened and fails to collapse on account of the rigidity of its walls, its incorporation in a dense fascia, or from traction being made upon it. If

the wound in a vein is thus held open, the negative pressure during inspiration sucks air into the right side of the heart. This is accompanied by a hissing or gurgling sound, and with the next expiration some frothy blood escapes from the wound. The patient instantly becomes pale, the pupils dilate, respiration becomes laboured, and although the heart may continue to beat forcibly, the peripheral pulse is weak, and may even be imperceptible. On auscultating the heart, a churning sound may be heard. Death may result in a few minutes; or the heart may slowly regain its power and recovery take place.

Prevention.--In operations in the "dangerous area"--as the region of the root of the neck is called in this connection--care must be taken not to cut or divide any vein before it has been secured by forceps, and to apply ligatures securely and at once. Deep wounds in this region should be kept filled with normal salt solution. Immediately a cut is recognised in a vein, a finger should be placed over the vessel on the cardiac side of the wound, and kept there until the opening is secured.

Treatment.--Little can be done after the air has actually entered the vein beyond endeavouring to maintain the heart's action by hypodermic injections of ether or strychnine and the application of mustard or hot cloths over the chest. The head at the same time should be lowered to prevent syncope. Attempts to withdraw the air by suction, and the employment of artificial respiration, have proved futile, and are, by some, considered dangerous. In a desperate case massage of the heart might be tried.

THE NATURAL ARREST OF HAEMORRHAGE AND THE REPAIR OF BLOOD VESSELS

#Primary Haemorrhage.#--The term primary haemorrhage is applied to the bleeding which follows immediately on the wounding of a blood vessel. The natural process by which such haemorrhage is arrested varies with the character of the wound in the vessel and may be modified by accidental circumstances.

(a) Repair of completely divided Artery.--When an artery is completely divided, the circular fibres of the muscular coat contract, so that the lumen of the cut ends is diminished, and at the same time each segment retracts within its sheath in virtue of the recoil of the elastic elements in its walls, the tunica intima curls up in the interior of the vessel, and the tunica externa collapses over the cut ends. The blood that escapes from the injured vessel fills the interstices of the tissues, and, coagulating, forms a clot which temporarily arrests the bleeding. That part of the clot which lies between the divided ends of the vessel and in the cellular tissue outside, is known as the external clot, while the portion which projects into the lumen of the vessel is known as the internal clot, and it usually extends as far as the nearest collateral branch. These processes constitute what is known as the temporary arrest of haemorrhage, which, it will be observed, is effected by the contraction and retraction of the divided artery and by clotting.

The permanent arrest takes place by the transformation of the clot into scar tissue. The internal clot plays the most important part in the process; it becomes invaded by leucocytes and proliferating endothelial and connective-tissue cells, and new blood vessels permeate the mass, which is thus converted into granulation tissue. This is ultimately replaced by fibrous tissue, which permanently occludes the end of the vessel. Concurrently and by the same process the external clot is converted into scar tissue.

If a divided artery is ligated at its cut end, the tension of the ligature is usually sufficient to rupture the inner and middle coats, which curl up within the lumen, the outer coat alone being held in the grasp of the ligature. An internal clot forms and, becoming organised, permanently occludes the vessel as above described. The ligature and the small portion of vessel beyond it are subsequently absorbed.

In course of time the collateral branches of the vessel above and below the level of section enlarge and their inter-communication becomes more free, so that even when large trunks have been divided the vascular supply of the parts beyond may be completely restored. This is known as the development of the collateral circulation.

Imperfect Collateral Circulation.--While the development of the collateral circulation after the ligation or obstruction from other cause of a main arterial trunk may be sufficient to prevent gangrene of the limb, it may be insufficient for its adequate nourishment; it may be cold, bluish in colour, and there may be necrosis of the skin over bony points; this is notably the case in the lower extremity after ligation of the femoral or popliteal artery, when patches of skin may die over the prominence of the heel, the balls of the toes, the projecting base of the fifth metatarsal and the external malleolus.

If, during the period of reaction, the blood-pressure rises

considerably, the occluding clot at the divided end of the vessel may be washed away or the ligature displaced, permitting of fresh bleeding taking place--reactionary or intermediary haemorrhage (p. 272).

In the event of the wound becoming infected with pyogenic organisms, the occluding blood-clot or the young fibrous tissue may become disintegrated in the suppurative process, and the bleeding start afresh--secondary haemorrhage (p. 273).

(b) If an artery is only partly cut across, the divided fibres of the tunica muscularis contract and those of the tunica externa retract, with the result that a more or less circular hole is formed in the wall of the vessel, from which free bleeding takes place, as the conditions are unfavourable for the formation of an occluding clot. Even if a clot does form, when the blood-pressure rises it is readily displaced, leading to reactionary haemorrhage. Should the wound become infected, secondary haemorrhage is specially liable to occur. A further risk attends this form of injury, in that the intra-vascular tension may in time lead to gradual stretching of the scar tissue which closes the gap in the vessel wall, with the result that a localised dilatation or diverticulum forms, constituting a traumatic aneurysm.

(c) When the injury merely takes the form of a puncture or small incision a blood-clot forms between the edges, becomes organised, and is converted into cicatricial tissue which seals the aperture. Such wounds may also be followed by reactionary or secondary haemorrhage, or later by the formation of a traumatic aneurysm.

Conditions which influence the Natural Arrest of Haemorrhage.--The natural arrest of bleeding is favoured by tearing or crushing of the vessel walls, owing to the contraction and retraction of the coats and the tendency of blood to coagulate when in contact with damaged tissue. Hence the primary haemorrhage following lacerated wounds is seldom copious. The occurrence of syncope or of profound shock also helps to stop bleeding by reducing the force of the heart's action.

On the other hand, there are conditions which retard the natural arrest. When, for example, a vessel is only partly divided, the contraction and retraction of the muscular coat, instead of diminishing the calibre of the artery, causes the wound in the vessel to gape; by completing the division of the vessel under these circumstances the bleeding can often be arrested. In certain situations, also, the arteries are so intimately connected with their sheaths, that when cut across they were unable to retract and contract--for example, in the scalp, in the penis, and in bones--and copious bleeding may take place from comparatively small vessels. This inability of the vessels to contract and retract is met with also in inflamed and oedematous parts and in scar tissue. Arteries divided in the substance of a muscle also sometimes bleed unduly. Any increase in the force of the heart's action, such as may result from exertion, excitement, or over-stimulation, also interferes with the natural arrest. Lastly, in bleeders, there are conditions which interfere with the natural arrest of haemorrhage.

#Repair of a Vessel ligated in its Continuity.--When a ligature is applied to an artery it should be pulled sufficiently tight to occlude the lumen without causing rupture of its coats. It often happens, however, that the compression causes rupture of the inner and middle coats, so that only the outer coat remains in the grasp of the ligature. While this weakens the wall of the vessel, it has the advantage of hastening coagulation, by bringing the blood into contact with damaged tissue. Whether the inner and middle coats are ruptured or not, blood coagulates both above and below the ligature, the proximal clot being longer and broader than that on the distal side. In small arteries these clots extend as far as the nearest collateral branch, but in the larger trunks their length varies. The permanent occlusion of those portions of the vessel occupied by clot is brought about by the formation of granulation tissue, and its replacement by cicatricial tissue, so that the occluded segment of the vessel is represented by a fibrous cord. In this process the coagulum only plays a passive role by forming a scaffolding on which the granulation tissue is built up. The ligature surrounding the vessel, and the elements of the clot, are ultimately absorbed.

#Repair of Veins.--The process of repair in veins is the same as that in arteries, but the thrombosed area may become canalised and the circulation through the vessel be re-established.

HAEMORRHAGE IN SURGICAL OPERATIONS

The management of the haemorrhage which accompanies an operation includes (a) preventive measures, and (b) the arrest of the bleeding.

#Prevention of Haemorrhage.--Whenever possible, haemorrhage should be controlled by digital compression of the main artery supplying the limb rather than by a tourniquet. If efficiently applied compression reduces the immediate loss of blood to a minimum, and the bleeding from small vessels that follows the removal of the tourniquet is avoided. Further, the pressure of a tourniquet has been shown to be a material factor in producing shock.

In selecting a point at which to apply digital compression, it is essential that the vessel should be lying over a bone which will furnish the necessary resistance. The common carotid, for example, is pressed backward and medially against the transverse process (carotid tubercle) of the sixth cervical vertebra; the temporal against the temporal process (zygoma) in front of the ear; and the facial against the mandible at the anterior edge of the masseter.

In the upper extremity, the subclavian is pressed against the first rib by making pressure downwards and backwards in the hollow above the clavicle; the axillary and brachial by pressing against the shaft of the humerus.

In the lower extremity, the femoral is controlled by pressing in a direction backward and slightly upward against the brim of the pelvis, midway between the symphysis pubis and the anterior superior iliac spine.

The abdominal aorta may be compressed against the bodies of the lumbar vertebrae opposite the umbilicus, if the spine is arched well forwards over a pillow or sand-bag, or by the method suggested by Macewen, in which the patient's spine is arched forwards by allowing the lower extremities and pelvis to hang over the end of the table, while the assistant, standing on a stool, applies his closed fist over the abdominal aorta and compresses it against the vertebral column. Momburg recommends an elastic cord wound round the body between the iliac crest and the lower border of the ribs, but this procedure has caused serious damage to the intestine.

When digital compression is not available, the most convenient and certain means of preventing haemorrhage--say in an amputation--is by the

use of some form of tourniquet, such as the elastic tube of Esmarch or of Foulis, or an elastic bandage, or the screw tourniquet of Petit. Before applying any of these it is advisable to empty the limb of blood. This is best done after the manner suggested by Lister: the limb is held vertical for three or four minutes; the veins are thus emptied by gravitation, and they collapse, and as a physiological result of this the arteries reflexly contract, so that the quantity of blood entering the limb is reduced to a minimum. With the limb still elevated the tourniquet is firmly applied, a part being selected where the vessel can be pressed directly against a bone, and where there is no risk of exerting injurious pressure on the nerve-trunks. The tourniquet should be applied over several layers of gauze or lint to protect the skin, and the first turn of the tourniquet must be rapidly and tightly applied to arrest completely the arterial flow, otherwise the veins only are obstructed and the limb becomes congested. In the lower extremity the best place to apply a tourniquet is the middle third of the thigh; in the upper extremity, in the middle of the arm. A tourniquet should never be applied tighter or left on longer than is absolutely necessary.

The screw tourniquet of Petit is to be preferred when it is desired to intermit the flow through the main artery as in operations for aneurysm.

When a tourniquet cannot conveniently be applied, or when its presence interferes with the carrying out of the operation--as, for example, in amputations at the hip or shoulder--the haemorrhage may be controlled by preliminary ligation of the main artery above the seat of operation--for instance, the external iliac or the subclavian. For such contingencies also the steel skewers used by Spence and Wyeth, or a special clamp or forceps, such as that suggested by Lynn Thomas, may be employed. In the case of vessels which it is undesirable to occlude permanently, such as the common carotid, the temporary application of a ligature or clamp is useful.

#Arrest of Haemorrhage.--Ligature.--This is the best means of securing the larger vessels. The divided vessel having been caught with forceps as near to its cut end as possible, a ligature of catgut or silk is tied round it. When there is difficulty in applying a ligature securely, for example in a dense tissue like the scalp or periosteum, or in a friable tissue like the thyroid gland or the mesentery, a stitch should be passed so as to surround the bleeding vessel a short distance from its end, in this way ensuring a better hold and preventing the ligature from slipping.

If the haemorrhage is from a partly divided vessel, this should be completely cut across to enable its walls to contract and retract, and to facilitate the application of forceps and ligatures.

Torsion.--This method is seldom employed except for comparatively small vessels, but it is applicable to even the largest arteries. In employing torsion, the end of the vessel is caught with forceps, and the terminal portion twisted round several times. The object is to tear the inner and middle coats so that they curl up inside the lumen, while the outer fibrous coat is twisted into a cord which occludes the end of the vessel.

Forci-pressure.--Bleeding from the smallest arteries and from arterioles can usually be arrested by firmly squeezing them for a few minutes with artery forceps. It is usually found that on the removal of the forceps at the end of an operation no further haemorrhage takes place. By the use of specially strong clamps, such as the angiotribes of Doyen, large trunks may be occluded by pressure.

Cautery.--The actual cautery or Paquelin's thermo-cautery is seldom employed to arrest haemorrhage, but is frequently useful in preventing it, as, for example, in the removal of piles, or in opening the bowel in colostomy. It is used at a dull-red heat, which sears the divided ends of the vessel and so occludes the lumen. A bright-red or a white heat cuts the vessel across without occluding it. The separation of the slough produced by the charring of the tissues is sometimes attended with secondary bleeding.

Haemostatics_ or _Styptics_--The local application of haemostatics is seldom to be recommended. In the treatment of epistaxis or bleeding from the nose, of haemorrhage from the socket of a tooth, and sometimes from ulcerating or granulating surfaces, however, they may be useful. All clots must be removed and the drug applied directly to the bleeding surface. Adrenalin and turpentine are the most useful drugs for this purpose.

Haemorrhage from bone, for example the skull, may be arrested by means of Horsley's aseptic plastic wax. To stop persistent oozing from soft tissues, Horsley successfully applied a portion of living vascular tissue, such as a fragment of muscle, which readily adheres to the oozing surface and yields elements that cause coagulation of the blood by thrombo-kinetic processes. When examined after two or three days the muscle has been found to be closely adherent and undergoing organisation.

#Arrest of Accidental Haemorrhage.--The most efficient means of temporarily controlling haemorrhage is by pressure applied with the finger, or with a pad of gauze, directly over the bleeding point. While this is maintained an assistant makes digital pressure, or applies a tourniquet, over the main vessel of the limb on the proximal side of the bleeding point. A useful emergency tourniquet may be improvised by folding a large handkerchief en cravatte, with a cork or piece of wood in the fold to act as a pad. The handkerchief is applied round the limb, with the pad over the main artery, and the ends knotted on the lateral aspect of the limb. With a strong piece of wood the handkerchief is wound up like a Spanish windlass, until sufficient pressure is exerted to arrest the bleeding.

When haemorrhage is taking place from a number of small vessels, its arrest may be effected by elevation of the bleeding part, particularly if it is a limb. By this means the force of the circulation is diminished and the formation of coagula favoured. Similarly, in wounds of the hand or forearm, or of the foot or leg, bleeding may be arrested by placing a pad in the flexure and acutely flexing the limb at the elbow or knee respectively.

#Reactionary Haemorrhage.--Reactionary or intermediary haemorrhage is really a recurrence of primary bleeding. As the name indicates, it occurs during the period of reaction--that is, within the first twelve hours after an operation or injury. It may be due to the increase in the blood-pressure that accompanies reaction displacing clots which have formed in the vessels, or causing vessels to bleed which did not bleed during the operation; to the slipping of a ligature; or to the giving way of a grossly damaged portion of the vessel wall. In the scrotum, the relaxation of the dartos during the first few hours after operation occasionally leads to reactionary haemorrhage.

As a rule, reactionary haemorrhage takes place from small vessels as a result of the displacement of occluding clots, and in many cases the haemorrhage stops when the bandages and soaked dressings are removed. If not, it is usually sufficient to remove the clots and apply firm pressure, and in the case of a limb to elevate it. Should the haemorrhage recur, the wound must be reopened, and ligatures applied to the bleeding vessels. Douching the wound with hot sterilised water (about 110° F.), and plugging it tightly with gauze, are often successful in arresting capillary oozing. When the bleeding is more copious, it is usually due to a ligature having slipped from a large vessel such as the external jugular vein after operations in the neck, and the wound must be opened up and the vessel again secured. The internal administration of heroin or morphin, by keeping the patient quiet, may prove useful in preventing the recurrence of haemorrhage.

#Secondary Haemorrhage.--The term secondary haemorrhage refers to bleeding that is delayed in its onset and is due to pyogenic infection of the tissues around an artery. The septic process causes softening and erosion of the wall of the artery so that it gives way under the pressure of the contained blood. The leakage may occur in drops, or as a

rush of blood, according to the extent of the erosion, the size of the artery concerned, and the relations of the erosion to the surrounding tissues. When met with as a complication of a wound there is an interval--usually a week to ten days--between the receipt of the wound and the first haemorrhage, this time being required for the extension of the septic process to the wall of the artery and the consequent erosion of its coats. When secondary haemorrhage occurs apart from a wound, there is a similar septic process attacking the wall of the artery from the outside; for example in sloughing sore-throat, the separation of a slough may implicate the wall of an artery and be followed by serious and it may be fatal haemorrhage. The mechanical pressure of a fragment of bone or of a rubber drainage tube upon the vessel may aid the septic process in causing erosion of the artery. In pre-Listerian days, the silk ligature around the artery likewise favoured the changes that lead to secondary haemorrhage, and the interesting observation was often made, that when the collateral circulation was well established, the leakage occurred on the distal side of the ligature. While it may happen that the initial haemorrhage is rapidly fatal, as for example when the external carotid or one of its branches suddenly gives way, it is quite common to have one, two or more warning haemorrhages before the leakage on a large scale, which is rapidly fatal.

The appearances of the wound in cases complicated by secondary haemorrhage are only characteristic in so far that while obviously infected, there is an absence of all reaction; instead of frankly suppurating, there is little or no discharge and the surrounding cellular tissue and the limb beyond are oedematous and pit on pressure.

The general symptoms of septic poisoning in cases of secondary haemorrhage vary widely in severity: they may be so slight that the general health is scarcely affected and the convalescence from an operation, for example, may be apparently normal except that the wound does not heal satisfactorily. For example, a patient may be recovering from an operation such as the removal of an epithelioma of the mouth, pharynx or larynx and the associated lymph glands in the neck, and be able to be up and going about his room, when, suddenly, without warning and without obvious cause, a rush of blood occurs from the mouth or the incompletely healed wound in the neck, causing death within a few minutes.

On the other hand, the toxæmia may be of a profound type associated with marked pallor and progressive failure of strength, which, of itself, even when the danger from haemorrhage has been overcome, may have a fatal termination. The prognosis therefore in cases of secondary haemorrhage can never be other than uncertain and unfavourable; the danger from loss of blood per se is less when the artery concerned is amenable to control by surgical measures.

Treatment.--The treatment of secondary haemorrhage includes the use of local measures to arrest the bleeding, the employment of general measures to counteract the accompanying toxæmia, and when the loss of blood has been considerable, the treatment of the bloodless state.

Local Measures to arrest the Haemorrhage.--The occurrence of even slight haemorrhages from a septic wound in the vicinity of a large blood vessel is to be taken seriously; it is usually necessary to open up the wound, clear out the clots and infected tissues with a sharp spoon, disinfect the walls of the cavity with eusol or hydrogen peroxide, and pack it carefully but not too tightly with gauze impregnated with some antiseptic, such as "bipp," so that, if the bleeding does not recur, it may be left undisturbed for several days. The packing should if possible be brought into actual contact with the leaking point in the vessel, and so arranged as to make pressure on the artery above the erosion. The dressings and bandage are then applied, with the limb in the attitude that will diminish the force of the stream through the main artery, for example, flexion at the elbow in haemorrhage from the deep palmar arch. Other measures for combating the local sepsis, such as the irrigation method of Carrel, may be considered.

If the wound involves one of the extremities, it may be useful; and it

imparts confidence to the nurse, and, it may be, to the patient, if a Petit's tourniquet is loosely applied above the wound, which the nurse is instructed to tighten up in the event of bleeding taking place.

Ligation of the Artery.--If the haemorrhage recurs in spite of packing the wound, or if it is serious from the outset and likely to be critical if repeated, ligation of the artery itself or of the trunk from which it springs, at a selected spot higher up, should be considered. This is most often indicated in wounds of the extremities.

As examples of proximal ligation for secondary haemorrhage may be cited ligation of the hypogastric artery for haemorrhage in the buttock, of the common iliac for haemorrhage in the thigh, of the brachial in the upper arm for haemorrhage from the deep palmar arch, and of the posterior tibial behind the medial malleolus for haemorrhage from the sole of the foot.

Amputation is the last resource, and should be decided upon if the haemorrhage recurs after proximal ligation, or if this has been followed by gangrene of the limb; it should also be considered if the nature of the wound and the virulence of the sepsis would of themselves justify removal of the limb. Every surgeon can recall cases in which a timely amputation has been the means of saving life.

The counteraction of the toxæmia and the treatment of the bloodless state, are carried out on the usual lines.

#Haemorrhage of Toxic Origin.--Mention must also be made of haemorrhages which depend upon infective or toxic conditions and in which no gross lesion of the vessels can be discovered. The bleeding occurs as an oozing, which may be comparatively slight and unimportant, or by its persistence may become serious. It takes place into the superficial layers of the skin, from mucous membranes, and into the substance of such organs as the pancreas. Haemorrhage from the stomach and intestine, attended with a brown or black discolouration of the vomit and of the stools, is one of the best known examples: it is not uncommonly met with in infective conditions originating in the appendix, intestine, gall-bladder, and other abdominal organs. Haemorrhage from the mucous membrane of the stomach after abdominal operations--apparently also due to toxic causes and not to the operation--gives rise to the so-called post-operative haematemesis.

#Constitutional Effects of Haemorrhage.--The severity of the symptoms resulting from haemorrhage depends as much on the rapidity with which the bleeding takes place as on the amount of blood lost. The sudden loss of a large quantity, whether from an open wound or into a serous cavity--for example, after rupture of the liver or spleen--is attended with marked pallor of the surface of the body and coldness of the skin, especially of the face, feet, and hands. The skin is moist with a cold, clammy sweat, and beads of perspiration stand out on the forehead. The pulse becomes feeble, soft, and rapid, and the patient is dull and listless, and complains of extreme thirst. The temperature is usually sub-normal; and the respiration rapid, shallow, and sighing in character. Abnormal visual sensations, in the form of flashes of light or spots before the eyes; and rushing, buzzing, or ringing sounds in the ears, are often complained of.

In extreme cases, phenomena which have been aptly described as those of "air-hunger" ensue. On account of the small quantity of blood circulating through the body, and the diminished haemoglobin content of the blood, the tissues are imperfectly oxygenated, and the patient becomes extremely restless, gasping for breath, constantly throwing about his arms and baring his chest in the vain attempt to breath more freely. Faintness and giddiness are marked features. The diminished supply of oxygen to the brain and to the muscles produces muscular twitchings, and sometimes convulsions. Finally the pupils dilate, the sphincters relax, and death ensues.

Young children stand the loss of blood badly, but they quickly recover, as the regeneration of blood takes place rapidly. In old people also,

and especially when they are fat, the loss of blood is badly borne, and the ill effects last longer. Women, on the whole, stand loss of blood better than men, and in them the blood is more rapidly re-formed. A few hours after a severe haemorrhage there is usually a leucocytosis of from 15,000 to 30,000.

#Treatment of the Bloodless State.--The patient should be placed in a warm, well-ventilated room, and the foot of the bed elevated. Cardiac stimulants, such as strychnine or alcohol, must be judiciously administered, over-stimulation being avoided. The inhalation of oxygen has been found useful in relieving the urgent symptoms of dyspnoea.

The blood may be emptied from the limbs into the vessels of the trunk, where it is more needed, by holding them vertically in the air for a few minutes, and then applying a firm elastic bandage over a layer of cotton wool, from the periphery towards the trunk.

_Introduction of Fluids into the Circulation.--The most valuable measure for maintaining the circulation, however, is by transfusion of blood (Op. Surg., p. 37). If this is not immediately available the introduction of from one to three pints of physiological salt solution (a teaspoonful of common salt to a pint of water) into a vein, or a 6 per cent. solution of gum acacia, is a useful expedient. The solution is sterilised by boiling, and cooled to a temperature of about 105° F. The addition of 5 to 10 minims of adrenalin solution (1 in 1000) is advantageous in raising the blood-pressure (Op. Surg., p. 565).

When the intra-venous method is not available, one or two pints of saline solution with adrenalin should be slowly introduced into the rectum, by means of a long rubber tube and a filler. Satisfactory, although less rapidly obtained results follow the introduction of saline solution into the cellular tissue--for example, under the mamma, into the axilla, or under the skin of the back.

If the patient can retain fluids taken by the mouth--such as hot coffee, barley water, or soda water--these should be freely given, unless the injury necessitates operative treatment under a general anaesthetic.

Transfusion of blood is most valuable as a preliminary to operation in patients who are bloodless as a result of haemorrhage from gastric and duodenal ulcers, and in bleeders.

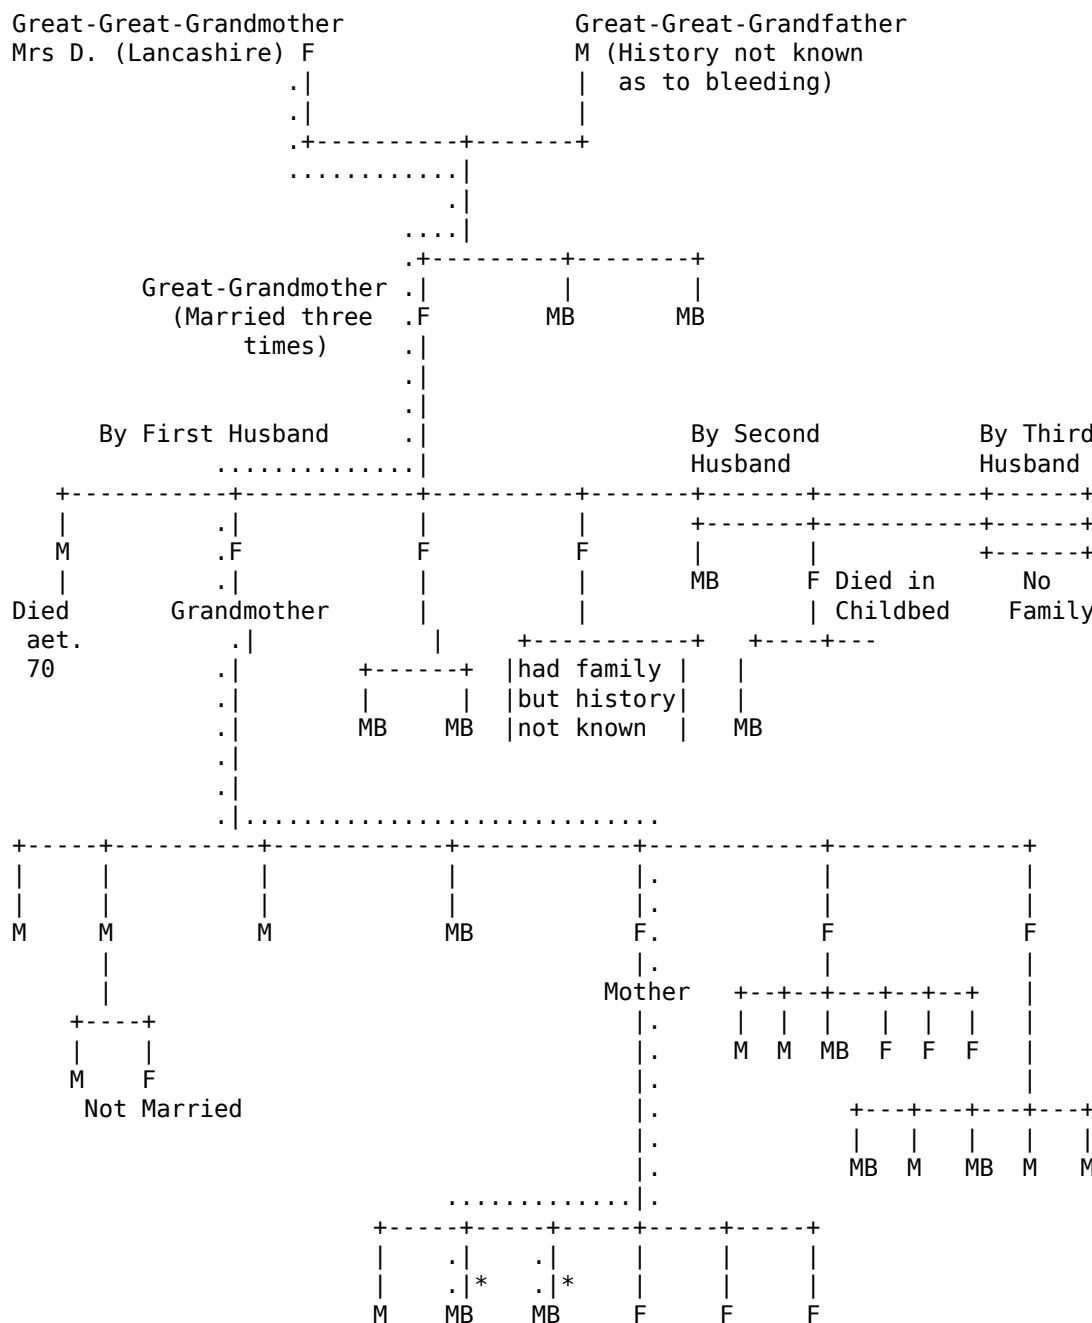

HAEMOPHILIA

The term haemophilia is applied to an inherited disease which renders the patient liable to serious haemorrhage from even the most trivial injuries; and the subjects of it are popularly known as "bleeders."

The cause of the disease and its true nature are as yet unknown. There is no proof of any structural defect in the blood vessels, and beyond the fact that there is a diminution in the number of blood-plates, it has not been demonstrated that there is any alteration in the composition of the blood.

The affection is in a marked degree hereditary, all the branches of an affected family being liable to suffer. Its mode of transmission to individuals, moreover, is characteristic: the male members of the stock alone suffer from the affection in its typical form, while the tendency is transmitted through the female line. Thus the daughters of a father who is a bleeder, whilst they do not themselves suffer from the disease, transmit the tendency to their male offspring. The sons, on the other hand, neither suffer themselves nor transmit the disease to their children (Fig. 64). The female members of a haemophilic stock are often very prolific, and there is usually a predominance of daughters in their families.

FIG 64.--Genealogical Tree of a Haemophilic Family.

F = Females. M = Males (not bleeders). MB = Males (bleeders)

** the patients observed by the authors. The dotted line shows the transmission of the disease to our patients through four generations.

The disease is met with in boys who are otherwise healthy, and usually manifests itself during the first few years of life. In rare instances profuse haemorrhage takes place when the umbilical cord separates. As a rule the first evidence is the occurrence of long-continued and uncontrollable bleeding from a comparatively slight injury, such as the scratch of a pin, the extraction of a tooth, or after the operation of circumcision. The blood oozes slowly from the capillaries; at first it appears normal, but after flowing for some days, or it may be weeks, it becomes pale, thin, and watery, and shows less and less tendency to coagulate.

Female members of haemophilia families sometimes show a tendency to excessive haemorrhage, but they seldom manifest the characteristic features met with in the male members.

Sometimes the haemorrhage takes place apparently spontaneously from the

gums, the nasal or the intestinal mucous membrane. In other cases the bleeding occurs into the cellular tissue under the skin or mucous membrane, producing large areas of ecchymosis and discoloration. One of the commonest manifestations of the disease is the occurrence of haemorrhage into the cavities of the large joints, especially the knee, elbow, or hip. The patient suffers repeatedly from such haemorrhages, the determining injury being often so slight as to have passed unobserved.

There is evidence that the tendency to bleed is greater at certain times than at others--in some cases showing almost a cyclical character--although nothing is known as to the cause of the variation.

After a severe haemorrhage into the cellular tissue or into a joint, the patient becomes pale and anaemic, the temperature may rise to 102 o or 103 o F., the pulse become small and rapid, and haemic murmurs are sometimes developed over the heart and large arteries. The swelling is tense, fluctuating, and hot, and there is considerable pain and tenderness.

In exceptional cases, blisters form over the seat of the effusion, or the skin may even slough, and the clinical features may therefore come to simulate closely those of an acute suppurative condition. When the skin sloughs, an ulcer is formed with altered blood-clot in its floor like that seen in scurvy, and there is a remarkable absence of any attempt at healing.

The acute symptoms gradually subside, and the blood is slowly absorbed, the discoloration of the skin passing through the same series of changes as occur after an ordinary bruise. The patients seldom manifest the symptoms of the bloodless state, and the blood is rapidly regenerated.

The diagnosis is easy if the patient or his friends are aware of the family tendency to haemorrhage and inform the doctor of it, but they are often sensitive and reticent regarding the fact, and it may only be elicited after close investigation. From the history it is usually easy to exclude scurvy and purpura. Repeated haemorrhages into a joint may result in appearances which closely simulate those of tuberculous disease. Recent haemorrhages into the cellular tissue often present clinical features closely resembling those of acute cellulitis or osteomyelitis. A careful examination, however, may reveal ecchymoses on other parts of the body which give a clue to the nature of the condition, and may prevent the disastrous consequences that may follow incision.

These patients usually succumb sooner or later to haemorrhage, although they often survive several severe attacks. After middle life the tendency to bleed appears to diminish.

Treatment.--As a rule the ordinary means of arresting haemorrhage are of little avail. From among the numerous means suggested, the following may be mentioned: The application to the bleeding point of gauze soaked in a 1 in 1000 solution of adrenalin; prolonged inhalation of oxygen; freezing the part with a spray of ethyl-chloride; one or more subcutaneous injections of gelatin--5 ounces of a 2 1/2 per cent. solution of white gelatin in normal salt solution being injected at a temperature of about 100 o F.; the injection of pituitary extract. The application of a pad of gauze soaked in the blood of a normal person sometimes arrests the bleeding.

To prevent bleeding in haemophiliacs, intra-venous or subcutaneous injections of fresh blood serum, taken from the human subject, the sheep, the dog, or the horse, have proved useful. If fresh serum is not available, anti-diphtheritic or anti-tetanic serum or trade preparations, such as hemoplasmin, may be employed. We have removed the appendix and amputated through the thigh in haemophilic subjects without excessive loss of blood after a course of fresh sheep's serum given by the mouth over a period of several weeks.

The chloride and lactate of calcium, and extract of thymus gland have been employed to increase the coagulability of the blood. The patient

should drink large quantities of milk, which also increases the coagulability of the blood. Monro has observed remarkable results from the hypodermic injection of emetin hydrochloride in 1/2-grain doses.

THROMBOSIS AND EMBOLISM

The processes known as thrombosis and embolism are so intimately associated with the diseases of blood vessels that it is convenient to define these terms in the first instance.

#Thrombosis.--The term thrombus is applied to a clot of blood formed in the interior of the heart or of a blood vessel, and the process by which such a clot forms is known as thrombosis. It would appear that slowing or stagnation of the blood-stream, and interference with the integrity of the lining membrane of the vessel wall, are the most important factors determining the formation of the clot. Alterations in the blood itself, such as occur, for example, in certain toxæmias, also favour coagulation. When the thrombus is formed slowly, it consists of white blood cells with a small proportion of fibrin, and, being deposited in successive layers, has a distinctly laminated appearance on section. It is known as a white thrombus or laminated clot, and is often met with in the sac of an aneurysm (Fig. 72). When rapidly formed in a vessel in which the blood is almost stagnant--as, for example, in a pouched varicose vein--the blood coagulates en masse, and the clot consists of all the elements of the blood, constituting a red thrombus (Fig. 66). Sometimes the thrombus is mixed--a red thrombus being deposited on a white one, it may be in alternate layers.

When aseptic, a thrombus may become detached and be carried off in the blood-stream as an embolus; it may become organised; or it may degenerate and undergo calcification. Occasionally a small thrombus situated behind a valve in a varicose vein or in the terminal end of a dilated vein--for example in a pile--undergoes calcification, and is then spoken of as a phlebolith; it gives a shadow with the X-rays.

When infected with pyogenic bacteria, the thrombus becomes converted into pus and a localised abscess forms; or portions of the thrombus may be carried as emboli in the circulation to distant parts, where they give rise to secondary foci of suppuration--pyaemic abscesses.

#Embolism.--The term embolus is applied to any body carried along in the circulation and ultimately becoming impacted in a blood vessel. This occurrence is known as embolism. The commonest forms of embolus are portions of thrombi or of fibrinous formations on the valves of the heart, the latter being usually infected with micro-organisms.

Embolism plays an important part in determining one form of gangrene, as has already been described. Infective emboli are the direct cause of the secondary abscesses that occur in pyaemia; and they are sometimes responsible for the formation of aneurysm.

Portions of malignant tumours also may form emboli, and their impaction in the vessels may lead to the development of secondary growths in distant parts of the body.

Fat and air embolism have already been referred to.

ARTERITIS

Pyogenic.--Non-suppurative inflammation of the coats of an artery may so soften the wall of the vessel as to lead to aneurysmal dilatation. It is not uncommon in children, and explains the occurrence of aneurysm in young subjects.

When suppuration occurs, the vessel wall becomes disintegrated and gives way, leading to secondary haemorrhage. If the vessel ruptures into an abscess cavity, dangerous bleeding may occur when the abscess bursts or is opened.

Syphilitic. --The inflammation associated with syphilis results in thickening of the tunica intima, whereby the lumen of the vessel becomes narrowed, or even obliterated--endarteritis obliterans. The middle coat usually escapes, but the tunica externa is generally thickened. These changes cause serious interference with the nutrition of the parts supplied by the affected arteries. In large trunks, by diminishing the elasticity of the vessel wall, they are liable to lead to the formation of aneurysm.

Changes in the arterial walls closely resembling those of syphilitic arteritis are sometimes met with in tuberculous lesions.

#Arterio-sclerosis# or #Chronic Arteritis#. --These terms are applied to certain changes which result in narrowing of the lumen and loss of elasticity in the arteries. The condition may affect the whole vascular system or may be confined to particular areas. In the smaller arteries there is more or less uniform thickening of the tunica intima from proliferation of the endothelium and increase in the connective tissue in the elastic lamina--a form of obliterative endarteritis. The narrowing of the vessels may be sufficient to determine gangrene in the extremities. In course of time, particularly in the larger arteries, this new tissue undergoes degeneration, at first of a fatty nature, but progressing in the direction of calcification, and this is followed by the deposit of lime salts in the young connective tissue and the formation of calcareous plates or rings over a considerable area of the vessel wall. To this stage in the process the term atheroma is applied. The endothelium over these plates often disappears, leaving them exposed to the blood-stream.

Changes of a similar kind sometimes occur in the middle coat, the lime salts being deposited among the muscle fibres in concentric rings.

The primary cause of arterio-sclerosis is not definitely known, but its almost constant occurrence, to a greater or less degree, in the aged suggests that it is of the nature of a senile degeneration. It is favoured by anything which throws excessive strain on the vessel walls, such as heavy muscular work; by chronic alcoholism and syphilis; or by such general diseases as tend to raise the blood-pressure--for example, chronic Bright's disease or gout. It occurs with greater frequency and with greater severity in men than in women.

Atheromatous degeneration is most common in the large arterial trunks, and the changes are most marked at the arch of the aorta, opposite the flexures of joints, at the mouths of large branches, and at parts where the vessel lies in contact with bone. The presence of diseased patches in the wall of an artery diminishes its elasticity and favours aneurysmal dilatation. Such a vessel also is liable to be ruptured by external violence and so give rise to traumatic aneurysm. Thrombosis is liable to occur when calcareous plates are exposed in the lumen of the vessel by destruction of the endothelium, and this predisposes to embolism. Arterio-sclerosis also interferes with the natural arrest of haemorrhage, and by rendering the vessels brittle, makes it difficult to secure them by ligature. In advanced cases the accessible arteries--such as the radial, the temporal or the femoral--may be felt as firm, tortuous cords, which are sometimes so hard that they have been aptly compared to "pipe-stems." The pulse is smaller and less compressible than normal, and the vessel moves bodily with each pulsation. It must be borne in mind, however, that the condition of the radial artery may fail to afford a clue to that of the larger arteries. Calcified arteries are readily identified in skiagrams (Fig. 65).

[Illustration: FIG. 65.--Radiogram showing Calcareous Degeneration (Atheroma) of Arteries.]

We have met with a chronic form of arterial degeneration in elderly women, affecting especially the great vessels at the root of the neck, in which the artery is remarkably attenuated and dilated, and so friable that the wall readily tears when seized with an artery-forceps, rendering ligation of the vessel in the ordinary way well-nigh

impossible. Matas suggests infolding the wall of the vessel with interrupted sutures that do not pierce the intima, and wrapping it round with a strip of peritoneum or omentum.

The most serious form of arterial thrombosis is that met with in the abdominal aorta, which is attended with violent pains in the lower limbs, rapidly followed by paralysis and arrest of the circulation.

THROMBO-PHLEBITIS AND THROMBOSIS IN VEINS

#Thrombosis# is more common in veins than in arteries, because slowing of the blood-stream and irritation of the endothelium of the vessel wall are, owing to the conditions of the venous circulation, more readily induced in veins.

Venous thrombosis may occur from purely mechanical causes--as, for example, when the wall of a vein is incised, or the vessel included in a ligature, or when it is bruised or crushed by a fragment of a broken bone or by a bandage too tightly applied. Under these conditions thrombosis is essentially a reparative process, and has already been considered in relation to the repair of blood vessels.

In other cases thrombosis is associated with certain constitutional diseases--gout, for example; the endothelium of the veins undergoing changes--possibly the result of irritation by abnormal constituents in the blood--which favour the formation of thrombi.

Under these various conditions the formation of a thrombus is not necessarily associated with the action of bacteria, although in any of them this additional factor may be present.

The most common cause of venous thrombosis, however, is inflammation of the wall of the vein--phlebitis.

#Phlebitis.#--Various forms of phlebitis are met with, but for practical purposes they may be divided into two groups--one in which there is a tendency to the formation of a thrombus; the other in which the infective element predominates.

In surgical patients, the thrombotic form is almost invariably met with in the lower extremity, and usually occurs in those who are debilitated and anaemic, and who are confined to bed for prolonged periods--for example, during the treatment of fractures of the leg or pelvis, or after such operations as herniotomy, prostatectomy, or appendectomy.

Clinical Features.--The most typical example of this form of phlebitis is that so frequently met with in the great saphena vein, especially when it is varicose. The onset of the attack is indicated by a sudden pain in the lower limb--sometimes below, sometimes above the knee. This initial pain may be associated with shivering or even with a rigor, and the temperature usually rises one or two degrees. There is swelling and tenderness along the line of the affected vein, and the skin over it is a dull-red or purple colour. The swollen vein may be felt as a firm cord, with bead-like enlargements in the position of the valves. The patient experiences a feeling of stiffness and tightness throughout the limb. There is often oedema of the leg and foot, especially when the limb is in the dependent position. The acute symptoms pass off in a few days, but the swelling and tenderness of the vein and the oedema of the limb may last for many weeks.

When the deep veins--iliac, femoral, popliteal--are involved, there is great swelling of the whole limb, which is of a firm almost "wooden" consistence, and of a pale-white colour; the oedema may be so great that it is impossible to feel the affected vein until the swelling has subsided. This is most often seen in puerperal women, and is known as phlegmasia alba dolens.

Treatment.--The patient must be placed at absolute rest, with the foot

of the bed raised on blocks 10 or 12 inches high, and the limb immobilised by sand-bags or splints. It is necessary to avoid handling the parts, lest the clot be displaced and embolism occur. To avoid frequent movement of the limb, the necessary dressings should be kept in position by means of a many-tailed rather than a roller bandage.

To relieve the pain, warm fomentations or lead and opium lotion should be applied. Later, ichthyol-glycerin, or glycerin and belladonna, may be substituted.

When, at the end of three weeks, the danger of embolism is past, douching and gentle massage may be employed to disperse the oedema; and when the patient gets up he should wear a supporting elastic bandage.

The infective form usually begins as a peri-phlebitis arising in connection with some focus of infection in the adjacent tissues. The elements of the vessel wall are destroyed by suppuration, and the thrombus in its lumen becomes infected with pyogenic bacteria and undergoes softening.

Occlusion of the inferior vena cava as a result of infective thrombosis is a well-known condition, the thrombosis extending into the main trunk from some of its tributaries, either from the femoral or iliac veins below or from the hepatic veins above.

Portions of the softened thrombus are liable to become detached and to enter the circulating blood, in which they are carried as emboli. These may lodge in distant parts, and give rise to secondary foci of suppuration--pyaemic abscesses.

Clinical Features.--Infective phlebitis is most frequently met with in the transverse sinus as a sequel to chronic suppuration in the mastoid antrum and middle ear. It also occurs in relation to the peripheral veins, but in these it can seldom be recognised as a separate entity, being merged in the general infective process from which it takes origin. Its occurrence may be inferred, if in the course of a suppurative lesion there is a sudden rise of temperature, with pain, redness, and swelling along the line of a venous trunk, and a rapidly developed oedema of the limb, with pitting of the skin on pressure. In rare cases a localised abscess forms in the vein and points towards the surface.

Treatment.--Attention must be directed towards the condition with which the phlebitis is associated. Ligation of the vein on the cardiac side of the thrombus with a view to preventing embolism is seldom feasible in the peripheral veins, although, as will be pointed out later, the jugular vein is ligated with this object in cases of phlebitis of the transverse sinus.

VARIX--VARICOSE VEINS

The term varix is applied to a condition in which veins are so altered in structure that they remain permanently dilated, and are at the same time lengthened and tortuous. Two types are met with: one in which dilatation of a large superficial vein and its tributaries is the most obvious feature; the other, in which bunches of distended and tortuous vessels develop at one or more points in the course of a vein, a condition to which Virchow applied the term angioma racemosum venosum. The two types may occur in combination.

Any vein in the body may become varicose, but the condition is rare except in the veins of the lower extremity, in the veins of the spermatic cord (varicocele), and in the veins of the anal canal (haemorrhoids).

We are here concerned with varix as it occurs in the veins of the lower extremity.

Etiology.--Considerable difference of opinion exists as to the

essential cause of varix. The weight of evidence is in favour of the view that, when dilatation is the predominant element, it results from a congenital deficiency in the number, size, and strength of the valves of the affected veins, and in an inherent weakness in the vessel walls. The angioma racemosum venosum is probably also due to a congenital alteration in the structure of the vessels, and is allied to tumours of blood vessels. The view that varix is congenital in origin, as was first suggested by Virchow, is supported by the fact that in a large proportion of cases the condition is hereditary; not only may several members of the same family in succeeding generations suffer from varix, but it is often found that the same vein, or segment of a vein, is involved in all of them. The frequent occurrence of varix in youth is also an indication of its congenital origin.

In the majority of cases it is only when some exciting factor comes into operation that the clinical phenomena associated with varix appear. The most common exciting cause is increased pressure within the veins, and this may be produced in a variety of ways. In certain diseases of the heart, lungs, and liver, for example, the venous pressure may be so raised as to cause a localised dilatation of such veins as are congenitally weak. The direct pressure of a tumour, or of the gravid uterus on the large venous trunks in the pelvis, may so obstruct the flow as to distend the veins of the lower extremity. It is a common experience in women that the signs of varix date from an antecedent pregnancy. The importance of the wearing of tight garters as a factor in the production of varicose veins has been exaggerated, although it must be admitted that this practice is calculated to aggravate the condition when it is once established. It has been proved experimentally that the backward pressure in the veins may be greatly increased by straining, a fact which helps to explain the frequency with which varicosity occurs in the lower limbs of athletes and of those whose occupation involves repeated and violent muscular efforts. There is reason to believe, moreover, that a sudden strain may, by rupturing the valves and so rendering them incompetent, induce varicosity independently of any congenital defect. Prolonged standing or walking, by allowing gravity to act on the column of blood in the veins of the lower limbs, is also an important determining factor in the production of varix.

Thrombosis of the deep veins--in the leg, for example--may induce marked dilatation of the superficial veins, by throwing an increased amount of work upon them. This is to be looked upon rather as a compensatory hypertrophy of the superficial vessels than as a true varix.

Morbid Anatomy.--In the lower extremity the varicosity most commonly affects the vessels of the great saphena system; less frequently those of the small saphena system. Sometimes both systems are involved, and large communicating branches may develop between the two.

The essential lesion is the absence or deficiency of valves, so that they are incompetent and fail to support the column of blood which bears back upon them. Normally the valves in the femoral and iliac veins and in the inferior vena cava are imperfectly developed, so that in the erect posture the great saphena receives a large share of the backward pressure of the column of venous blood.

The whole length of the vein may be affected, but as a rule the disease is confined to one or more segments, which are not only dilated, but are also increased in length, so that they become convoluted. The adjacent loops of the convoluted vein are often bound together by fibrous tissue. All the coats are thickened, chiefly by an increased development of connective tissue, and in some cases changes similar to those of arterio-sclerosis occur. The walls of varicose veins are often exceedingly brittle. In some cases the thickening is uniform, and in others it is irregular, so that here and there thin-walled sacs or pouches project from the side of the vein. These pouches vary in size from a bean to a hen's egg, the larger forms being called venous cysts, and being most commonly met with in the region of the saphenous opening and of the opening in the popliteal fascia. Such pouches, being exposed to injury, are frequently the seat of thrombosis (Fig. 66).

[Illustration: FIG. 66.--Thrombosis in Tortuous and Pouched Great Saphena Vein, in longitudinal section.]

Clinical Features.--Varix is most frequently met with between puberty and the age of thirty, and the sexes appear to suffer about equally.

The amount of discomfort bears no direct proportion to the extent of the varicosity. It depends rather upon the degree of pressure in the veins, as is shown by the fact that it is relieved by elevation of the limb. When the whole length of the main trunk of the great saphena is implicated, the pressure in the vein is high and the patient suffers a good deal of pain and discomfort. When, on the contrary, the upper part of the saphena and its valves are intact, and only the more distal veins are involved, the pressure is not so high and there is comparatively little suffering. The usual complaint is of a sense of weight and fulness in the limb after standing or walking, sometimes accompanied by actual pain, from which relief is at once obtained by raising the limb. Cramp-like pains in the muscles are often associated with varix of the deep veins.

The dilated and tortuous vein can be readily seen and felt when the patient is examined in the upright posture. In advanced cases, bead-like swellings are sometimes to be detected over the position of the valves, and, on running the fingers along the course of the vessel, a firm ridge, due to periphlebitis, may be detected on each side of the vein. When the limb is oedematous, the outline of the veins is obscured, but they can be identified on palpation as gutter-like tracks. When large veins are implicated, a distinct impulse on coughing may be seen to pass down as far as the knee; and if the vessel is sharply percussed a fluid wave may be detected passing both up and down the vein.

If the patient is placed on a couch and the limb elevated, the veins are emptied, and if pressure is then made over the region of the saphenous opening and the patient allowed to stand up, so long as the great saphena system alone is involved, the veins fill again very slowly from below. If the small saphena system also is involved, and if communicating branches are dilated, the veins fill up from below more rapidly. When the pressure over the saphenous opening is removed, the blood rapidly rushes into the varicose vessels from above; this is known as Trendelenburg's test.

The most marked dilatation usually occurs on the medial side of the limb, between the middle of the thigh and the middle of the calf, the arrangement of the veins showing great variety (Fig. 67).

There are usually one or more bunches of enlarged and tortuous veins in the region of the knee. Frequently a large branch establishes a communication between the systems of the great and small saphenous veins in the region of the popliteal space, or across the front of the upper part of the tibia. The superficial position of this last branch and its proximity to the bone render it liable to injury.

[Illustration: FIG. 67.--Extensive Varix of Internal Saphena System on Left Leg, of many years' standing.]

The small veins of the skin of the ankle and foot often show as fine blue streaks arranged in a stellate or arborescent manner, especially in women who have borne children.

Complications.--When the varix is of long standing, the skin in the lower part of the leg sometimes assumes a mahogany-brown or bluish hue, as a result of the deposit of blood pigment in the tissues, and this is frequently a precursor of ulceration.

Chronic dermatitis (varicose eczema) is often met with in the lower part of the leg, and is due to interference with the nutrition of the skin. The incompetence of the valves allows the pressure in the varicose veins to equal that in the arterioles, so that the capillary circulation is impeded. From the same cause the blood in the deep veins is enabled to enter the superficial veins, where the backward pressure is so great

that the blood flows down again, and so a vicious circle is established. The blood therefore loses more and more of its oxygen, and so fails to nourish the tissues.

The ulcer of the leg associated with varicose veins has already been described.

Haemorrhage may take place from a varicose vein as a result of a wound or of ulceration of its wall. Increased intra-venous pressure produced by severe muscular strain may determine rupture of a vein exposed in the floor of an ulcer. If the limb is dependent, the incompetency of the valves permits of rapid and copious bleeding, which may prove fatal, particularly if the patient is intoxicated when the rupture takes place and no means are taken to arrest the haemorrhage. The bleeding may be arrested at once by elevating the limb, or by applying pressure directly over the bleeding point.

Phlebitis and thrombosis are common sequelae of varix, and may prove dangerous, either by spreading into the large venous trunks or by giving rise to emboli. The larger the varix the greater is the tendency for a thrombus to spread upwards and to involve the deep veins. Thrombi usually originate in venous cysts or pouches, and at acute bends on the vessel, especially when these are situated in the vicinity of the knee, and are subjected to repeated injuries--for example in riding. Phleboliths sometimes form in such pouches, and may be recognised in a radiogram. In a certain proportion of cases, especially in elderly people, the occurrence of thrombosis leads to cure of the condition by the thrombus becoming organised and obliterating the vein.

Treatment.--At best the treatment of varicose veins is only palliative, as it is obviously impossible to restore to the vessels their normal structure. The patient must avoid wearing anything, such as a garter, which constricts the limb, and any obvious cause of direct pressure on the pelvic veins, such as a tumour, persistent constipation, or an ill-fitting truss, should be removed. Cardiac, renal, or pulmonary causes of venous congestion must also be treated, and the functions of the liver regulated. Severe forms of muscular exertion and prolonged standing or walking are to be avoided, and the patient may with benefit rest the limb in an elevated position for a few hours each day. To support the distended vessels, a closely woven silk or worsted stocking, or a light and porous form of elastic bandage, applied as a puttee, should be worn. These appliances should be put on before the patient leaves his bed in the morning, and should only be removed after he lies down at night. In this way the vessels are never allowed to become dilated. Elastic stockings, and bandages made entirely of india-rubber, are to be avoided. In early and mild cases these measures are usually sufficient to relieve the patient's discomfort.

Operative Treatment.--In aggravated cases, when the patient is suffering pain, when his occupation is interfered with by repeated attacks of phlebitis, or when there are large pouches on the veins, operative treatment is called for. The younger the patient the clearer is the indication to operate. It may be necessary to operate to enable a patient to enter one of the public services, even although no symptoms are present. The presence of an ulcer does not contra-indicate operation; the ulcer should be excised, and the raw surface covered with skin grafts, before dealing with the veins.

The operation of Trendelenburg is especially appropriate to cases in which the trunk of the great saphena vein in the thigh is alone involved. It consists in exposing three or four inches of the vein in its upper part, applying a ligature at the upper and lower ends of the exposed portion, and, after tying all tributary branches, resecting this portion of the vein.

The procedure of C. H. Mayo is adapted to cases in which it is desirable to remove longer segments of the veins. It consists in the employment of special instruments known as "ring-enucleators" or "vein-strippers," by means of which long portions of the vein are removed through comparatively small incisions.

An alternative procedure consists in avulsing segments of the vein by means of Babcock's stylet, which consists of a flexible steel rod, 30 inches in length, with acorn-shaped terminals. The instrument is passed along the lumen of the segment to be dealt with, and a ligature applied around the vein above the bulbous end of the stylet enables nearly the whole length of the great saphena vein to be dragged out in one piece. These methods are not suitable when the veins are brittle, when there are pouches or calcareous deposits in their walls, or where there has been periphlebitis binding the coils together.

Mitchell of Belfast advises exposing the varices at numerous points by half-inch incisions, and, after clamping the vein between two pairs of forceps, cutting it across and twisting out the segments of the vein between adjacent incisions. The edges of the incisions are sutured; and the limb is firmly bandaged from below upwards, and kept in an elevated position. We have employed this method with satisfactory results.

The treatment of the complications of varix has already been considered.

ANGIOMA[4]

[4] In the description of angiomas we have followed the teaching of the late John Duncan.

Tumours of blood vessels may be divided, according to the nature of the vessels of which they are composed, into the capillary, the venous, and the arterial angiomas.

CAPILLARY ANGIOMA

The most common form of capillary angioma is the naevus or congenital telangiectasis.

#Naevus.#--A naevus is a collection of dilated capillaries, the afferent arterioles and the efferent venules of which often share in the dilatation. Little is known regarding the etiology of naevi beyond the fact that they are of congenital origin. They often escape notice until the child is some days old, but attention is usually drawn to them within a fortnight of birth. For practical purposes the most useful classification of naevi is into the cutaneous, the subcutaneous, and the mixed forms.

The cutaneous naevus, "mother's mark," or "port-wine stain," consists of an aggregation of dilated capillaries in the substance of the skin. On stretching the skin the vessels can be seen to form a fine network, or to run in leashes parallel to one another. A dilated arteriole or a vein winding about among the capillaries may sometimes be detected. These naevi occur on any part of the body, but they are most frequently met with on the face. They may be multiple, and vary greatly in size, some being no bigger than a pin-head, while others cover large areas of the body. In colour they present every tint from purple to brilliant red; in the majority there is a considerable dash of blue, especially in cold weather.

Unlike the other forms of naevi, the cutaneous variety shows little tendency to disappear, and it is especially persistent when associated with overgrowth of the epidermis and of the hairs--_naevoid mole_.

The treatment of the cutaneous naevus is unsatisfactory, owing to the difficulty of removing the naevus without leaving a scar which is even more disfiguring. Very small naevi may be destroyed by a fine pointed Paquelin thermo-cautery, or by escharotics, such as nitric acid. For larger naevi, radium and solidified carbon dioxide ("CO₂ snow") may be used. The extensive port-wine stains so often met with on the face are best left alone.

The subcutaneous naevus is comparatively rare. It constitutes a

well-defined, localised tumour, which may possess a distinct capsule, especially when it has ceased to grow or is retrogressing. On section, it presents the appearance of a finely reticulated sponge.

Although it may be noticed at, or within a few days of, birth, a subcutaneous naevus is often overlooked, especially when on a covered part of the body, and may not be discovered till the patient is some years old. It forms a rounded, lobulated swelling, seldom of large size and yielding a sensation like that of a sponge; the skin over it is normal, or may exhibit a bluish tinge, especially in cold weather. In some cases the tumour is diminished by pressing the blood out of it, but slowly fills again when the pressure is relaxed, and it swells up when the child struggles or cries. From a cold abscess it is diagnosed by the history and progress of the swelling and by the absence of fluctuation. When situated over one of the hernial openings, it closely simulates a hernia; and when it occurs in the middle line of the face, head, or back, it may be mistaken for such other congenital conditions as meningocele or spina bifida. When other means fail, the use of an exploring needle clears up the diagnosis.

Mixed Naevus.--As its name indicates, the mixed naevus partakes of the characters of the other two varieties; that is, it is a subcutaneous naevus with involvement of the skin.

It is frequently met with on the face and head, but may occur on any part of the body. It also affects parts covered by mucous membrane, such as the cheek, tongue, and soft palate. The swelling is rounded or lobulated, and projects beyond the level of its surroundings. Sometimes the skin is invaded by the naevoid tissue over the whole extent of the tumour, sometimes only over a limited area. Frequently the margin only is of a bright-red colour, while the skin in the centre resembles a cicatrix. The swelling is reduced by steady pressure, and increases in size and becomes tense when the child cries.

[Illustration: FIG. 68.--Mixed Naevus of Nose which was subsequently cured by Electrolysis.]

Prognosis.--The rate of growth of the subcutaneous and mixed forms of naevi varies greatly. They sometimes increase rapidly, especially during the first few months of life; after this they usually grow at the same rate as the child, or more slowly. There is a decided tendency to disappearance of these varieties, fully 50 per cent. undergoing natural cure by a process of obliteration, similar to the obliteration of vessels in cicatricial tissue. This usually begins about the period of the first dentition, sometimes at the second dentition, and sometimes at puberty. On the other hand, an increased activity of growth may be shown at these periods. The onset of natural cure is recognised by the tumour becoming firmer and less compressible, and, in the mixed variety, by the colour becoming less bright. Injury, infection, or ulceration of the overlying skin may initiate the curative process.

Towards adult life the spaces in a subcutaneous naevus may become greatly enlarged, leading to the formation of a cavernous angioma.

Treatment.--In view of the frequency with which subcutaneous and mixed naevi disappear spontaneously, interference is only called for when the growth of the tumour is out of proportion to that of the child, or when, from its situation--for example in the vicinity of the eye--any marked increase in its size would render it less amenable to treatment.

The methods of treatment most generally applicable are the use of radium and carbon dioxide snow, igni-puncture, electrolysis, and excision.

For naevi situated on exposed parts, where it is desirable to avoid a scar, the use of radium is to be preferred. The tube of radium is applied at intervals to different parts of the naevus, the duration and frequency of the applications varying with the strength of the emanations and the reaction produced. The object aimed at is to induce obliteration of the naevoid tissue by cicatricial contraction without destroying the overlying skin. Carbon-dioxide snow may be employed in

the same manner, but the results are inferior to those obtained by radium.

Igni-puncture consists in making a number of punctures at different parts of the naevus with a fine-pointed thermo-cautery, with the object of starting at each point a process of cicatrisation which extends throughout the naevous tissue and so obliterates the vessels.

Electrolysis acts by decomposing the blood and tissues into their constituent elements--oxygen and acids appearing at the positive, hydrogen and bases at the negative electrode. These substances and gases being given off in a nascent condition, at once enter into new combinations with anything in the vicinity with which they have a chemical affinity. In the naevus the practical result of this reaction is that at the positive pole nitric acid, and at the negative pole caustic potash, both in a state of minute subdivision, make their appearance. The effect on the tissues around the positive pole, therefore, is equivalent to that of an acid cauterisation, and on those round the negative pole, to an alkaline cauterisation.

As the process is painful, a general anaesthetic is necessary. The current used should be from 20 to 80 milliamperes, gradually increasing from zero, without shock; three to six large Bunsen cells give a sufficient current, and no galvanometer is required. Steel needles, insulated with vulcanite to within an eighth of an inch of their points, are the best. Both poles are introduced into the naevus, the positive being kept fixed at one spot, while the negative is moved about so as to produce a number of different tracks of cauterisation. On no account must either pole be allowed to come in contact with the skin, lest a slough be formed. The duration of the sitting is determined by the effect produced, as indicated by the hardening of the tumour, the average duration being from fifteen to twenty minutes. If pallor of the skin appears, it indicates that the needles are too near the surface, or that the blood supply to the integument is being cut off, and is an indication to stop. To cauterise the track and so prevent bleeding, the needles should be slowly withdrawn while the current is flowing. When the skin is reached the current is turned off. The punctures are covered with collodion. Six or eight weeks should be allowed to elapse before repeating the procedure. From two to eight or ten sittings may be necessary, according to the size and character of the naevus.

Excision is to be preferred for naevi of moderate size situated on covered parts of the body, where a scar is of no importance. Its chief advantages over electrolysis are that a single operation is sufficient, and that the cure is speedy and certain. The operation is attended with much less haemorrhage than might be expected.

#Cavernous Angioma.#--This form of angioma consists of a series of large blood spaces which are usually derived from the dilatation of the capillaries of a subcutaneous naevus. The spaces come to communicate freely with one another by the disappearance of adjacent capillary walls. While the most common situation is in the subcutaneous tissue, a cavernous angioma is sometimes met with in internal organs. It may appear at any age from early youth to middle life, and is of slow growth and may become stationary. The swelling is rounded or oval, there is no pulsation or bruit, and the tumour is but slightly compressible. The treatment consists in dissecting it out.

#Aneurysm by Anastomosis# is the name applied to a vascular tumour in which the arteries, veins, and capillaries are all involved. It is met with chiefly on the upper part of the trunk, the neck, and the scalp. It tends gradually to increase in size, and may, after many years, attain an enormous size. The tumour is ill-defined, and varies in consistence. It is pulsatile, and a systolic bruit or a "thrilling" murmur may be heard over it. The chief risk is haemorrhage from injury or ulceration.

[Illustration: FIG. 69.--Cirsoid Aneurysm of Forehead in a boy aet. 10.

(Mr. J. W. Dowden's case.)]

The treatment is conducted on the same lines as for naevus. When electrolysis is employed, it should be directed towards the afferent vessels; and if it fails to arrest the flow through these, it is useless to persist with it. In some cases ligation of the afferent vessels has been successful.

#Arterial Angioma# or #Cirsoid Aneurysm#.--This is composed of the enlarged branches of an arterial trunk. It originates in the smaller branches of an artery--usually the temporal--and may spread to the main trunk, and may even involve branches of other trunks with which the affected artery anastomoses.

The condition is probably congenital in origin, though its appearance is frequently preceded by an injury. It almost invariably occurs in the scalp, and is usually met with in adolescent young adults.

The affected vessels slowly increase in size, and become tortuous, with narrowings and dilatations here and there. Grooves and gutters are frequently found in the bone underlying the dilated vessels.

There is a constant loud bruit in the tumour, which greatly troubles the patient and may interfere with sleep. There is no tendency either to natural cure or to rupture, but severe and even fatal haemorrhage may follow a wound of the dilated vessels.

[Illustration: FIG. 70.--Cirsoid Aneurysm of Orbit and Face, which developed after a blow on the Orbit with a cricket ball.

(From a photograph lent by Sir Montagu Cotterill.)]

The condition may be treated by excision or by electrolysis. In excision the haemorrhage is controlled by an elastic tourniquet applied horizontally round the head, or by ligation of the feeding trunks. In large tumours the bleeding is formidable. In many cases electrolysis is to be preferred, and is performed in the same way as for naevus. The positive pole is placed in the centre of the tumour, while the negative is introduced into the main affluents one after another.

ANEURYSM

An aneurysm is a sac communicating with an artery, and containing fluid or coagulated blood.

Two types are met with--the pathological and the traumatic. It is convenient to describe in this section also certain conditions in which there is an abnormal communication between an artery and a vein--arterio-venous aneurysm.

PATHOLOGICAL ANEURYSM

In this class are included such dilatations as result from weakening of the arterial coats, combined, in most cases, with a loss of elasticity in the walls and increase in the arterial tension due to arterio-sclerosis. In some cases the vessel wall is softened by arteritis--especially the embolic form--so that it yields before the pressure of the blood.

Repeated and sudden raising of the arterial tension, as a result, for example, of violent muscular efforts or of excessive indulgence in alcohol, plays an important part in the causation of aneurysm. These factors probably explain the comparative frequency of aneurysm in those who follow such arduous occupations as soldiers, sailors, dock-labourers, and navvies. In these classes the condition usually manifests itself between the ages of thirty and fifty--that is, when the vessels are beginning to degenerate, although the heart is still vigorous and the men are hard at work. The comparative immunity of women may also be explained by the less severe muscular strain involved by their occupations and recreations.

Syphilis plays an important part in the production of aneurysm, probably by predisposing the patient to arterio-sclerosis and atheroma, and inducing an increase in the vascular tension in the peripheral vessels, from loss of elasticity of the vessel wall and narrowing of the lumen as a result of syphilitic arteritis. It is a striking fact that aneurysm is seldom met with in women who have not suffered from syphilis.

#Varieties--Fusiform Aneurysm.--When the whole circumference of an artery has been weakened, the tension of the blood causes the walls to dilate uniformly, so that a fusiform or tubular aneurysm results. All the coats of the vessel are stretched and form the sac of the aneurysm, and the affected portion is not only dilated but is also increased in length. This form is chiefly met with in the arch of the aorta, but may occur in any of the main arterial trunks. As the sac of the aneurysm includes all three coats, and as the inner and outer coats are usually thickened by the deposit in them of connective tissue, this variety increases in size slowly and seldom gives rise to urgent symptoms.

As a rule a fusiform aneurysm contains fluid blood, but when the intima is roughened by disease, especially in the form of calcareous plates, shreds of clot may adhere to it.

It has little tendency to natural cure, although this is occasionally effected by the emerging artery becoming occluded by a clot; it has also little tendency to rupture.

#Sacculated Aneurysm.--When a limited area of the vessel wall is weakened--for example by atheroma or by other form of arteritis--this portion yields before the pressure of the blood, and a sacculated aneurysm results. The internal and middle coats being already damaged, or, it may be, destroyed, by the primary disease, the stress falls on the external coat, which in the majority of cases constitutes the sac. To withstand the pressure the external coat becomes thickened, and as the aneurysm increases in size it forms adhesions to surrounding tissues, so that fasciae, tendons, nerves, and other structures may be found matted together in its wall. The wall is further strengthened by the deposit on its inner aspect of blood-clot, which may eventually become organised.

The contents of the sac consist of fluid blood and a varying amount of clot which is deposited in concentric layers on the inner aspect of the sac, where it forms a pale, striated, firm mass, which constitutes a laminated clot. Near the blood-current the clot is soft, red, and friable (Fig. 72). The laminated clot not only strengthens the sac, enabling it to resist the blood-pressure and so prevent rupture, but, if it increases sufficiently to fill the cavity, may bring about cure. The principle upon which all methods of treatment are based is to imitate nature in producing such a clot.

Sacculated aneurysm, as compared with the fusiform variety, tends to rupture and also to cure by the formation of laminated clot; natural cure is sometimes all but complete when extension and rupture occur and cause death.

An aneurysm is said to be diffused when the sac ruptures and the blood escapes into the cellular tissue.

#Clinical Features of Aneurysm.--Surgically, the sacculated is by far the most important variety. The outstanding feature is the existence in the line of an artery of a globular swelling, which pulsates. The pulsation is of an expansile character, which is detected by observing that when both hands are placed over the swelling they are separated with each beat of the heart. If the main artery be compressed on the cardiac side of the swelling, the pulsation is arrested and the tumour becomes smaller and less tense, and it may be still further reduced in size by gentle pressure being made over it so as to empty it of fluid blood. On allowing the blood again to flow through the artery, the pulsation returns at once, but several beats are required before the sac regains its former size. In most cases a distinct thrill is felt on

placing the hand over the swelling, and a blowing, systolic murmur may be heard with the stethoscope. It is to be borne in mind that occasionally, when the interchange of blood between an aneurysm and the artery from which it arises is small, pulsation and bruit may be slight or even absent. This is also the case when the sac contains a considerable quantity of clot. When it becomes filled with clot--_consolidated aneurysm--these signs disappear, and the clinical features are those of a solid tumour lying in contact with an artery, and transmitting its pulsation.

A comparison of the pulse in the artery beyond the seat of the aneurysm with that in the corresponding artery on the healthy side, shows that on the affected side the wave is smaller in volume, and delayed in time. A pulse tracing shows that the normal impulse and dicrotic waves are lost, and that the force and rapidity of the tidal wave are diminished.

[Illustration: FIG. 71.--Radiogram of Aneurysm of Aorta, showing laminated clot and erosion of bodies of vertebrae. The intervertebral discs are intact.]

An aneurysm exerts pressure on the surrounding structures, which are usually thickened and adherent to it and to one another. Adjacent veins may be so compressed that congestion and oedema of the parts beyond are produced. Pain, disturbances of sensation, and muscular paryses may result from pressure on nerves. Such bones as the sternum and vertebrae undergo erosion and are absorbed by the gradually increasing pressure of the aneurysm. Cartilage, on the other hand, being elastic, yields before the pressure, so that the intervertebral discs or the costal cartilages may escape while the adjacent bones are destroyed (Fig. 71). The skin over the tumour becomes thinned and stretched, until finally a slough forms, and when it separates haemorrhage takes place.

[Illustration: FIG. 72.--Sacculated Aneurysm of Abdominal Aorta nearly filled with laminated clot. Note greater density of clot towards periphery.]

In the progress of an aneurysm towards rupture, timely clotting may avert death for the moment, but while extension in one direction has been arrested there is apt to be extension in another, with imminence of rupture, or it may be again postponed.

#Differential Diagnosis.#--The diagnosis is to be made from other pulsatile swellings. Pulsation is sometimes transmitted from a large artery to a tumour, a mass of enlarged lymph glands, or an inflammatory swelling which lies in its vicinity, but the pulsation is not expansile--a most important point in differential diagnosis. Such swellings may, by appropriate manipulation, be moved from the artery and the pulsation ceases, and compression of the artery on the cardiac side of the swelling, although it arrests the pulsation, does not produce any diminution in the size or tension of the swelling, and when the pressure is removed the pulsation is restored immediately.

Fluid swellings overlying an artery, such as cysts, abscesses, or enlarged bursae, may closely simulate aneurysm. An apparent expansion may accompany the pulsation, but careful examination usually enables this to be distinguished from the true expansion of an aneurysm. Compression of the artery makes no difference in the size or tension of the swelling.

Vascular tumours, such as sarcoma and goitre, may yield an expansile pulsation and a soft, whiffling bruit, but they differ from an aneurysm in that they are not diminished in size by compression of the main artery, nor can they be emptied by pressure.

The exaggerated pulsation sometimes observed in the abdominal aorta, the "pulsating aorta" seen in women, should not be mistaken for aneurysm.

#Prognosis.#--When natural cure occurs it is usually brought about by the formation of laminated clot, which gradually increases in amount till it fills the sac. Sometimes a portion of the clot in the sac is separated and becomes impacted as an embolus in the artery beyond,

leading to thrombosis which first occludes the artery and then extends into the sac.

The progress of natural cure is indicated by the aneurysm becoming smaller, firmer, less expansile, and less compressible; the murmur and thrill diminish and the pressure effects become less marked. When the cure is complete the expansile pulsation is lost, and there remains a firm swelling attached to the vessel (consolidated aneurysm). While these changes are taking place the collateral arteries become enlarged, and an anastomotic circulation is established.

An aneurysm may prove fatal by exerting pressure on important structures, by causing syncope, by rupture, or from the occurrence of suppuration. Pressure symptoms are usually most serious from aneurysms situated in the neck, thorax, or skull. Sudden fatal syncope is not infrequent in cases of aneurysm of the thoracic aorta.

Rupture may take place through the skin, on a mucous or serous surface, or into the cellular tissue. The first haemorrhage is often slight and stops naturally, but it soon recurs, and is so profuse, especially when the blood escapes externally, that it rapidly proves fatal. When the bleeding takes place into the cellular tissue, the aneurysm is said to become diffused, and the extravasated blood spreads widely through the tissues, exerting great pressure on the surrounding structures.

The clinical features associated with rupture are sudden and severe pain in the part, and the patient becomes pale, cold, and faint. If a comparatively small escape of blood takes place into the tissues, the sudden alteration in the size, shape, and tension of the aneurysm, together with loss of pulsation, may be the only local signs. When the bleeding is profuse, however, the parts beyond the aneurysm become greatly swollen, livid, and cold, and the pulse beyond is completely lost. The arrest of the blood supply may result in gangrene. Sometimes the pressure of the extravasated blood causes the skin to slough and, later, give way, and fatal haemorrhage results.

The treatment is carried out on the same lines as for a ruptured artery (p. 261), it being remembered, however, that the artery is diseased and does not lend itself to reconstructive procedures.

Suppuration may occur in the vicinity of an aneurysm, and the aneurysm may burst into the abscess which forms, so that when the latter points the pus is mixed with broken-down blood-clot, and finally free haemorrhage takes place. It has more than once happened that a surgeon has incised such an abscess without having recognised its association with aneurysm, with tragic results.

#Treatment.--In treating an aneurysm, the indications are to imitate Nature's method of cure by means of laminated clot.

Constitutional treatment consists in taking measures to reduce the arterial tension and to diminish the force of the heart's action. The patient must be kept in bed. A dry and non-stimulating diet is indicated, the quantity being gradually reduced till it is just sufficient to maintain nutrition. Saline purges are employed to reduce the vascular tension. The benefit derived from potassium iodide administered in full doses, as first recommended by George W. Balfour, probably depends on its depressing action on the heart and its therapeutic benefit in syphilis. Pain or restlessness may call for the use of opiates, of which heroin is the most efficient.

Local Treatment.--When constitutional treatment fails, local measures must be adopted, and many methods are available.

#Endo-aneurysmorrhaphy.--The operation devised by Rudolf Matas in 1888 aims at closing the opening between the sac and its feeding artery, and in addition, folding the wall of the sac in such a way as to leave no vacant space. If there is marked disease of the vessel, Matas' operation is not possible and recourse is then had to ligation of the artery just

above the sac.

Extirpation of the Sac--The Old Operation.--The procedure which goes by this name consists in exposing the aneurysm, incising the sac, clearing out the clots, and ligating the artery above and below the sac. This method is suitable to sacculated aneurysm of the limbs, so long as they are circumscribed and free from complications. It has been successfully practised also in aneurysm of the subclavian, carotid, and external iliac arteries. It is not applicable to cases in which there is such a degree of atheroma as would interfere with the successful ligation of the artery. The continuity of the artery may be restored by grafting into the gap left after excision of the sac a segment of the great saphena vein.

Ligation of the Artery.--The object of tying the artery is to diminish or to arrest the flow of blood through the aneurysm so that the blood coagulates both in the sac and in the feeding artery. The ligature may be applied on the cardiac side of the aneurysm--proximal ligation, or to the artery beyond--distal ligation.

Proximal Ligation.--The ligature may be applied immediately above the sac (Anel, 1710) or at a distance above (John Hunter, 1785). The Hunterian operation ensures that the ligature is applied to a part of the artery that is presumably healthy and where relations are undisturbed by the proximity of the sac; the best example is the ligation of the superficial femoral artery in Scarpa's triangle or in Hunter's canal for popliteal aneurysm; it is on record that Syme performed this operation with cure of the aneurysm on thirty-nine occasions.

It is to be noted that the Hunterian ligature does not aim at arresting the flow of blood through the sac, but is designed so to diminish its volume and force as to favour the deposition within the sac of laminated clot. The development of the collateral circulation which follows upon ligation of the artery at a distance above the sac may be attended with just that amount of return stream which favours the deposit of laminated clot, and consequently the cure of the aneurysm; the return stream may, however, be so forcible as to prevent coagulation of the blood in the sac, or only to allow of the formation of a red thrombus which may in its turn be dispersed so that pulsation in the sac recurs. This does not necessarily imply failure to cure, as the recurrent pulsation may only be temporary; the formation of laminated clot may ultimately take place and lead to consolidation of the aneurysm.

The least desirable result of the Hunterian ligature is met with in cases where, owing to widespread arterial disease, the collateral circulation does not develop and gangrene of the limb supervenes.

Anel's ligature is only practised as part of the operation which deals with the sac directly.

Distal Ligation.--The tying of the artery beyond the sac, or of its two branches where it bifurcates (Brasdor, 1760, and Wardrop, 1825), may arrest or only diminish the flow of blood through the sac. It is less successful than the proximal ligature, and is therefore restricted to aneurysms so situated as not to be amenable to other methods; for example, in aneurysm of the common carotid near its origin, the artery may be ligated near its bifurcation, or in aneurysm of the innominate artery, the carotid and subclavian arteries are tied at the seat of election.

Compression.--Digital compression of the feeding artery has been given up except as a preparation for operations on the sac with a view to favouring the development of a collateral circulation.

Macewen's acupuncture or "needling" consists in passing one or more fine, highly tempered steel needles through the tissues overlying the aneurysm, and through its outer wall. The needles are made to touch the opposite wall of the sac, and the pulsation of the aneurysm imparts a

movement to them which causes them to scarify the inner surface of the sac. White thrombus forms on the rough surface produced, and leads to further coagulation. The needles may be left in position for some hours, being shifted from time to time, the projecting ends being surrounded with sterile gauze.

The Moore-Corradi method consists in introducing through the wall of the aneurysm a hollow insulated needle, through the lumen of which from 10 to 20 feet of highly drawn silver or other wire is passed into the sac, where it coils up into an open meshwork (Fig. 73). The positive pole of a galvanic battery is attached to the wire, and the negative pole placed over the patient's back. A current, varying in strength from 20 to 70 milliamperes, is allowed to flow for about an hour. The hollow needle is then withdrawn, but the wire is left in situ. The results are somewhat similar to those obtained by needling, but the clot formed on the large coil of wire is more extensive.

[Illustration: FIG. 73---Radiogram of Innominate Aneurysm after treatment by the Moore-Corradi method. Two feet of finely drawn silver wire were introduced. The patient, a woman, aet. 47, lived for ten months after operation, free from pain (cf. Fig. 75).]

Colt's method of wiring has been mainly used in the treatment of abdominal aneurysm; gilt wire in the form of a wisp is introduced through the cannula and expands into an umbrella shape.

Subcutaneous Injections of Gelatin.--Three or four ounces of a 2 per cent. solution of white gelatin in sterilised water, at a temperature of about 100 ° F., are injected into the subcutaneous tissue of the abdomen every two, three, or four days. In the course of a fortnight or three weeks improvement may begin. The clot which forms is liable to soften and be absorbed, but a repetition of the injection has in several cases established a permanent cure.

Amputation of the limb is indicated in cases complicated by suppuration, by secondary haemorrhage after excision or ligation, or by gangrene. Amputation at the shoulder was performed by Fergusson in a case of subclavian aneurysm, as a means of arresting the blood-flow through the sac.

TRAUMATIC ANEURYSM

The essential feature of a traumatic aneurysm is that it is produced by some form of injury which divides all the coats of the artery. The walls of the injured vessel are presumably healthy, but they form no part of the sac of the aneurysm. The sac consists of the condensed and thickened tissues around the artery.

The injury to the artery may be a subcutaneous one such as a tear by a fragment of bone: much more commonly it is a punctured wound from a stab or from a bullet.

The aneurysm usually forms soon after the injury is inflicted; the blood slowly escapes into the surrounding tissues, gradually displacing and condensing them, until they form a sac enclosing the effused blood.

Less frequently a traumatic aneurysm forms some considerable time after the injury, from gradual stretching of the fibrous cicatrix by which the wound in the wall of the artery has been closed. The gradual stretching of this cicatrix results in condensation of the surrounding structures which form the sac, on the inner aspect of which laminated clot is deposited.

A traumatic aneurysm is almost always sacculated, and, so long as it remains circumscribed, has the same characters as a pathological sacculated aneurysm, with the addition that there is a scar in the overlying skin. A traumatic aneurysm is liable to become diffuse--a change which, although attended with considerable risk of gangrene, has sometimes been the means of bringing about a cure.

The treatment is governed by the same principles as apply to the pathological varieties, but as the walls of the artery are not diseased, operative measures dealing with the sac and the adjacent segment of the affected artery are to be preferred.

ARTERIO-VENOUS ANEURYSM

An abnormal communication between an artery and a vein constitutes an arterio-venous aneurysm. Two varieties are recognised--one in which the communication is direct--aneurysmal varix; the other in which the vein communicates with the artery through the medium of a sac--varicose aneurysm.

Either variety may result from pathological causes, but in the majority of cases they are traumatic in origin, being due to such injuries as stabs, punctured wounds, and gun-shot injuries which involve both artery and vein. In former times the most common situation was at the bend of the elbow, the brachial artery being accidentally punctured in blood-letting from the median basilic vein. Arterio-venous aneurysm is a frequent result of injuries by modern high-velocity bullets--for example, in the neck or groin.

In aneurysmal varix the higher blood pressure in the artery forces arterial blood into the vein, which near the point of communication with the artery tends to become dilated, and to form a thick-walled sac, beyond which the vessel and its tributaries are distended and tortuous. The clinical features resemble those associated with varicose veins, but the entrance of arterial blood into the dilated veins causes them to pulsate, and produces in them a vibratory thrill and a loud murmur. In those at the groin, the distension of the veins may be so great that they look like sinuses running through the muscles, a feature that must be taken into account in any operation.

As the condition tends to remain stationary, the support of an elastic bandage is all that is required; but when the condition progresses and causes serious inconvenience, it may be necessary to cut down and expose the communication between the artery and vein, and, after separating the vessels, to close the opening in each by suture; this may be difficult or impossible if the parts are matted from former suppuration. If it is impossible thus to obliterate the communication, the artery should be ligated above and below the point of communication; although the risk of gangrene is considerable unless means are taken to develop the collateral circulation beforehand (Makins).

Varicose aneurysm usually develops in relation to a traumatic aneurysm, the sac becoming adherent to an adjacent vein, and ultimately opening into it. In this way a communication between the artery and the vein is established, and the clinical features are those of a combination of aneurysm and aneurysmal varix.

As there is little tendency to spontaneous cure, and as the aneurysm is liable to increase in size and finally to rupture, operative treatment is usually called for. This is carried out on the same lines as for aneurysmal varix, and at the same time incising the sac, turning out the clots, and ligating any branches which open into the sac. If it can be avoided, the vein should not be ligated.

ANEURYSMS OF INDIVIDUAL ARTERIES

#Thoracic Aneurysm.#--All varieties of aneurysm occur in the aorta, the fusiform being the most common, although a sacculated aneurysm frequently springs from a fusiform dilatation.

The clinical features depend chiefly on the direction in which the aneurysm enlarges, and are not always well marked even when the sac is of considerable size. They consist in a pulsatile swelling--sometimes in the supra-sternal notch, but usually towards the right side of the

sternum--with an increased area of dulness on percussion. With the X-rays a dark shadow is seen corresponding to the sac. Pain is usually a prominent symptom, and is largely referable to the pressure of the aneurysm on the vertebrae or the sternum, causing erosion of these bones. Pressure on the thoracic veins and on the air-passage causes cyanosis and dyspnoea. When the oesophagus is pressed upon, the patient may have difficulty in swallowing. The left recurrent nerve may be stretched or pressed upon as it hooks round the arch of the aorta, and hoarseness of the voice and a characteristic "brassy" cough may result from paralysis of the muscles of the larynx which it supplies. The vagus, the phrenic, and the spinal nerves may also be pressed upon. When the aneurysm is on the transverse part of the arch, the trachea is pulled down with each beat of the heart--a clinical phenomena known as the "tracheal tug." Aneurysm of the descending aorta may, after eroding the bodies of the vertebrae (Fig. 71) and posterior portions of the ribs, form a swelling in the back to the left of the spine.

Inasmuch as obliteration of the sac and the feeding artery is out of the question, surgical treatment is confined to causing coagulation of the blood in an extension or pouching of the sac, which, making its way through the parietes of the chest, threatens to rupture externally. This may be achieved by MacEwen's needles or by the introduction of wire into the sac. We have had cases under observation in which the treatment referred to has been followed by such an amount of improvement that the patient has been able to resume a laborious occupation for one or more years. Christopher Heath found that improvement followed ligation of the left common carotid in aneurysm of the transverse part of the aortic arch.

[Illustration: FIG. 74.--Thoracic Aneurysm, threatening to rupture externally, but prevented from doing so by MacEwen's needling. The needles were left in for forty-eight hours.]

#Abdominal Aneurysm.#--Aneurysm is much less frequent in the abdominal than in the thoracic aorta. While any of the large branches in the abdomen may be affected, the most common seats are in the aorta itself, just above the origin of the coeliac artery and at the bifurcation.

The clinical features vary with the site of the aneurysm and with its rapidity and direction of growth. A smooth, rounded swelling, which exhibits expansile pulsation, forms, usually towards the left of the middle line. It may extend upwards under cover of the ribs, downwards towards the pelvis, or backward towards the loin. On palpation a systolic thrill may be detected, but the presence of a murmur is neither constant nor characteristic. Pain is usually present; it may be neuralgic in character, or may simulate renal colic. When the aneurysm presses on the vertebrae and erodes them, the symptoms simulate those of spinal caries, particularly if, as sometimes happens, symptoms of compression paraplegia ensue. In its growth the swelling may press upon and displace the adjacent viscera, and so interfere with their functions.

The diagnosis has to be made from solid or cystic tumours overlying the artery; from a "pulsating aorta"; and from spinal caries; much help is obtained by the use of the X-rays.

The condition usually proves fatal, either by the aneurysm bursting into the peritoneal cavity, or by slow leakage into the retro-peritoneal tissue.

The Moore-Corradi method has been successfully employed, access to the sac having been obtained by opening the abdomen. Ligation of the aorta has so far been unsuccessful, but in one case operated upon by Keen the patient survived forty-eight days.

#Innominate aneurysm# may be of the fusiform or of the sacculated variety, and is frequently associated with pouching of the aorta. It usually grows upwards and laterally, projecting above the sternum and right clavicle, which may be eroded or displaced (Fig. 75). Symptoms of pressure on the structures in the neck, similar to those produced by

aortic aneurysm, occur. The pulses in the right upper extremity and in the right carotid and its branches are diminished and delayed. Pressure on the right brachial plexus causes shooting pain down the arm and muscular paresis on that side. Vaso-motor disturbances and contraction of the pupil on the right side may result from pressure on the sympathetic. Death may take place from rupture, or from pressure on the air-passage.

[Illustration: FIG. 75.--Innominate Aneurysm in a woman, aet. 47, eight months after treatment by Moore-Corradi method (cf. Fig. 73).]

The available methods of treatment are ligation of the right common carotid and third part of the right subclavian (Wardrop's operation), of which a number of successful cases have been recorded. Those most suitable for ligation are cases in which the aneurysm is circumscribed and globular (Sheen). If ligation is found to be impracticable, the Moore-Corradi method or Macewen's needling may be tried.

#Carotid Aneurysms.---Aneurysm of the common carotid is more frequent on the right than on the left side, and is usually situated either at the root of the neck or near the bifurcation. It is the aneurysm most frequently met with in women. From its position the swelling is liable to press on the vagus, recurrent and sympathetic nerves, on the air-passage, and on the oesophagus, giving rise to symptoms referable to such pressure. There may be cerebral symptoms from interference with the blood supply of the brain.

Aneurysm near the origin has to be diagnosed from subclavian, innominate, and aortic aneurysm, and from other swellings--solid or fluid--met with in the neck. It is often difficult to determine with precision the trunk from which an aneurysm at the root of the neck originates, and not infrequently more than one vessel shares in the dilatation. A careful consideration of the position in which the swelling first appeared, of the direction in which it has progressed, of its pressure effects, and of the condition of the pulses beyond, may help in distinguishing between aortic, innominate, carotid, and subclavian aneurysms. Skiagraphy is also of assistance in recognising the vessel involved.

Tumours of the thyreoid, enlarged lymph glands, and fatty and sarcomatous tumours can usually be distinguished from aneurysm by the history of the swelling and by physical examination. Cystic tumours and abscesses in the neck are sometimes more difficult to differentiate on account of the apparently expansile character of the pulsation transmitted to them. The fact that compression of the vessel does not affect the size and tension of these fluid swellings is useful in distinguishing them from aneurysm.

Treatment. --Digital compression of the vessel against the transverse process of the sixth cervical vertebra--the "carotid tubercle"--has been successfully employed in the treatment of aneurysm near the bifurcation. Proximal ligation in the case of high aneurysms, or distal ligation in those situated at the root of the neck, is more certain. Extirpation of the sac is probably the best method of treatment, especially in those of traumatic origin. These operations are attended with considerable risk of hemiplegia from interference with the blood supply of the brain.

The external carotid and the cervical portion of the internal carotid are seldom the primary seat of aneurysm, although they are liable to be implicated by the upward spread of an aneurysm at the bifurcation of the common trunk. In addition to the ordinary signs of aneurysm, the clinical manifestations are chiefly referable to pressure on the pharynx and larynx, and on the hypoglossal nerve. Aneurysm of the internal carotid is of special importance on account of the way in which it bulges into the pharynx in the region of the tonsil, in some cases closely simulating a tonsillar abscess. Cases are on record in which such an aneurysm has been mistaken for an abscess and incised, with disastrous results.

Aneurysmal varix may occur in the neck as a result of stabs or bullet

wounds. The communication is usually between the common carotid artery and the internal jugular vein. The resulting interference with the cerebral circulation causes headache, giddiness, and other brain symptoms, and a persistent loud murmur is usually a source of annoyance to the patient and may be sufficient indication for operative treatment.

#Intracranial aneurysm# involves the internal carotid and its branches, or the basilar artery, and appears to be more frequently associated with syphilis and with valvular disease of the heart than are external aneurysms. It gives rise to symptoms similar to those of other intracranial tumours, and there is sometimes a loud murmur. It usually proves fatal by rupture, and intracranial haemorrhage. The treatment is to ligate the common carotid or the vertebral artery in the neck, according to the seat of the aneurysm.

#Orbital Aneurysm.#--The term pulsating exophthalmos is employed to embrace a number of pathological conditions, including aneurysm, in which the chief symptoms are pulsation in the orbit and protrusion of the eyeball. There may be, in addition, congestion and oedema of the eyelids, and a distinct thrill and murmur, which can be controlled by compression of the common carotid in the neck. Varying degrees of ocular paralysis and of interference with vision may also be present.

These symptoms are due, in the majority of cases, to an aneurysmal varix of the internal carotid artery and cavernous sinus, which is often traumatic in origin, being produced either by fracture of the base of the skull or by a punctured wound of the orbit. In other cases they are due to aneurysm of the ophthalmic artery, to thrombosis of the cavernous sinus, and, in rare instances, to cirsoid aneurysm.

If compression of the common carotid is found to arrest the pulsation, ligation of this vessel is indicated.

#Subclavian Aneurysm.#--Subclavian aneurysm is usually met with in men who follow occupations involving constant use of the shoulder--for example, dock-porters and coal-heavers. It is more common on the right side.

The aneurysm usually springs from the third part of the artery, and appears as a tense, rounded, pulsatile swelling just above the clavicle and to the outer side of the sterno-mastoid muscle. It occasionally extends towards the thorax, where it may become adherent to the pleura. The radial pulse on the same side is small and delayed. Congestion and oedema of the arm, with pain, numbness, and muscular weakness, may result from pressure on the veins and nerves as they pass under the clavicle; and pressure on the phrenic nerve may induce hiccough. The aneurysm is of slow growth, and occasionally undergoes spontaneous cure.

The conditions most likely to be mistaken for it are a soft, rapidly growing sarcoma, and a normal artery raised on a cervical rib.

On account of the relations of the artery and of its branches, treatment is attended with greater difficulty and danger in subclavian than in almost any other form of external aneurysm. The available operative measures are proximal ligation of the innominate, and distal ligation. In some cases it has been found necessary to combine distal ligation with amputation at the shoulder-joint, to prevent the collateral circulation maintaining the flow through the aneurysm. Matas' operation has been successfully performed by Hogarth Pringle.

#Axillary Aneurysm.#--This is usually met with in the right arm of labouring men and sailors, and not infrequently follows an injury in the region of the shoulder. The vessel may be damaged by the head of a dislocated humerus or in attempts to reduce the dislocation, by the fragments of a fractured bone, or by a stab or cut. Sometimes the vein also is injured and an arterio-venous aneurysm established.

Owing to the laxity of the tissues, it increases rapidly, and it may soon attain a large size, filling up the axilla, and displacing the clavicle upwards. This renders compression of the third part of the

subclavian difficult or impossible. It may extend beneath the clavicle into the neck, or, extending inwards may form adhesions to the chest wall, and, after eroding the ribs, to the pleura.

The usual symptoms of aneurysm are present, and the pressure effects on the veins and nerves are similar to those produced by an aneurysm of the subclavian. Intra-thoracic complications, such as pleurisy or pneumonia, are not infrequent when there are adhesions to the chest wall and pleura. Rupture may take place externally, into the shoulder-joint, or into the pleura.

Extirpation of the sac is the operation of choice, but, if this is impracticable, ligation of the third part of the subclavian may be had recourse to.

#Brachial aneurysm# usually occurs at the bend of the elbow, is of traumatic origin, and is best treated by excision of the sac.

Aneurysmal varix, which was frequently met with in this situation in the days of the barber-surgeons,--usually as a result of the artery having been accidentally wounded while performing venesection of the median basilic vein,--may be treated, according to the amount of discomfort it causes, by a supporting bandage, or by ligation of the artery above and below the point of communication.

Aneurysms of the vessels of the #forearm and hand# call for no special mention; they are almost invariably traumatic, and are treated by excision of the sac.

#Inguinal Aneurysm# (_Aneurysm of the Iliac and Femoral Arteries_).--Aneurysms appearing in the region of Poupart's ligament may have their origin in the external or common iliac arteries or in the upper part of the femoral. On account of the tension of the fascia lata, they tend to spread upwards towards the abdomen, and, to a less extent, downwards into the thigh. Sometimes a constriction occurs across the sac at the level of Poupart's ligament.

The pressure exerted on the nerves and veins of the lower extremity causes pain, congestion, and oedema of the limb. Rupture may take place externally, or into the cellular tissue of the iliac fossa.

These aneurysms have to be diagnosed from pulsating sarcoma growing from the pelvic bones, and from an abscess or a mass of enlarged lymph glands overlying the artery and transmitting its pulsation.

The method of treatment that has met with most success is ligation of the common or external iliac, reached either by reflecting the peritoneum from off the iliac fossa (extra-peritoneal operation), or by going through the peritoneal cavity (trans-peritoneal operation).

#Gluteal Aneurysm.#--An aneurysm in the buttock may arise from the superior or from the inferior gluteal artery, but by the time it forms a salient swelling it is seldom possible to recognise by external examination in which vessel it takes origin. The special symptoms to which it gives rise are pain down the limb from pressure on the sciatic nerve, and interference with the movements at the hip.

Ligation of the hypogastric (internal iliac) by the trans-peritoneal route is the most satisfactory method of treatment. Extirpation of the sac is difficult and dangerous, especially when the aneurysm has spread into the pelvis.

#Femoral Aneurysm.#--Aneurysm of the femoral artery beyond the origin of the profunda branch is usually traumatic in origin, and is more common in Scarpa's triangle than in Hunter's canal. Any of the methods already described is available for their treatment--the choice lying between Matas' operation and ligation of the external iliac.

Aneurysm of the _profunda femoris_ is distinguished from that of the main trunk by the fact that the pulses beyond are, in the former,

unaffected, and by the normal artery being felt pulsating over or alongside the sac.

In aneurysmal varix, a not infrequent result of a bullet wound or a stab, the communication with the vein may involve the main trunk of the femoral artery. Should operative interference become necessary as a result of progressive increase in size of the tumour, or progressive distension of the veins of the limb, an attempt should be made to separate the vessels concerned and to close the opening in each by suture. If this is impracticable, the artery is tied above and below the communication; gangrene of the limb may supervene, and we have observed a case in which the gangrene extended up to the junction of the middle and lower thirds of the thigh, and in which recovery followed upon amputation of the thigh.

#Popliteal Aneurysm.--This is the most common surgical aneurysm, and is not infrequently met with in both limbs. It is generally due to disease of the artery, and repeated slight strains, which are so liable to occur at the knee, play an important part in its formation. In former times it was common in post-boys, from the repeated flexion and extension of the knee in riding.

The aneurysm is usually of the sacculated variety, and may spring from the front or from the back of the vessel. It may exert pressure on the bones and ligaments of the joint, and it has been known to rupture into the articulation. The pain, stiffness, and effusion into the joint which accompany these changes often lead to an erroneous diagnosis of joint disease. The sac may press upon the popliteal artery or vein and their branches, causing congestion and oedema of the leg, and lead to gangrene. Pressure on the tibial and common peroneal nerves gives rise to severe pain, muscular cramp, and weakness of the leg.

The differential diagnosis is to be made from abscess, bursal cyst, enlarged glands, and sarcoma, especially pulsating sarcoma of one of the bones entering into the knee joint.

The choice of operation lies between ligation of the femoral artery in Hunter's canal, and Matas' operation of aneurysmo-arteriorrhaphy. The success which attends the Hunterian operation is evidenced by the fact that Syme performed it thirty-seven times without a single failure. If it fails, the old operation should be considered, but it is a more serious operation, and one which is more liable to be followed by gangrene of the limb. Experience shows that ligation of the vein, or even the removal of a portion of it, is not necessarily followed by gangrene. The risk of gangrene is diminished by a course of digital compression of the femoral artery, before operating on the aneurysm.

Aneurysmal varix is sometimes met with in the region of the popliteal space. It is characterised by the usual symptoms, and is treated by palliative measures, or by ligation of the artery above and below the point of communication.

Aneurysm in the #leg and foot# is rare. It is almost always traumatic, and is treated by excision of the sac.

CHAPTER XV

THE LYMPH VESSELS AND GLANDS

Anatomy and Physiology--INJURIES OF LYMPH VESSELS--Wounds of thoracic duct--DISEASES OF LYMPH VESSELS--Lymphangitis: Varieties--Lymphangiectasis--Filarial disease--Lymphangioma--DISEASES OF LYMPH GLANDS--Lymphadenitis: Septic; Tuberculous; Syphilitic--Lymphadenoma--Leucocythaemia--TUMOURS.

#Surgical Anatomy and Physiology.--Lymph is essentially blood plasma, which has passed through the walls of capillaries. After bathing and nourishing the tissues, it is collected by lymph vessels, which return it to the blood stream by way of the thoracic duct. These lymph vessels take origin in the lymph spaces of the tissues and in the walls of serous cavities, and they usually run alongside blood vessels--perivascular lymph vessels_. They have a structure similar to that of veins, but are more abundantly provided with valves. Along the course of the lymph trunks are the _lymph glands_, which possess a definite capsule and are composed of a reticulated connective tissue, the spaces of which are packed with leucocytes. The glands act as filters, arresting not only inert substances, such as blood pigment circulating in the lymph, but also living elements, such as cancer cells or bacteria. As it passes through a gland the lymph is brought into intimate contact with the leucocytes, and in bacterial infections there is always a struggle between the organisms and the leucocytes, so that the glands may be looked upon as an important line of defence, retarding or preventing the passage of bacteria and their products into the general circulation. The infective agent, moreover, in order to reach the blood stream, must usually overcome the resistance of several glands.

Lymph glands are, for the most part, arranged in groups or chains, such as those in the axilla, neck, and groin. In any given situation they vary in number and size in different individuals, and fresh glands may be formed on comparatively slight stimulus, and disappear when the stimulus is withdrawn. The best-known example of this is the increase in the number of glands in the axilla which takes place during lactation; when this function ceases, many of the glands become involuted and are transformed into fat, and in the event of a subsequent lactation they are again developed. After glands have been removed by operation, new ones may be formed.

The following are the more important groups of glands, and the areas drained by them in the head and neck and in the extremities.

#Head and Neck.--_The anterior auricular (parotid and pre-auricular) glands_ lie beneath the parotid fascia in front of the ear, and some are partly embedded in the substance of the parotid gland; they drain the parts about the temple, cheek, eyelids, and auricle, and are frequently the seat of tuberculous disease. _The occipital gland_, situated over the origin of the trapezius from the superior curved line, drains the top and back of the head; it is rarely infected. _The posterior auricular (mastoid) glands_ lie over the mastoid process, and drain the side of the head and auricle. These three groups pour their lymph into the superficial cervical glands. _The submaxillary_--two to six in number--lie along the lower order of the mandible from the symphysis to the angle, the posterior ones (paramandibular) being closely connected with the submaxillary salivary gland. They receive lymph from the face, lips, floor of the mouth, gums, teeth, anterior part of tongue, and the alae nasi, and from the pre-auricular glands. The lymph passes from them into the deeper cervical glands. They are frequently infected with tubercle, with epithelioma which has spread to them from the mouth, and also with pyogenic organisms. _The submental glands_ lie in or close to the median line between the anterior bellies of the digastric muscles, and receive lymph from the lips. It is rare for them to be the seat of tubercle, but in epithelioma of the lower lip and floor of the mouth they are infected at an early stage of the disease. _The supra-hyoid gland_ lies a little farther back, immediately above the hyoid bone, and receives lymph from the tongue. _The superficial cervical (external jugular) glands_, when present, lie along the external jugular vein, and receives lymph from the occipital and auricular glands and from the auricle. _The sterno-mastoid glands_--glandulae concatenatae--form a chain along the posterior edge of the sterno-mastoid muscle, some of them lying beneath the muscle. They are commonly enlarged in secondary syphilis. _The superior deep cervical (internal jugular) glands_--from six to twenty in number--form a continuous chain along the internal jugular vein, beneath the sterno-mastoid muscle. They drain the various groups of glands which lie nearer the surface, also the interior of the skull, the larynx, trachea,

thyreoid, and lower part of the pharynx, and pour their lymph into the main trunks at the root of the neck. Belonging to this group is one large gland (the tonsillar gland) which lies behind the posterior belly of the digastric, and rests in the angle between the internal jugular and common facial veins. It is commonly enlarged in affections of the tonsil and posterior part of the tongue. In the same group are three or four glands which lie entirely under cover of the upper end of the sterno-mastoid muscle, and surround the accessory nerve before it perforates the muscle. The deep cervical glands are commonly infected by tubercle and also by epithelioma secondary to disease in the tongue or throat. The inferior deep cervical (supra-clavicular) glands lie in the posterior triangle, above the clavicle. They receive lymph from the lowest cervical glands, from the upper part of the chest wall, and from the highest axillary glands. They are frequently infected in cancer of the breast; those on the left side also in cancer of the stomach. The removal of diseased supra-clavicular glands is not to be lightly undertaken, as difficulties are liable to ensue in connection with the thoracic duct, the pleura, or the junction of the subclavian and internal jugular veins. The retro-pharyngeal glands lie on each side of the median line upon the rectus capitis anticus major muscle and in front of the pre-vertebral layer of the cervical fascia. They receive part of the lymph from the posterior wall of the pharynx, the interior of the nose and its accessory cavities, the auditory (Eustachian) tube, and the tympanum. When they are infected with pyogenic organisms or with tubercle bacilli, they may lead to the formation of one form of retro-pharyngeal abscess.

#Upper Extremity.---The epi-trochlear and cubital glands vary in number, that most commonly present lying about an inch and a half above the medial epi-condyle, and other and smaller glands may lie along the medial (internal) bicipital groove or at the bend of the elbow. They drain the ulnar side of the hand and forearm, and pour their lymph into the axillary group. The epi-trochlear gland is sometimes enlarged in syphilis. The axillary glands are arranged in groups: a central group lies embedded in the axillary fascia and fat, and is often related to an opening in it; a posterior or subscapular group lies along the line of the subscapular vessels; anterior or pectoral groups lie behind the pectoralis minor, along the medial side of the axillary vein, and an inter-pectoral group, between the two pectoral muscles. The axillary glands receive lymph from the arm, mamma, and side of the chest, and pass it on into the lowest cervical glands and the main lymph trunk. They are frequently the seat of pyogenic, tuberculous, and cancerous infection, and their complete removal is an essential part of the operation for cancer of the breast.

#Lower Extremity.---The popliteal glands include one superficial gland at the termination of the small saphenous vein, and several deeper ones in relation to the popliteal vessels. They receive lymph from the toes and foot, and transmit it to the inguinal glands. The femoral glands lie vertically along the upper part of the great saphenous vein, and receive lymph from the leg and foot; from them the lymph passes to the deep inguinal and external iliac glands. The femoral glands often participate in pyogenic infections entering through the skin of the toes and sole of the foot. The superficial inguinal glands lie along the inguinal (Poupart's) ligament, and receive lymph from the external genitals, anus, perineum, buttock, and anterior abdominal wall. The lymph passes on to the deep inguinal and external iliac glands. The superficial glands through their relations to the genitals are frequently the subject of venereal infection, and also of epithelioma when this disease affects the genitals or anus; they are rarely the seat of tuberculosis. The deep inguinal glands lie on the medial side of the femoral vein, and sometimes within the femoral canal. They receive lymph from the deep lymphatics of the lower limb, and some of the efferent vessels from the femoral and superficial inguinal glands. The lymph then passes on through the femoral canal to the external iliac glands. The extension of malignant disease, whether cancer or sarcoma, can often be traced along these deeper lymphatics into the pelvis, and as the obstruction to the flow of lymph increases there is a corresponding increase in the swollen dropsical condition of the lower limb on the same side.

The glands of the _thorax_ and _abdomen_ will be considered with the surgery of these regions.

INJURIES OF LYMPH VESSELS

Lymph vessels are divided in all wounds, and the lymph that escapes from them is added to any discharge that may be present. In injuries of larger trunks the lymph may escape in considerable quantity as a colourless, watery fluid--_lymphorrhagia_ ; and the opening through which it escapes is known as a _lymphatic fistula_. This has been observed chiefly after extensive operation for the removal of malignant glands in the groin where there already exists a considerable degree of obstruction to the lymph stream, and in such cases the lymph, including that which has accumulated in the vessels of the limb, may escape in such abundance as to soak through large dressings and delay healing. Ultimately new lymph channels are formed, so that at the end of from four to six weeks the discharge of lymph ceases and the wound heals.

Lymphatic Oedema.--When the lymphatic return from a limb has been seriously interfered with,--as, for example, when the axillary contents has been completely cleared out in operating for cancer of the breast,--a condition of lymphatic oedema may result, the arm becoming swollen, tight, and heavy.

Various degrees of the conditions are met with; in the severe forms, there is pain, as well as incapacity of the limb. As in ordinary oedema, the condition is relieved by elevation of the limb, but not nearly to the same degree; in time the tissues become so hard and tense as scarcely to pit on pressure; this is in part due to the formation of new connective tissue and hypertrophy of the skin; in advanced cases there is a gradual transition into one form of elephantiasis.

Handley has devised a method of treatment--_lymphangioplasty_--the object of which is to drain the lymph by embedding a number of silk threads in the subcutaneous cellular tissue.

#Wounds of the Thoracic Duct.#--The thoracic duct usually opens at the angle formed by the junction of the left internal jugular and subclavian veins, but it may open into either of these vessels by one or by several channels, or the duct may be double throughout its course. There is a smaller duct on the right side--the right lymphatic duct. The duct or ducts may be displaced by a tumour or a mass of enlarged glands, and may be accidentally wounded in dissections at the root of the neck; jets of milky fluid--chyle--may at once escape from it. The jets are rhythmical and coincide with expiration. The injury may, however, not be observed at the time of operation, but later through the dressings being soaked with chyle--_chylorrhoea_. If the wound involves the only existing main duct and all the chyle escapes, the patient suffers from intense thirst, emaciation, and weakness, and may die of inanition; but if, as is usually the case, only one of several collateral channels is implicated, the loss of chyle may be of little moment, as the discharge usually ceases. If the wound heals so that the chyle is prevented from escaping, a fluctuating swelling may form beneath the scar; in course of time it gradually disappears.

An attempt should be made to close the wound in the duct by means of a fine suture; failing this, the duct must be occluded by a ligature as if it were a bleeding artery. The tissues are then stitched over it and the skin wound accurately closed, so as to obtain primary union, firm pressure being applied by dressings and an elastic webbing bandage. Even if the main duct is obliterated, a collateral circulation is usually established. A wound of the right lymphatic duct is of less importance.

Subcutaneous rupture of the thoracic duct may result from a crush of the thorax. The chyle escapes and accumulates in the cellular tissue of the posterior mediastinum, behind the peritoneum, in the pleural cavity (_chylo-thorax_), or in the peritoneal cavity (_chylous ascites_). There are physical signs of fluid in one or other of these situations, but, as

a rule, the nature of the lesion is only recognised when chyle is withdrawn by the exploring needle.

DISEASES OF LYMPH VESSELS

#*Lymphangitis*.--Inflammation of peripheral lymph vessels usually results from some primary source of pyogenic infection in the skin. This may be a wound or a purulent blister, and the streptococcus pyogenes is the organism most frequently present. *Septic lymphangitis* is commonly met with in those who, from the nature of their occupation, handle infective material. A *gonococcal* form has been observed in those suffering from gonorrhoea.

The inflammation affects chiefly the walls of the vessels, and is attended with clotting of the lymph. There is also some degree of inflammation of the surrounding cellular tissue--*peri-lymphangitis*. One or more abscesses may form along the course of the vessels, or a spreading cellulitis may supervene.

The *clinical features* resemble those of other pyogenic infections, and there are wavy red lines running from the source of infection towards the nearest lymph glands. These correspond to the inflamed vessels, and are the seat of burning pain and tenderness. The associated glands are enlarged and painful. In severe cases the symptoms merge into those of septicaemia. When the deep lymph vessels alone are involved, the superficial red lines are absent, but the limb becomes greatly swollen and pits on pressure.

In cases of extensive lymphangitis, especially when there are repeated attacks, the vessels are obliterated by the formation of new connective tissue and a persistent solid oedema results, culminating in one form of elephantiasis.

Treatment.--The primary source of infection is dealt with on the usual lines. If the lymphangitis affects an extremity, Bier's elastic bandage is applied, and if suppuration occurs, the pus is let out through one or more small incisions; in other parts of the body Klapp's suction bells are employed. An autogenous vaccine may be prepared and injected. When the condition has subsided, the limb is massaged and evenly bandaged to promote the disappearance of oedema.

Tuberculous Lymphangitis.--Although lymph vessels play an important role in the spread of tuberculosis, the clinical recognition of the disease in them is exceptional. The infection spreads upwards along the superficial lymphatics, which become nodularly thickened; at one or more points, larger, peri-lymphangitic nodules may form and break down into abscesses and ulcers; the nearest group of glands become infected at an early stage. When the disease is widely distributed throughout the lymphatics of the limb, it becomes swollen and hard--a condition illustrated by lupus elephantiasis.

Syphilitic lymphangitis is observed in cases of primary syphilis, in which the vessels of the dorsum of the penis can be felt as indurated cords.

In addition to acting as channels for the conveyance of bacterial infection, *lymph vessels* frequently convey the cells of malignant tumours, and especially cancer, from the seat of the primary disease to the nearest lymph glands, and they may themselves become the seat of cancerous growth forming nodular cords. The permeation of cancer by way of the lymphatics, described by Sampson Handley, has already been referred to.

#*Lymphangiectasis*# is a dilated or varicose condition of lymph vessels. It is met with as a congenital affection in the tongue and lips, or it may be acquired as the result of any condition which is attended with extensive obliteration or blocking of the main lymph trunks. An interesting type of lymphangiectasis is that which results from the presence of the *filaria Bancrofti* in the vessels, and is observed

chiefly in the groin, spermatic cord, and scrotum of persons who have lived in the tropics.

Filarial disease in the lymphatics of the groin appears as a soft, doughy swelling, varying in size from a walnut to a cocoa-nut; it may partly disappear on pressure and when the patient lies down.

The patient gives a history of feverish attacks of the nature of lymphangitis during which the swelling becomes painful and tender. These attacks may show a remarkable periodicity, and each may be followed by an increase in the size of the swelling, which may extend along the inguinal canal into the abdomen, or down the spermatic cord into the scrotum. On dissection, the swelling is found to be made up of dilated, tortuous, and thickened lymph vessels in which the parent worm is sometimes found, and of greatly enlarged lymph glands which have undergone fibrosis, with giant-cell formation and eosinophile aggregations. The fluid in the dilated vessels is either clear or turbid, in the latter case resembling chyle. The affection is frequently bilateral, and may be associated with lymph scrotum, with elephantiasis, and with chyluria.

The diagnosis is to be made from such other swellings in the groin as hernia, lipoma, or cystic pouching of the great saphenous vein. It is confirmed by finding the recently dead or dying worms in the inflamed lymph glands.

Treatment.--When the disease is limited to the groin or scrotum, excision may bring about a permanent cure, but it may result in the formation of lymphatic sinuses and only afford temporary relief.

#Lymphangioma.--A lymphangioma is a swelling composed of a series of cavities and channels filled with lymph and freely communicating with one another. The cavities result either from the new formation of lymph spaces or vessels, or from the dilatation of those which already exist; their walls are composed of fibro-areolar tissue lined by endothelium and strengthened by non-striped muscle. They are rarely provided with a definite capsule, and frequently send prolongations of their substance between and into muscles and other structures in their vicinity. They are of congenital origin and usually make their appearance at or shortly after birth. When the tumour is made up of a meshwork of caverns and channels, it is called a cavernous lymphangioma; when it is composed of one or more cysts, it is called a cystic lymphangioma. It is probable that the cysts are derived from the caverns by breaking down and absorption of the intervening septa, as transition forms between the cavernous and cystic varieties are sometimes met with.

The cavernous lymphangioma appears as an ill-defined, soft swelling, presenting many of the characters of a subcutaneous haemangioma, but it is not capable of being emptied by pressure, it does not become tense when the blood pressure is raised, as in crying, and if the tumour is punctured, it yields lymph instead of blood. It also resembles a lipoma, especially the congenital variety which grows from the periosteum, and the differential diagnosis between these is rarely completed until the swelling is punctured or explored by operation. If treatment is called for, it is carried out on the same lines as for haemangioma, by means of electrolysis, igni-puncture, or excision. Complete excision is rarely possible because of the want of definition and encapsulation, but it is not necessary for cure, as the parts that remain undergo cicatrisation.

[Illustration: FIG. 76.--Congenital Cystic Tumour or Hygroma of Axilla.

(From a photograph lent by Dr. Lediard.)]

The cystic lymphangioma, lymphatic cyst, or congenital cystic hygroma is most often met with in the neck--hydrocele of the neck; it is situated beneath the deep fascia, and projects either in front of or behind the sterno-mastoid muscle. It may attain a large size, the overlying skin and cyst wall may be so thin as to be translucent, and it has been known to cause serious impairment of respiration through pressing on the trachea. In the axilla also the cystic tumour may attain

a considerable size (Fig. 76); less frequent situations are the groin, and the floor of the mouth, where it constitutes one form of ranula.

The nature of these swellings is to be recognised by their situation, by their having existed from infancy, and, if necessary, by drawing off some of the contents of the cyst through a fine needle. They are usually remarkably indolent, persisting often for a long term of years without change, and, like the haemangioma, they sometimes undergo spontaneous cicatrisation and cure. Sometimes the cystic tumour becomes infected and forms an abscess--another, although less desirable, method of cure. Those situated in the neck are most liable to suppurate, probably because of pyogenic organisms being brought to them by the lymphatics taking origin in the scalp, ear, or throat.

If operative interference is called for, the cysts may be tapped and injected with iodine, or excised; the operation for removal may entail a considerable dissection amongst the deeper structures at the root of the neck, and should not be lightly undertaken; parts left behind may be induced to cicatrise by inserting a tube of radium and leaving it for a few days.

Lymphangiomas are met with in the abdomen in the form of omental cysts.

DISEASES OF LYMPH GLANDS

#Lymphadenitis.#--Inflammation of lymph glands results from the advent of an irritant, usually bacterial or toxic, brought to the glands by the afferent lymph vessels. These vessels may share in the inflammation and be the seat of lymphangitis, or they may show no evidence of the passage of the noxa. It is exceptional for the irritant to reach the gland through the blood-stream.

A strain or other form of trauma is sometimes blamed for the onset of lymphadenitis, especially in the glands of the groin (bubo), but it is usually possible to discover some source of pyogenic infection which is responsible for the mischief, or to obtain a history of some antecedent infection such as gonorrhoea. It is possible for gonococci to lie latent in the inguinal glands for long periods, and only give rise to lymphadenitis if the glands be subsequently subjected to injury. The glands most frequently affected are those in the neck, axilla, and groin.

The characters of the lymphadenitis vary with the nature of the irritant. Sometimes it is mild and evanescent, as in the glandular enlargement in the neck which attends tonsillitis and other forms of sore throat. Sometimes it is more persistent, as in the enlargement that is associated with adenoids, hypertrophied tonsils, carious teeth, eczema of the scalp, and otorrhoea; and it is possible that this indolent enlargement predisposes to tuberculous infection. A similar enlargement is met with in the axilla in cases of chronic interstitial mastitis, and in the groin as a result of chronic irritation about the external genitals, such as balanitis.

Sometimes the lymphadenitis is of an acute character, and the tendency is towards the formation of an abscess. This is illustrated in the axillary glands as a result of infected wounds of the fingers; in the femoral glands in infected wounds or purulent blisters on the foot; in the inguinal glands in gonorrhoea and soft sore; and in the cervical glands in the severer forms of sore throat associated with diphtheria and scarlet fever. The most acute suppurations result from infection with streptococci.

Superficial glands, when inflamed and suppurating, become enlarged, tender, fixed, and matted to one another. In the glands of the groin the suppurative process is often remarkably sluggish; purulent foci form in the interior of individual glands, and some time may elapse before the pus erupts through their respective capsules. In the deeply placed cervical glands, especially in cases of streptococcal throat infections,

the suppuration rapidly involves the surrounding cellular tissue, and the clinical features are those of an acute cellulitis and deeply seated abscess. When this is incised the necrosed glands may be found lying in the pus, and on bacteriological examination are found to be swarming with streptococci. In suppuration of the axillary glands the abscess may be quite superficial, or it may be deeply placed beneath the strong fascia and pectoral muscles, according to the group of glands involved.

The diagnosis of septic lymphadenitis is usually easy. The indolent enlargements are not always to be distinguished, however, from commencing tuberculous disease, except by the use of the tuberculin test, and by the fact that they usually disappear on removing the peripheral source of irritation.

Treatment.--The first indication is to discover and deal with the source of infection, and in the indolent forms of lymphadenitis this will usually be followed by recovery. In the acute forms following on pyogenic infection, the best results are obtained from the hyperaemic treatment carried out by means of suction bells. If suppuration is not thereby prevented, or if it has already taken place, each separate collection of pus is punctured with a narrow-bladed knife and the use of the suction bell is persevered with. If there is a large periglandular abscess, as is often the case, in the neck and axilla, the opening may require to be made by Hilton's method, and it may be necessary to insert a drainage-tube.

[Illustration: FIG. 77.--Tuberculous Cervical Gland with abscess formation in subcutaneous cellular tissue, in a boy aet. 10.]

#Tuberculous Disease of Glands.#--This is a disease of great frequency and importance. The tubercle bacilli usually gain access to the gland through the afferent lymph vessels, which convey them from some lesion of the surface within the area drained by them. Tuberculous infection may supervene in glands that are already enlarged as a result of chronic septic irritation. While any of the glands in the body may be affected, the disease is most often met with in the cervical groups which derive their lymph from the mouth, nose, throat, and ear.

The appearance of the glands on section varies with the stage of the disease. In the early stages the gland is enlarged, it may be to many times its natural size, is normal in appearance and consistence, and as there is no peri-adenitis it is easily shelled out from its surroundings. On microscopical examination, however, there is evidence of infection in the shape of bacilli and of characteristic giant and epithelioid cells. At a later stage, the gland tissue is studded with minute yellow foci which tend to enlarge and in time to become confluent, so that the whole gland is ultimately converted into a caseous mass. This caseous material is surrounded by the thickened capsule which, as a result of peri-adenitis, tends to become adherent to and fused with surrounding structures, and particularly with layers of fascia and with the walls of veins. The caseated tissue often remains unchanged for long periods; it may become calcified, but more frequently it breaks down and liquefies.

#Tuberculous disease in the cervical glands# is a common accompaniment or sequel of adenoids, enlarged tonsils, carious teeth, pharyngitis, middle-ear disease, and conjunctivitis. These lesions afford the bacilli a chance of entry into the lymph vessels, in which they are carried to the glands, where they give rise to disease.

The enlargement may affect only one gland, usually below the angle of the mandible, and remain confined to it, the gland reaching the size of a hazel-nut, and being ovoid, firm, and painless. More commonly the disease affects several glands, on one or on both sides of the neck. When the disease commences in the pre-auricular or submaxillary glands, it tends to spread to those along the carotid sheath: when the posterior auricular and occipital glands are first involved, the spread is to those along the posterior border of the sterno-mastoid. In many cases all the chains in front of, beneath, and behind this muscle are involved, the enlarged glands extending from the mastoid to the

clavicle. They are at first discrete and movable, and may even vary in size from time to time; but with the addition of peri-adenitis they become fixed and matted together, forming lobulated or nodular masses (Fig. 78). They become adherent not only to one another, but also to the structures in their vicinity,--and notably to the internal jugular vein,--a point of importance in regard to their removal by operation.

At any stage the disease may be arrested and the glands remain for long periods without further change. It is possible that the tuberculous tissue may undergo cicatrisation. More commonly suppuration ensues, and a cold abscess forms, but if there is a mixed infection, the pyogenic factor being usually derived from the throat, it may take on active features.

[Illustration: FIG. 78.--Mass of Tuberculous Glands removed from Axilla (cf. Fig. 79).]

The transition from the solid to the liquefied stage is attended with pain and tenderness in the gland, which at the same time becomes fixed and globular, and finally fluctuation can be elicited.

If left to itself, the softened tubercle erupts through the capsule of the gland and infects the cellular tissue. The cervical fascia is perforated and a cold abscess, often much larger than the gland from which it took origin, forms between the fascia and the overlying skin. The further stages--reddening, undermining of skin and external rupture, with the formation of ulcers and sinuses--have been described with tuberculous abscess. The ulcers and sinuses persist indefinitely, or they heal and then break out again; sometimes the skin becomes infected, and a condition like lupus spreads over a considerable area. Spontaneous healing finally takes place after the caseous tubercle has been extruded; the resulting scars are extremely unsightly, being puckered or bridled, or hypertrophied like keloid.

While the disease is most common in childhood and youth, it may be met with even in advanced life; and although often associated with impaired health and unhealthy surroundings, it may affect those who are apparently robust and are in affluent circumstances.

Diagnosis.--The chief importance lies in differentiating tuberculous disease from lympho-sarcoma and from lymphadenoma, and this is usually possible from the history and from the nature of the enlargement. Signs of liquefaction and suppuration support the diagnosis of tubercle. If any doubt remains, one of the glands should be removed and submitted to microscopical examination. Other forms of sarcoma, and the enlargement of an accessory thyreoid, are less likely to be confused with tuberculous glands. Calcified tuberculous glands give definite shadows with the X-rays.

Enlargement of the cervical glands from secondary cancer may simulate tuberculosis, but is differentiated by its association with cancer in the mouth or throat, and by the characteristic, stone-like induration of epithelioma.

The cold abscess which results from tuberculous glands is to be distinguished from that due to disease in the cervical spine, retro-pharyngeal abscess, as well as from congenital and other cystic swellings in the neck.

Prognosis.--Next to lupus, glandular disease is of all tuberculous lesions the least dangerous to life; but while it is the rule to recover from tuberculous disease of glands with or without an operation, it is unfortunately quite common for such persons to become the subjects of tuberculosis in other parts of the body at any subsequent period of life.

Treatment.--There is considerable difference of opinion regarding the treatment of glandular tuberculosis. Some authorities, impressed with the undoubted possibility of natural cure, are satisfied with promoting this by measures directed towards improving the general health, by the

prolonged administration of tuberculin, and by repeated exposures to the X-rays and to sunlight. Others again, influenced by the risk of extension of the disease and by the destruction of tissue and disfigurement caused by breaking down of the tuberculous tissue and mixed infection, advocate the removal of the glands by operation.

The conditions vary widely in different cases, and the treatment should be adapted to the individual requirements. If the disease remains confined to the glands originally infected and there are no signs of breaking down, "expectant measures" may be persevered with.

[Illustration: FIG. 79.--Tuberculous Axillary Glands (cf. Fig. 78).]

If, on the other hand, the disease exhibits aggressive tendencies, the question of operation should be considered. The undesirable results of the breaking down and liquefaction of the diseased gland may be avoided by the timely withdrawal of the fluid contents through a hollow needle.

The excision of tuberculous glands is often a difficult operation, because of the number and deep situation of the glands to be removed, and of the adhesions to surrounding structures. The skin incision must be sufficiently extensive to give access to the whole of the affected area, and to avoid disfigurement should, whenever possible, be made in the line of the natural creases of the skin. In exposing the glands the common facial and other venous trunks may require to be clamped and tied. Care must be taken not to injure the important nerves, particularly the accessory, the vagus, and the phrenic. The inframaxillary branches of the facial, the hypoglossal and its descending branches, and the motor branches of the deep cervical plexus, are also liable to be injured. The dissection is rendered easier and is attended with less risk of injury to the nerves, if the patient is placed in the sitting posture so as to empty the veins, and, instead of a knife, the conical scissors of Mayo are employed. When the glands are extensively affected on both sides of the neck, it is advisable to allow an interval to elapse rather than to operate on both sides at one sitting. (Op. Surg._, p. 189.)

If the tonsils are enlarged they should not be removed at the same time, as, by so doing, there is a risk of pyogenic infection from the throat being carried to the wound in the neck, but they should be removed, after an interval, to prevent relapse of disease in the glands.

When the skin is broken and caseous tuberculous tissue is exposed, healing is promoted by cutting away diseased skin, removing the granulation tissue with the spoon, scraping sinuses, and packing the cavity with iodoform worsted and treating it by the open method and secondary suture if necessary. Exposure to the sunshine on the seashore and to the X-rays is often beneficial in these cases.

#Tuberculous disease in the axillary glands# may be a result of extension from those in the neck, from the mamma, ribs, or sternum, or more rarely from the upper extremity. We have seen it from an infected wound of a finger. In some cases no source of infection is discoverable. The individual glands attain a considerable size, and they fuse together to form a large tumour which fills up the axillary space. The disease progresses more rapidly than it does in the cervical glands, and almost always goes on to suppuration with the formation of sinuses. Conservative measures need not be considered, as the only satisfactory treatment is excision, and that without delay.

#Tuberculous disease in the glands of the groin# is comparatively rare. We have chiefly observed it in the femoral glands as a result of inoculation tubercle on the toes or sole of the foot. The affected glands nearly always break down and suppurate, and after destroying the overlying skin give rise to fungating ulcers. The treatment consists in excising the glands and the affected skin. The dissection may be attended with troublesome haemorrhage from the numerous veins that converge towards the femoral trunk.

Tuberculous disease in the mesenteric and bronchial glands is

described with the surgery of regions.

#Syphilitic Disease of Glands.---Enlargement of lymph glands is a prominent feature of acquired syphilis, especially in the form of the indolent or bullet-bubo which accompanies the primary lesion, and the general enlargement of glands that occurs in secondary syphilis. Gummatous disease in glands is extremely rare; the affected gland rapidly enlarges to the size of a walnut, and may then persist for a long period without further change; if it breaks down, the overlying skin is destroyed and the caseated tissue of the gumma exposed.

#Lymphadenoma.---Hodgkin's Disease (Pseudo-leukaemia of German authors).---This is a rare disease, the origin of which is as yet unknown, but analogy would suggest that it is due to infection with a slowly growing micro-organism. It is chiefly met with in young subjects, and is characterised by a painless enlargement of a particular group of glands, most commonly those in the cervical region (Fig. 80).

[Illustration: FIG. 80---Chronic Hodgkin's Disease in a boy aet. 11.]

The glands are usually larger than in tuberculosis, and they remain longer discrete and movable; they are firm in consistence, and on section present a granular appearance due to overgrowth of the connective-tissue framework. In time the glandular masses may form enormous projecting tumours, the swelling being added to by lymphatic oedema of the overlying cellular tissue and skin.

The enlargement spreads along the chain of glands to those above the clavicle, to those in the axilla, and to those of the opposite side (Fig. 81). Later, the glands in the groin become enlarged, and it is probable that the infection has spread from the neck along the mediastinal, bronchial, retro-peritoneal, and mesenteric glands, and has branched off to the iliac and inguinal groups.

Two clinical types are recognised, one in which the disease progresses slowly and remains confined to the cervical glands for two or more years; the other, in which the disease is more rapidly disseminated and causes death in from twelve to eighteen months.

[Illustration: FIG. 81---Lymphadenoma (Hodgkin's Disease) affecting left side of neck and left axilla, in a woman aet. 44. Three years' duration.]

In the acute form, the health suffers, there is fever, and the glands may vary in size with variations in the temperature; the blood presents the characters met with in secondary anaemia. The spleen, liver, testes, and mammae may be enlarged; the glandular swellings press on important structures, such as the trachea, oesophagus, or great veins, and symptoms referable to such pressure manifest themselves.

Diagnosis.---Considerable difficulty attends the diagnosis of lymphadenoma at an early stage. The negative results of tuberculin tests may assist in the differentiation from tuberculous disease, but the more certain means of excising one of the suspected glands and submitting it to microscopical examination should be had recourse to. The sections show proliferation of endothelial cells, the formation of numerous giant cells quite unlike those of tuberculosis and a progressive fibrosis. Lympho-sarcoma can usually be differentiated by the rapid assumption of the local features of malignant disease, and in a gland removed for examination, a predominance of small round cells with scanty protoplasm. The enlargement associated with leucocythaemia is differentiated by the characteristic changes in the blood.

Treatment.---In the acute form of lymphadenoma, treatment is of little avail. Arsenic may be given in full doses either by the mouth or by subcutaneous injection; the intravenous administration of neo-salvarsan may be tried. Exposure to the X-rays and to radium has been more successful than any other form of treatment. Excision of glands, although sometimes beneficial, seldom arrests the progress of the disease. The ease and rapidity with which large masses of glands may be shelled out is in remarkable contrast to what is observed in tuberculous

disease. Surgical interference may give relief when important structures are being pressed upon--tracheotomy, for example, may be required where life is threatened by asphyxia.

#Leucocythaemia.#--This is a disease of the blood and of the blood-forming organs, in which there is a great increase in the number, and an alteration of the character, of the leucocytes present in the blood. It may simulate lymphadenoma, because, in certain forms of the disease, the lymph glands, especially those in the neck, axilla, and groin, are greatly enlarged.

TUMOURS OF LYMPH GLANDS

#Primary Tumours.#--Lympho-sarcoma, which may be regarded as a sarcoma starting in a lymph gland, appears in the neck, axilla, or groin as a rapidly growing tumour consisting of one enlarged gland with numerous satellites. As the tumour increases in size, the sarcomatous tissue erupts through the capsule of the gland, and infiltrates the surrounding tissues, whereby it becomes fixed to these and to the skin.

[Illustration: FIG. 82.--Lympho-Sarcoma removed from Groin. It will be observed that there is one large central parent tumour surrounded by satellites.]

The prognosis is grave in the extreme, and the only hope is in early excision, followed by the use of radium and X-rays. We have observed a case of lympho-sarcoma above the clavicle, in which excision of all that was removable, followed by the insertion of a tube of radium for ten days, was followed by a disappearance of the disease over a period which extended to nearly five years, when death resulted from a tumour in the mediastinum. In a second case in which the growth was in the groin, the patient, a young man, remained well for over two years and was then lost sight of.

#Secondary Tumours.#--Next to tuberculosis, secondary cancer is the most common disease of lymph glands. In the neck it is met with in association with epithelioma of the lip, tongue, or fauces. The glands form tumours of variable size, and are often larger than the primary growth, the characters of which they reproduce. The glands are at first movable, but soon become fixed both to each other and to their surroundings; when fixed to the mandible they form a swelling of bone-like hardness; in time they soften, liquefy, and burst through the skin, forming foul, fungating ulcers. A similar condition is met with in the groin from epithelioma of the penis, scrotum, or vulva. In cancer of the breast, the infection of the axillary glands is an important complication.

In pigmented or melanotic cancers of the skin, the glands are early infected and increase rapidly, so that, when the primary growth is still of small size--as, for example, on the sole of the foot--the femoral glands may already constitute large pigmented tumours.

[Illustration: FIG. 83.--Cancerous Glands in Neck secondary to Epithelioma of Lip.

(Mr. G. L. Chiene's case.)]

The implication of the glands in other forms of cancer will be considered with regional surgery.

Secondary sarcoma is seldom met with in the lymph glands except when the primary growth is a lympho-sarcoma and is situated in the tonsil, thyroid, or testicle.

THE NERVES

Anatomy--INJURIES OF NERVES: Changes in nerves after division; Repair and its modifications; Clinical features; _Primary and secondary suture--SUBCUTANEOUS INJURIES OF NERVES--DISEASES: _Neuritis_; _Tumours--Surgery of the individual nerves: _Brachial neuralgia_; _Sciatica_; _Trigeminal neuralgia_.

#Anatomy.#--A nerve-trunk is made up of a variable number of bundles of nerve fibres surrounded and supported by a framework of connective tissue. The nerve fibres are chiefly of the medullated type, and they run without interruption from a nerve cell or neuron in the brain or spinal medulla to their peripheral terminations in muscle, skin, and secretory glands.

Each nerve fibre consists of a number of nerve fibrils collected into a central bundle--the axis cylinder--which is surrounded by an envelope, the neurolemma or sheath of Schwann. Between the neurolemma and the axis cylinder is the medullated sheath, composed of a fatty substance known as myelin. This medullated sheath is interrupted at the nodes of Ranvier, and in each internode is a nucleus lying between the myelin and the neurolemma. The axis cylinder is the essential conducting structure of the nerve, while the neurolemma and the myelin act as insulating agents. The axis cylinder depends for its nutrition on the central neuron with which it is connected, and from which it originally developed, and it degenerates if it is separated from its neuron.

The connective-tissue framework of a nerve-trunk consists of the perineurium, or general sheath, which surrounds all the bundles; the epineurium, surrounding individual groups of bundles; and the endoneurium, a delicate connective tissue separating the individual nerve fibres. The blood vessels and lymphatics run in these connective-tissue sheaths.

According to Head and his co-workers, Sherren and Rivers, the afferent fibres in the peripheral nerves can be divided into three systems:--

1. Those which subserve deep sensibility and conduct the impulses produced by pressure as well as those which enable the patient to recognise the position of a joint on passive movement (joint-sensation), and the kinaesthetic sense, which recognises that active contraction of the muscle is taking place (active muscle-sensation). The fibres of this system run with the motor nerves, and pass to muscles, tendons, and joints. Even division of both the ulnar and the median nerves above the wrist produces little loss of deep sensibility, unless the tendons are also cut through. The failure to recognise this form of sensibility has been largely responsible for the conflicting statements as to the sensory phenomena following operations for the repair of divided nerves.

2. Those which subserve protopathic sensibility--that is, are capable of responding to painful cutaneous stimuli and to the extremes of heat and cold. These also endow the hairs with sensibility to pain. They are the first to regenerate after division.

3. Those which subserve epicritic sensibility, the most highly specialised, capable of appreciating light touch, e.g. with a wisp of cotton wool, as a well-localised sensation, and the finer grades of temperature, called cool and warm (72°-104° F.), and of discriminating as separate the points of a pair of compasses 2 cms. apart. These are the last to regenerate.

A nerve also exerts a trophic influence on the tissues in which it is distributed.

The researches of Stoffel on the minute anatomy of the larger nerves, and the disposition in them of the bundles of nerve fibres supplying different groups of muscles, have opened up what promises to be a fruitful field of clinical investigation and therapeutics. He has shown

that in the larger nerve-trunks the nerve bundles for special groups of muscles are not, as was formerly supposed, arranged irregularly and fortuitously, but that on the contrary the nerve fibres to a particular group of muscles have a typical and practically constant position within the nerve.

In the large nerve-trunks of the limbs he has worked out the exact position of the bundles for the various groups of muscles, so that in a cross section of a particular nerve the component bundles can be labelled as confidently and accurately as can be the cortical areas in the brain. In the living subject, by using a fine needle-like electrode and a very weak galvanic current, he has been able to differentiate the nerve bundles for the various groups of muscles. In several cases of spastic paralysis he succeeded in picking out in the nerve-trunk of the affected limb the nerve bundles supplying the spastic muscles, and, by resecting portions of them, in relieving the spasm. In a case of spastic contracture of the pronator muscles of the forearm, for example, an incision is made along the line of the median nerve above the bend of the elbow. At the lateral side of the median nerve, where it lies in contact with the biceps muscle, is situated a well-defined and easily isolated bundle of fibres which supplies the pronator teres, the flexor carpi radialis, and the palmaris longus muscles. On incising the sheath of the nerve this bundle can be readily dissected up and its identity confirmed by stimulating it with a very weak galvanic current. An inch or more of the bundle is then resected.

INJURIES OF NERVES

Nerves are liable to be cut or torn across, bruised, compressed, stretched, or torn away from their connections with the spinal medulla.

#Complete Division of a Mixed Nerve.--Complete division is a common result of accidental wounds, especially above the wrist, where the ulnar, median, and radial nerves are frequently cut across, and in gun-shot injuries.

Changes in Structure and Function.--The mere interruption of the continuity of a nerve results in degeneration of its fibres, the myelin being broken up into droplets and absorbed, while the axis cylinders swell up, disintegrate, and finally disappear. Both the conducting and the insulating elements are thus lost. The degeneration in the central end of the divided nerve is usually limited to the immediate proximity of the lesion, and does not even involve all the nerve fibres. In the distal end, it extends throughout the entire peripheral distribution of the nerve, and appears to be due to the cutting off of the fibres from their trophic nerve cells in the spinal medulla. Immediate suturing of the ends does not affect the degeneration of the distal segment. The peripheral end undergoes complete degeneration in from six weeks to two months.

The physiological effects of complete division are that the muscles supplied by the nerve are immediately paralysed, the area to which it furnishes the sole cutaneous supply becomes insensitive, and the other structures, including tendons, bones, and joints, lose sensation, and begin to atrophy from loss of the trophic influence.

#Nerves divided in Amputation.--In the case of nerves divided in an amputation, there is an active, although necessarily abortive, attempt at regeneration, which results in the formation of bulbous swellings at the cut ends of the nerves. When there has been suppuration, and especially if the nerves have been cut so as to be exposed in the wound, these bulbous swellings may attain an abnormal size, and are then known as "amputation" or "stump neuromas" (Fig. 84).

When the nerves in a stump have not been cut sufficiently short, they may become involved in the cicatrix, and it may be necessary, on account of pain, to free them from their adhesions, and to resect enough of the terminal portions to prevent them again becoming adherent. When this is difficult, a portion may be resected from each of the nerve-trunks at a

higher level; and if this fails to give relief, a fresh amputation may be performed. When there is agonising pain dependent upon an ascending neuritis, it may be necessary to resect the corresponding posterior nerve roots within the vertebral canal.

[Illustration: FIG. 84---Stump Neuromas of Sciatic Nerve, excised forty years after the original amputation by Mr. A. G. Miller.]

#Other Injuries of Nerves.--_Contusion_ of a nerve-trunk is attended with extravasation of blood into the connective-tissue sheaths, and is followed by degeneration of the contused nerve fibres. Function is usually restored, the conducting paths being re-established by the formation of new nerve fibres.

When a nerve is _torn across_ or badly _crushed_--as, for example, by a fractured bone--the changes are similar to those in a divided nerve, and the ultimate result depends on the amount of separation between the ends and the possibility of the young axis cylinders bridging the gap.

Involvement of Nerves in Scar Tissue.--Pressure or traction may be exerted upon a nerve by contracting scar tissue, or a process of neuritis or perineuritis may be induced.

When terminal filaments are involved in a scar, it is best to dissect out the scar, and along with it the ends of the nerves pressed upon. When a nerve-trunk, such as the sciatic, is involved in cicatricial tissue, the nerve must be exposed and freed from its surroundings (_neurolysis_), and then stretched so as to tear any adhesions that may be present above or below the part exposed. It may be advisable to displace the liberated nerve from its original position so as to minimise the risk of its incorporation in the scar of the original wound or in that resulting from the operation--for example, the radial nerve may be buried in the substance of the triceps, or it may be surrounded by a segment of vein or portion of fat-bearing fascia.

Injuries of nerves resulting from #gun-shot wounds# include: (1) those in which the nerve is directly damaged by the bullet, and (2) those in which the nerve-trunk is involved secondarily either by scar tissue in its vicinity or by callus following fracture of an adjacent bone. The primary injuries include contusion, partial or complete division, and perforation of the nerve-trunk. One of the most constant symptoms is the early occurrence of severe neuralgic pain, and this is usually associated with marked hyperesthesia.

#Regeneration.--_Process of Repair when the Ends are in Contact._--If the wound is aseptic_, and the ends of the divided nerve are sutured or remain in contact, they become united, and the conducting paths are re-established by a regeneration of nerve fibres. There is a difference of opinion as to the method of regeneration. The Wallerian doctrine is that the axis cylinders in the central end grow downwards, and enter the nerve sheaths of the distal portion, and continue growing until they reach the peripheral terminations in muscle and skin, and in course of time acquire a myelin sheath; the cells of the neurolemma multiply and form long chains in both ends of the nerve, and are believed to provide for the nourishment and support of the actively lengthening axis cylinders. Another view is that the formation of new axis cylinders is not confined to the central end, but that it goes on also in the peripheral segment, in which, however, the new axis cylinders do not attain maturity until continuity with the central end has been re-established.

If the wound becomes infected_ and suppuration occurs, the young nerve fibres are destroyed and efficient regeneration is prevented; the formation of scar tissue also may constitute a permanent obstacle to new nerve fibres bridging the gap.

When the ends are not in contact, reunion of the divided nerve fibres does not take place whether the wound is infected or not. At the proximal end there forms a bulbous swelling, which becomes adherent to the scar tissue. It consists of branching axis cylinders running in all

directions, these having failed to reach the distal end because of the extent of the gap. The peripheral end is completely degenerated, and is represented by a fibrous cord, the cut end of which is often slightly swollen or bulbous, and is also incorporated with the scar tissue of the wound.

#Clinical Features.--The symptoms resulting from division and non-union of a nerve-trunk necessarily vary with the functions of the affected nerve. The following description refers to a mixed sensori-motor trunk, such as the median or radial (musculo-spiral) nerve.

Sensory Phenomena.--Superficial touch is tested by means of a wisp of cotton wool stroked gently across the skin; the capacity of discriminating two points as separate, by a pair of blunt-pointed compasses; the sensation of pressure, by means of a pencil or other blunt object; of pain, by pricking or scratching with a needle; and of sensibility to heat and cold, by test-tubes containing water at different temperatures. While these tests are being carried out, the patient's eyes are screened off.

After division of a nerve containing sensory fibres, there is an area of absolute cutaneous insensibility to touch (anaesthesia), to pain (analgesia), and to all degrees of temperature--_loss of protopathic sensibility_, surrounded by an area in which there is loss of sensation to light touch, inability to recognise minor differences of temperature (72 o-104 o F.), and to appreciate as separate impressions the contact of the two points of a compass--_loss of epicritic sensibility_ (Head and Sherren) (Figs. 91, 92).

Motor Phenomena.--There is immediate and complete loss of voluntary power in the muscles supplied by the divided nerve. The muscles rapidly waste, and within from three to five days, they cease to react to the faradic current. When tested with the galvanic current, it is found that a stronger current must be used to call forth contraction than in a healthy muscle, and the contraction appears first at the closing of the circuit when the anode is used as the testing electrode. The loss of excitability to the interrupted current, and the specific alteration in the type of contraction with the constant current, is known as the _reaction of degeneration_. After a few weeks all electric excitability is lost. The paralysed muscles undergo fatty degeneration, which attains its maximum three or four months after the division of the nerve. Further changes may take place, and result in the transformation of the muscle into fibrous tissue, which by undergoing shortening may cause deformity known as paralytic contracture.

Vaso-motor Phenomena.--In the majority of cases there is an initial rise in the temperature of the part (2 o to 3 o F.), with redness and increased vascularity. This is followed by a fall in the local temperature, which may amount to 8 o or 10 o F., the parts becoming pale and cold. Sometimes the hyperaemia resulting from vaso-motor paralysis is more persistent, and is associated with swelling of the parts from oedema--the so-called angio-neurotic oedema. The vascularity varies with external influences, and in cold weather the parts present a bluish appearance.

Trophic Phenomena.--Owing to the disappearance of the subcutaneous fat, the skin is smooth and thin, and may be abnormally dry. The hair is harsh, dry, and easily shed. The nails become brittle and furrowed, or thick and curved, and the ends of the fingers become club-shaped. Skin eruptions, especially in the form of blisters, occur, or there may be actual ulcers of the skin, especially in winter. In aggravated cases the tips of the fingers disappear from progressive ulceration, and in the sole of the foot a perforating ulcer may develop. Arthropathies are occasionally met with, the joints becoming the seat of a painless effusion or hydrops, which is followed by fibrous thickening of the capsular and other ligaments, and terminates in stiffness and fibrous ankylosis. In this way the fingers are seriously crippled and deformed.

#Treatment of Divided Nerves.--The treatment consists in approximating the divided ends of the nerve and placing them under the most favourable

conditions for repair, and this should be done at the earliest possible opportunity. (_Op. Surg._, pp. 45, 46.)

#Primary Suture.--The reunion of a recently divided nerve is spoken of as primary suture, and for its success asepsis is essential. As the suturing of the ends of the nerve is extremely painful, an anaesthetic is required.

When the wound is healed and while waiting for the restoration of function, measures are employed to maintain the nutrition of the damaged nerve and of the parts supplied by it. The limb is exercised, massaged, and doused, and protected from cold and other injurious influences. The nutrition of the paralysed muscles is further improved by electricity. The galvanic current is employed, using at first a mild current of not more than 5 milliamperes for about ten minutes, the current being made to flow downwards in the course of the nerve, with the positive electrode applied to the spine, and the negative over the affected nerve near its termination. It is an advantage to have a metronome in the circuit whereby the current is opened and closed automatically at intervals, so as to cause contraction of the muscles.

The results of primary suture, when it has been performed under favourable conditions, are usually satisfactory. In a series of cases investigated by Head and Sherren, the period between the operation and the first return of sensation averaged 65 days. According to Purves Stewart protopathic sensation commences to appear in about six weeks and is completely restored in six months; electric sensation and motor power reappear together in about six months, and restoration is complete in a year. When sensation returns, the area of insensibility to pain steadily diminishes and disappears; sensibility to extremes of temperature appears soon after; and last of all, after a considerable interval, there is simultaneous return of appreciation of light touch, moderate degrees of temperature, and the points of a compass.

A clinical means of estimating how regeneration in a divided nerve is progressing has been described by Tinel. He found that a tingling sensation, similar to that experienced in the foot, when it is recovering from the "sleeping" condition induced by prolonged pressure on the sciatic nerve from sitting on a hard bench, can be elicited on percussing over _growing_ axis cylinders. Tapping over the proximal end of a _newly divided nerve_, _e.g._ the common peroneal behind the head of the fibula, produces no tingling, but when in about three weeks axis cylinders begin to grow in the proximal end-bulb, local tingling is induced by tapping there. The downward growth of the axis cylinders can be traced by tapping over the distal segment of the nerve, the tingling sensation being elicited as far down as the young axis cylinders have reached. When the regeneration of the axis cylinders is complete, tapping no longer causes tingling. It usually takes about one hundred days for this stage to be reached.

Tinel's sign is present before voluntary movement, muscular tone, or the normal electrical reactions reappear.

In cases of complete nerve paralysis that have not been operated upon, the tingling test is helpful in determining whether or not regeneration is taking place. Its detection may prevent an unnecessary operation being performed.

Primary suture should not be attempted so long as the wound shows signs of infection, as it is almost certain to end in failure. The ends should be sutured, however, as soon as the wound is aseptic or has healed.

#Secondary Suture.--The term secondary suture is applied to the operation of stitching the ends of the divided nerve after the wound has healed.

Results of Secondary Suture.--When secondary suture has been performed under favourable conditions, the prognosis is good, but a longer time is required for restoration of function than after primary suture. Purves Stewart says protopathic sensation is sometimes observed much earlier

than in primary suture, because partial regeneration of axis cylinders in the peripheral segment has already taken place. Sensation is recovered first, but it seldom returns before three or four months. There then follows an improvement or disappearance of any trophic disturbances that may be present. Recovery of motion may be deferred for long periods--rather because of the changes in the muscles than from want of conductivity in the nerve--and if the muscles have undergone complete degeneration, it may never take place at all. While waiting for recovery, every effort should be made to maintain the nutrition of the damaged nerve, and of the parts which it supplies.

When suture is found to be impossible, recourse must be had to other methods, known as nerve bridging and nerve implantation.

#Incomplete Division of a Mixed Nerve.--The effects of partial division of a mixed nerve vary according to the destination of the nerve bundles that have been interrupted. Within their area of distribution the paralysis is as complete as if the whole trunk had been cut across. The uninjured nerve-bundles continue to transmit impulses with the result that there is a dissociated paralysis within the distribution of the affected nerve, some muscles continuing to act and to respond normally to electric stimulation, while others behave as if the whole nerve-trunk had been severed.

In addition to vasomotor and trophic changes, there is often severe pain of a burning kind (causalgia or thermalgia) which comes on about a fortnight after the injury and causes intense and continuous suffering which may last for months. Paroxysms of pain may be excited by the slightest touch or by heat, and the patient usually learns for himself that the constant application of cold wet cloths allays the pain. The thermalgic area sweats profusely.

Operative treatment is indicated where there is no sign of improvement within three months, when recovery is arrested before complete restoration of function is attained, or when thermalgic pain is excessive.

#Subcutaneous Injuries of Nerves.--Several varieties of subcutaneous injuries of nerves are met with. One of the best known is the compression paralysis of the nerves of the upper arm which results from sleeping with the arm resting on the back of a chair or the edge of a table--the so-called "drunkard's palsy"; and from the pressure of a crutch in the axilla--"crutch paralysis." In some of these injuries, notably "drunkard's palsy," the disability appears to be due not to damage of the nerve, but to overstretching of the extensors of the wrist and fingers (Jones). A similar form of paralysis is sometimes met with from the pressure of a tourniquet, from tight bandages or splints, from the pressure exerted by a dislocated bone or by excessive callus, and from hyper-extension of the arm during anaesthesia.

In all these forms there is impaired sensation, rarely amounting to anaesthesia, marked muscular wasting, and diminution or loss of voluntary motor power, while--and this is a point of great importance--the normal electrical reactions are preserved. There may also develop trophic changes such as blisters, superficial ulcers, and clubbing of the tips of the fingers. The prognosis is usually favourable, as recovery is the rule within from one to three months. If, however, neuritis supervenes, the electrical reactions are altered, the muscles degenerate, and recovery may be retarded or may fail to take place.

Injuries which act abruptly or instantaneously are illustrated in the crushing of a nerve by the sudden displacement of a sharp-edged fragment of bone, as may occur in comminuted fractures of the humerus. The symptoms include palsy or loss of sensation, motor paralysis, and atrophy of muscles, which show the reaction of degeneration from the eighth day onwards. The presence of the reaction of degeneration influences both the prognosis and the treatment, for it implies a lesion which is probably incapable of spontaneous recovery, and which can only be remedied by operation.

The treatment varies with the cause and nature of the lesion. When, for example, a displaced bone or a mass of callus is pressing upon the nerve, steps must be taken to relieve the pressure, by operation if necessary. When there is reason to believe that the nerve is severely crushed or torn across, it should be exposed by incision, and, after removal of the damaged ends, should be united by sutures. When it is impossible to make a definite diagnosis as to the state of the nerve, it is better to expose it by operation, and thus learn the exact state of affairs without delay; in the event of the nerve being torn, the ends should be united by sutures.

#Dislocation of Nerves.--This injury, which resembles the dislocation of tendons from their grooves, is seldom met with except in the ulnar nerve at the elbow, and is described with injuries of that nerve.

DISEASES OF NERVES

#Traumatic Neuritis.--This consists in an overgrowth of the connective-tissue framework of a nerve, which causes irritation and pressure upon the nerve fibres, sometimes resulting in their degeneration. It may originate in connection with a wound in the vicinity of a nerve, as, for example, when the brachial nerves are involved in scar tissue subsequent to an operation for clearing out the axilla for cancer; or in contusion and compression of a nerve--for example, by the pressure of the head of the humerus in a dislocation of the shoulder. Some weeks or months after the injury, the patient complains of increasing hyperesthesia and of neuralgic pains in the course of the nerve. The nerve is very sensitive to pressure, and, if superficial, may be felt to be swollen. The associated muscles are wasted and weak, and are subject to twitchings. There are also trophic disturbances. It is rare to have complete sensory and motor paralysis. The disease is commonest in the nerves of the upper extremity, and the hand may become crippled and useless.

Treatment.--Any constitutional condition which predisposes to neuritis, such as gout, diabetes, or syphilis, must receive appropriate treatment. The symptoms may be relieved by rest and by soothing applications, such as belladonna, ichthyol, or menthol, by the use of hot-air and electric baths, and in obstinate cases by blistering or by the application of Corrigan's button. When such treatment fails the nerve may be stretched, or, in the case of a purely sensory trunk, a portion may be excised. Local causes, such as involvement of the nerve in a scar or in adhesions, may afford indications for operative treatment.

#Multiple Peripheral Neuritis.--Although this disease mainly comes under the cognizance of the physician, it may be attended with phenomena which call for surgical interference. In this country it is commonly due to alcoholism, but it may result from diabetes or from chronic poisoning with lead or arsenic, or from bacterial infections and intoxications such as occur in diphtheria, gonorrhoea, syphilis, leprosy, typhoid, influenza, beri-beri, and many other diseases.

It is, as a rule, widely distributed throughout the peripheral nerves, but the distribution frequently varies with the cause--the alcoholic form, for example, mainly affecting the legs, the diphtheritic form the soft palate and pharynx, and that associated with lead poisoning the forearms. The essential lesion is a degeneration of the conducting fibres of the affected nerves, and the prominent symptoms are the result of this. In alcoholic neuritis there is great tenderness of the muscles. When the legs are affected the patient may be unable to walk, and the toes may droop and the heel be drawn up, resulting in one variety of pes equino-varus. Pressure sores and perforating ulcer of the foot are the most important trophic phenomena.

Apart from the medical treatment, measures must be taken to prevent deformity, especially when the legs are affected. The bedclothes are supported by a cage, and the foot maintained at right angles to the leg by sand-bags or splints. When the disease is subsiding, the nutrition of

the damaged nerves and muscles should be maintained by massage, baths, passive movements, and the use of the galvanic current. When deformity has been allowed to take place, operative measures may be required for its correction.

NEUROMA[5]

[5] We have followed the classification adopted by Alexis Thomson in his work _On Neuroma, and Neuro-fibromatosis_ (Edinburgh: 1900).

Neuroma is a clinical term applied to all tumours, irrespective of their structure, which have their seat in nerves.

A tumour composed of newly formed nerve tissue is spoken of as a #true neuroma#; when ganglionic cells are present in addition to nerve fibres, the name _ganglionic neuroma_ is applied. These tumours are rare, and are chiefly met with in the main cords or abdominal plexuses of the sympathetic system of children or young adults. They are quite insensitive, and their removal is only called for if they cause pain or show signs of malignancy.

A #false neuroma# is an overgrowth of the sheath of a nerve. This overgrowth may result in the formation of a circumscribed tumour, or may take the form of a diffuse fibromatosis.

The circumscribed or solitary tumour grows from the sheath of a nerve which is otherwise healthy, and it may be innocent or malignant.

The innocent form is usually fibrous or myxomatous, and is definitely encapsulated. It may become cystic as a result of haemorrhage or of myxomatous degeneration. It grows very slowly, is usually elliptical in shape, and the solid form is rarely larger than a hazel-nut. The nerve fibres may be spread out all round the tumour, or may run only on one side of it. When subcutaneous and related to the smaller unnamed cutaneous nerves, it is known as a _painful subcutaneous nodule_ or _tuberclle_. It is chiefly met with about the ankle, and most often in women. It is remarkably sensitive, even gentle handling causing intense pain, which usually radiates to the periphery of the nerve affected. When related to a deeper, named nerve-trunk, it is known as a _trunk-neuroma_. It is usually less sensitive than the "subcutaneous nodule," and rarely gives rise to motor symptoms unless it involves the nerve roots where they pass through bony canals.

A trunk-neuroma is recognised clinically by its position in the line of a nerve, by the fact that it is movable in the transverse axis of the nerve but not in its long axis, and by being unduly painful and sensitive.

[Illustration: FIG. 85---Amputation Stump of Upper Arm, showing bulbous thickening of the ends of the nerves, embedded in scar tissue at the apex of the stump.]

Treatment.--If the tumour causes suffering it should be removed, preferably by shelling it out from the investing nerve sheath or capsule. In the subcutaneous nodule the nerve is rarely recognisable, and is usually sacrificed. When removal of the tumour is incomplete, a tube of radium should be inserted into the cavity, to prevent recurrence of the tumour in a malignant form.

The malignant neuroma is a sarcoma growing from the sheath of a nerve. It has the same characters and clinical features as the innocent variety, only it grows more rapidly, and by destroying the nerve fibres causes motor symptoms--jerks followed by paralysis. The sarcoma tends to spread along the lymph spaces in the long axis of the nerve, as well as to implicate the surrounding tissues, and it is liable to give rise to secondary growths. The malignant neuroma is met with chiefly in the sciatic and other large nerves of the limbs.

The _treatment_ is conducted on the same lines as sarcoma in other

situations; the insertion of a tube of radium after removal of the tumour diminishes the tendency to recurrence; a portion of the nerve-trunk being sacrificed, means must be taken to bridge the gap. In inoperable cases it may be possible to relieve pain by excising a portion of the nerve above the tumour, or, when this is impracticable, by resecting the posterior nerve roots and their ganglia within the vertebral canal.

The so-called amputation neuroma has already been referred to (p. 344).

Diffuse or Generalised Neuro-Fibromatosis--Recklinghausen's Disease.--These terms are now used to include what were formerly known as "multiple neuromata," as well as certain other overgrowths related to nerves. The essential lesion is an overgrowth of the endoneurial connective tissue throughout the nerves of both the cerebro-spinal and sympathetic systems. The nerves are diffusely and unequally thickened, so that small twigs may become enlarged to the size of the median, while at irregular intervals along their course the connective-tissue overgrowth is exaggerated so as to form tumour-like swellings similar to the trunk-neuroma already described. The tumours, which vary greatly in size and number--as many as a thousand have been counted in one case--are enclosed in a capsule derived from the perineurium. The fibromatosis may also affect the cranial nerves, the ganglia on the posterior nerve roots, the nerves within the vertebral canal, and the sympathetic nerves and ganglia, as well as the continuations of the motor nerves within the muscles. The nerve fibres, although mechanically displaced and dissociated by the overgrown endoneurium, undergo no structural change except when compressed in passing through a bony canal.

The disease probably originates before birth, although it may not make its appearance till adolescence or even till adult life. It is sometimes met with in several members of one family. It is recognised clinically by the presence of multiple tumours in the course of the nerves, and sometimes by palpable enlargement of the superficial nerve-trunks (Fig. 86). The tumours resemble the solitary trunk-neuroma, are usually quite insensitive, and many of them are unknown to the patient. As a result of injury or other exciting cause, however, one or other tumour may increase in size and become extremely sensitive; the pain is then agonising; it is increased by handling, and interferes with sleep. In these conditions, a malignant transformation of the fibroma into sarcoma is to be suspected. Motor disturbances are exceptional, unless in the case of tumours within the vertebral canal, which press on the spinal medulla and cause paraplegia.

[Illustration: FIG. 86.--Diffuse enlargement of Nerves in generalised Neuro-fibromatosis.

(After R. W. Smith.)]

Neuro-fibromatosis is frequently accompanied by pigmentation of the skin in the form of brown spots or patches scattered over the trunk.

The disease is often stationary for long periods. In progressive cases the patient becomes exhausted, and usually dies of some intercurrent affection, particularly phthisis. The treatment is restricted to relieving symptoms and complications; removal of one of the tumours is to be strongly deprecated.

In a considerable proportion of cases one of the multiple tumours takes on the characters of a malignant growth ("secondary malignant neuroma," Garre). This malignant transformation may follow upon injury, or on an unsuccessful attempt to remove the tumour. The features are those of a rapidly growing sarcoma involving a nerve-trunk, with agonising pain and muscular cramps, followed by paralysis from destruction of the nerve fibres. The removal of the tumour is usually followed by recurrence, so that high amputation is the only treatment to be recommended. Metastasis to internal organs is exceptional.

[Illustration: FIG. 87.--Plexiform Neuroma of small Sciatic Nerve, from

a girl aet. 16.

(Mr. Annandale's case.)]

There are other types of neuro-fibromatosis which require brief mention.

The plexiform neuroma (Fig. 87) is a fibromatosis confined to the distribution of one or more contiguous nerves or of a plexus of nerves, and it may occur either by itself or along with multiple tumours of the nerve-trunks and with pigmentation of the skin. The clinical features are those of an ill-defined swelling composed of a number of tortuous, convoluted cords, lying in a loose areolar tissue and freely movable on one another. It is rarely the seat of pain or tenderness. It most often appears in the early years of life, sometimes in relation to a pigmented or hairy mole. It is of slow growth, may remain stationary for long periods, and has little or no tendency to become malignant. It is usually subcutaneous, and is frequently situated on the head or neck in the distribution of the trigeminal or superficial cervical nerves. There is no necessity for its removal, but this may be indicated because of disfigurement, especially on the face or scalp or because its bulk interferes with function. When involving the ophthalmic division of the trigeminus, for example, it may cause enlargement of the upper lid and proptosis, with danger to the function of the globe. The results of excision are usually satisfactory, even if the removal is not complete.

[Illustration: FIG. 88.--Multiple Neuro-fibromas of Skin (Molluscum fibrosum, or Recklinghausen's disease).]

The cutaneous neuro-fibroma or molluscum fibrosum has been shown by Recklinghausen to be a soft fibroma related to the terminal filaments of one of the cutaneous nerves (Fig. 88). The disease appears in the form of multiple, soft, projecting tumours, scattered all over the body, except the palms of the hands and soles of the feet. The tumours are of all sizes, some being no larger than a pin's head, whilst many are as big as a filbert and a few even larger. Many are sessile and others are distinctly pedunculated, but all are covered with skin. They are mobile, soft to the touch, and of the consistence of firm fat. In exceptional cases one of the skin tumours may attain an enormous size and cause a hideous deformity, hanging down by its own weight in lobulated or folded masses (pachy-dermatocele). The treatment consists in removing the larger swellings. In some cases molluscum fibrosum is associated with pigmentation of the skin and with multiple tumours of the nerve-trunks. The small multiple tumours rarely call for interference.

[Illustration: FIG. 89.--Elephantiasis Neuromatosa in a woman aet. 28]

Elephantiasis neuromatosa is the name applied by Virchow to a condition in which a limb is swollen and misshapen as a result of the extension of a neuro-fibromatosis to the skin and subcutaneous cellular tissue of the extremity as a whole (Fig. 89). It usually begins in early life without apparent cause, and it may be associated with multiple tumours of the nerve-trunks. The inconvenience caused by the bulk and weight of the limb may justify its removal.

SURGERY OF THE INDIVIDUAL NERVES[6]

[6] We desire here to acknowledge our indebtedness to Mr. James Sherren's work on Injuries of Nerves and their Treatment.

#The Brachial Plexus.#--Lesions of the brachial plexus may be divided into those above the clavicle and those below that bone.

In the #supra-clavicular injuries#, the violence applied to the head or shoulder causes over-stretching of the anterior branches (primary divisions) of the cervical nerves, the fifth, or the fifth and sixth being those most liable to suffer. Sometimes the traction is exerted upon the plexus from below, as when a man in falling from a height endeavours to save himself by clutching at some projection, and the lesion then mainly affects the first dorsal nerve. There is tearing of

the nerve sheaths, with haemorrhage, but in severe cases partial or complete severance of nerve fibres may occur and these give way at different levels. During the healing process an excess of fibrous tissue is formed, which may interfere with regeneration.

Post-anaesthetic paralysis occurs in patients in whom, during the course of an operation, the arm is abducted and rotated laterally or extended above the head, causing over-stretching of the plexus, especially of the fifth, or fifth and sixth, anterior branches.

A cervical rib may damage the plexus by direct pressure, the part usually affected being the medial cord, which is made up of fibres from the eighth cervical and first dorsal nerves.

When a lesion of the plexus complicates a fracture of the clavicle, the nerve injury is due, not to pressure on or laceration of the nerves by fragments of bone, but to the violence causing the fracture, and this is usually applied to the point of the shoulder.

Penetrating wounds, apart from those met with in military practice, are rare.

In the #infra-clavicular injuries#, the lesion most often results from the pressure of the dislocated head of the humerus; occasionally from attempts made to reduce the dislocation by the heel-in-the-axilla method, or from fracture of the upper end of the humerus or of the neck of the scapula. The whole plexus may suffer, but more frequently the medial cord is alone implicated.

Clinical Features.--Three types of lesion result from indirect violence: the whole plexus; the upper-arm type; and the lower-arm type.

When the whole plexus is involved, sensibility is lost over the entire forearm and hand and over the lateral surface of the arm in its distal two-thirds. All the muscles of the arm, forearm, and hand are paralysed, and, as a rule, also the pectorals and spinati, but the rhomboids and serratus anterior escape. There is paralysis of the sympathetic fibres to the eye and orbit, with narrowing of the palpebral fissure, recession of the globe, and the pupil is slow to dilate when shaded from the light.

The upper-arm type--Erb-Duchenne paralysis--is that most frequently met with, and it is due to a lesion of the fifth anterior branch, or, it may be, also of the sixth. The position of the upper limb is typical: the arm and forearm hang close to the side, with the forearm extended and pronated; the deltoid, spinati, biceps, brachialis, and supinators are paralysed, and in some cases the radial extensors of the wrist and the pronator teres are also affected. The patient is unable to supinate the forearm or to abduct the arm, and in most cases to flex the forearm. He may, however, regain some power of flexing the forearm when it is fully pronated, the extensors of the wrist becoming feeble flexors of the elbow. There is, as a rule, no loss of sensibility, but complaint may be made of tickling and of pins-and-needles over the lateral aspect of the arm. The abnormal position of the limb may persist although the muscles regain the power of voluntary movement, and as the condition frequently follows a fall on the shoulder, great care is necessary in diagnosis, as the condition is apt to be attributed to an injury to the axillary (circumflex) nerve.

The lower-arm type of paralysis, associated with the name of Klumpke, is usually due to over-stretching of the plexus, and especially affects the anterior branch of the first dorsal nerve. In typical cases all the intrinsic muscles of the hand are affected, and the hand assumes the claw shape. Sensibility is usually altered over the medial side of the arm and forearm, and there is paralysis of the sympathetic.

Infra-clavicular injuries, as already stated, are most often produced by a sub-coracoid dislocation of the humerus; the medial cord is that most frequently injured, and the muscles paralysed are those supplied by the ulnar nerve, with, in addition, those intrinsic muscles of the hand

supplied by the median. Sensibility is affected over the medial surface of the forearm and ulnar area of the hand. Injury of the lateral and posterior cords is very rare.

Treatment is carried out on the lines already laid down for nerve injuries in general. It is impossible to diagnose between complete and incomplete rupture of the nerve cords, until sufficient time has elapsed to allow of the establishment of the reaction of degeneration. If this is present at the end of fourteen days, operation should not be delayed. Access to the cords of the plexus is obtained by a dissection similar to that employed for the subclavian artery, and the nerves are sought for as they emerge from under cover of the scalenus anterior, and are then traced until the seat of injury is found. In the case of the first dorsal nerve, it may be necessary temporarily to resect the clavicle. The usual after-treatment must be persisted in until recovery ensues, and care must be taken that the paralysed muscles do not become over-stretched. The prognosis is less favourable in the supra-clavicular lesions than in those below the clavicle, which nearly always recover without surgical intervention.

In the brachial birth-paralysis met with in infants, the lesion is due to over-stretching of the plexus, and is nearly always of the Erb-Duchenne type. The injury is usually unilateral, it occurs with almost equal frequency in breech and in vertex presentations, and the left arm is more often affected than the right. The lesion is seldom recognised at birth. The first symptom noticed is tenderness in the supra-clavicular region, the child crying when this part is touched or the arm is moved. The attitude may be that of the Erb-Duchenne type, or the whole of the muscles of the upper limb may be flaccid, and the arm hangs powerless. A considerable proportion of the cases recover spontaneously. The arm is to be kept at rest, with the affected muscles relaxed, and, as soon as tenderness has disappeared, daily massage and passive movements are employed. The reaction of degeneration can rarely be satisfactorily tested before the child is three months old, but if it is present, an operation should be performed. After operation, the shoulder should be elevated so that no traction is exerted on the affected cords.

#The long thoracic nerve# (nerve of Bell), which supplies the serratus anterior, is rarely injured. In those whose occupation entails carrying weights upon the shoulder it may be contused, and the resulting paralysis of the serratus is usually combined with paralysis of the lower part of the trapezius, the branches from the third and fourth cervical nerves which supply this muscle also being exposed to pressure as they pass across the root of the neck. There is complaint of pain above the clavicle, and winging of the scapula; the patient is unable to raise the arm in front of the body above the level of the shoulder or to perform any forward pushing movements; on attempting either of these the winging of the scapula is at once increased. If the scapula is compared with that on the sound side, it is seen that, in addition to the lower angle being more prominent, the spine is more horizontal and the lower angle nearer the middle line. The majority of these cases recover if the limb is placed at absolute rest, the elbow supported, and massage and galvanism persevered with. If the paralysis persists, the sterno-costal portion of the pectoralis major may be transplanted to the lower angle of the scapula.

The long thoracic nerve may be cut across while clearing out the axilla in operating for cancer of the breast. The displacement of the scapula is not so marked as in the preceding type, and the patient is able to perform pushing movements below the level of the shoulder. If the reaction of degeneration develops, an operation may be performed, the ends of the nerve being sutured, or the distal end grafted into the posterior cord of the brachial plexus.

#The Axillary (Circumflex) Nerve.#--In the majority of cases in which paralysis of the deltoid follows upon an injury of the shoulder, it is due to a lesion of the fifth cervical nerve, as has already been described in injuries of the brachial plexus. The axillary nerve itself as it passes round the neck of the humerus is most liable to be injured

from the pressure of a crutch, or of the head of the humerus in sub-glenoid dislocation, or in fracture of the neck of the scapula or of the humerus. In miners, who work for long periods lying on the side, the muscle may be paralysed by direct pressure on the terminal filaments of the nerve, and the nerve may also be involved as a result of disease in the sub-deltoid bursa.

The deltoid is wasted, and the acromion unduly prominent. In recent cases paralysis of the muscle is easily detected. In cases of long standing it is not so simple, because other muscles, the spinati, the clavicular fibres of the pectoral and the serratus, take its place and elevate the arm; there is always loss of sensation on the lateral aspect of the shoulder. There is rarely any call for operative treatment, as the paralysis is usually compensated for by other muscles.

When the supra-scapular nerve is contused or stretched in injuries of the shoulder, the spinati muscles are paralysed and wasted, the spine of the scapula is unduly prominent, and there is impairment in the power of abducting the arm and rotating it laterally.

The musculo-cutaneous nerve is very rarely injured; when cut across, there is paralysis of the coraco-brachialis, biceps, and part of the brachialis, but no movements are abolished, the forearm being flexed, in the pronated position, by the brachio-radialis and long radial extensor of the wrist; in the supinated position, by that portion of the brachialis supplied by the radial nerve. Supination is feebly performed by the supinator muscle. Protopathic and epicritic sensibility are lost over the radial side of the forearm.

#Radial (Musculo-Spiral) Nerve.--From its anatomical relationships this trunk is more exposed to injury than any other nerve in the body. It is frequently compressed against the humerus in sleeping with the arm resting on the back of a chair, especially in the deep sleep of alcoholic intoxication (drunkard's palsy). It may be pressed upon by a crutch in the axilla, by the dislocated head of the humerus, or by violent compression of the arm, as when an elastic tourniquet is applied too tightly. The most serious and permanent injuries of this nerve are associated with fractures of the humerus, especially those from direct violence attended with comminution of the bone. The nerve may be crushed or torn by one of the fragments at the time of the injury, or at a later period may be compressed by callus.

Clinical Features.--Immediately after the injury it is impossible to tell whether the nerve is torn across or merely compressed. The patient may complain of numbness and tingling in the distribution of the superficial branch of the nerve, but it is a striking fact, that so long as the nerve is divided below the level at which it gives off the dorsal cutaneous nerve of the forearm (external cutaneous branch), there is no loss of sensation. When it is divided above the origin of the dorsal cutaneous branch, or when the dorsal branch of the musculo-cutaneous nerve is also divided, there is a loss of sensibility on the dorsum of the hand.

The motor symptoms predominate, the muscles affected being the extensors of the wrist and fingers, and the supinators. There is a characteristic "drop-wrist"; the wrist is flexed and pronated, and the patient is unable to dorsiflex the wrist or fingers (Fig. 90). If the hand and proximal phalanges are supported, the second and third phalanges may be partly extended by the interossei and lumbricals. There is also considerable impairment of power in the muscles which antagonise those that are paralysed, so that the grasp of the hand is feeble, and the patient almost loses the use of it; in some cases this would appear to be due to the median nerve having been injured at the same time.

[Illustration: FIG. 90.--Drop-wrist following Fracture of Shaft of Humerus.]

If the lesion is high up, as it is, for example, in crutch paralysis, the triceps and anconeus may also suffer.

Treatment.--The slighter forms of injury by compression recover under massage, douching, and electricity. If there is drop-wrist, the hand and forearm are placed on a palmar splint, with the hand dorsiflexed to nearly a right angle, and this position is maintained until voluntary dorsiflexion at the wrist returns to the normal. Recovery is sometimes delayed for several months.

In the more severe injuries associated with fracture of the humerus and attended with the reaction of degeneration, it is necessary to cut down upon the nerve and free it from the pressure of a fragment of bone or from callus or adhesions. If the nerve is torn across, the ends must be sutured, and if this is impossible owing to loss of tissue, the gap may be bridged by a graft taken from the superficial branch of the radial nerve, or the ends may be implanted into the median.

Finally, in cases in which the paralysis is permanent and incurable, the disability may be relieved by operation. A fascial graft can be employed to act as a ligament permanently extending the wrist; it is attached to the third and fourth metacarpal bones distally and to the radius or ulna proximally. The flexor carpi radialis can then be joined up with the extensor digitorum communis by passing its tendon through an aperture in the interosseous membrane, or better still, through the pronator quadratus, as there is less likelihood of the formation of adhesions when the tendon passes through muscle than through interosseous membrane. The palmaris longus is anastomosed with the abductor pollicis longus (extensor ossis metacarpi pollicis), thus securing a fair amount of abduction of the thumb. The flexor carpi ulnaris may also be anastomosed with the common extensor of the fingers. The extensors of the wrist may be shortened, so as to place the hand in the position of dorsal flexion, and thus improve the attitude and grasp of the hand.

The superficial branch of the radial (radial nerve) and the deep branch (posterior interosseous), apart from suffering in lesions of the radial, are liable to be contused or torn in dislocation of the head of the radius, and in fracture of the neck of the bone. The deep branch may be divided as it passes through the supinator in operations on old fractures and dislocations in the region of the elbow. Division of the superficial branch in the upper two-thirds of the forearm produces no loss of sensibility; division in the lower third after the nerve has become associated with branches from the musculo-cutaneous is followed by a loss of sensibility on the radial side of the hand and thumb. Wounds on the dorsal surface of the wrist and forearm are often followed by loss of sensibility over a larger area, because the musculo-cutaneous nerve is divided as well, and some of the fibres of the lower lateral cutaneous branch of the radial.

[Illustration: FIG. 91.--To illustrate the Loss of Sensation produced by Division of the Median Nerve. The area of complete cutaneous insensibility is shaded black. The parts insensitive to light touch and to intermediate degrees of temperature are enclosed within the dotted line.]

(After Head and Sherren.)]

#The Median Nerve# is most frequently injured in wounds made by broken glass in the region of the wrist. It may also be injured in fractures of the lower end of the humerus, in fractures of both bones of the forearm, and as a result of pressure by splints. After division at the elbow, there is impairment of mobility which affects the thumb, and to a less extent the index finger: the terminal phalanx of the thumb cannot be flexed owing to the paralysis of the flexor pollicis longus, and the index can only be flexed at its metacarpo-phalangeal joint by the interosseous muscles attached to it. Pronation of the forearm is feeble, and is completed by the weight of the hand. After division at the wrist, the abductor-opponens group of muscles and the two lateral lumbricals only are affected; the abduction of the thumb can be feebly imitated by the short extensor and the long abductor (ext. ossis metacarpi pollicis), while opposition may be simulated by contraction of the long flexor and the short abductor of the thumb; the paralysis of the two medial lumbricals produces no symptoms that can be recognised.

It is important to remember that when the median nerve is divided at the wrist, deep touch can be appreciated over the whole of the area supplied by the nerve; the injury, therefore, is liable to be overlooked. If, however, the tendons are divided as well as the nerve, there is insensibility to deep touch. The areas of epicritic and of protopathic insensibility are illustrated in Fig. 91. The division of the nerve at the elbow, or even at the axilla, does not increase the extent of the loss of epicritic or protopathic sensibility, but usually affects deep sensibility.

[Illustration: FIG. 92.--To illustrate Loss of Sensation produced by complete Division of Ulnar Nerve. Loss of all forms of cutaneous sensibility is represented by the shaded area. The parts insensitive to light touch and to intermediate degrees of heat and cold are enclosed within the dotted line.]

(Head and Sherren.)]

#The Ulnar Nerve.#--The most common injury of this nerve is its division in transverse accidental wounds just above the wrist. In the arm it may be contused, along with the radial, in crutch paralysis; in the region of the elbow it may be injured in fractures or dislocations, or it may be accidentally divided in the operation for excising the elbow-joint.

When it is injured at or above the elbow, there is paralysis of the flexor carpi ulnaris, the ulnar half of the flexor digitorum profundus, all the interossei, the two medial lumbricals, and the adductors of the thumb. The hand assumes a characteristic attitude: the index and middle fingers are extended at the metacarpo-phalangeal joints owing to paralysis of the interosseous muscles attached to them; the little and ring fingers are hyper-extended at these joints in consequence of the paralysis of the lumbricals; all the fingers are flexed at the inter-phalangeal joints, the flexion being most marked in the little and ring fingers--claw-hand or main en griffe. On flexing the wrist, the hand is tilted to the radial side, but the paralysis of the flexor carpi ulnaris is often compensated for by the action of the palmaris longus. The little and ring fingers can be flexed to a slight degree by the slips of the flexor sublimis attached to them and supplied by the median nerve; flexion of the terminal phalanx of the little finger is almost impossible. Adduction and abduction movements of the fingers are lost. Adduction of the thumb is carried out, not by the paralysed adductor pollicis, but the movement may be simulated by the long flexor and extensor muscles of the thumb. Epicritic sensibility is lost over the little finger, the ulnar half of the ring finger, and that part of the palm and dorsum of the hand to the ulnar side of a line drawn longitudinally through the ring finger and continued upwards. Protopathic sensibility is lost over an area which varies in different cases. Deep sensibility is usually lost over an area almost as extensive as that of protopathic insensibility.

When the nerve is divided at the wrist, the adjacent tendons are also frequently severed. If divided below the point at which its dorsal branch is given off, the sensory paralysis is much less marked, and the injury is therefore liable to be overlooked until the wasting of muscles and typical main en griffe ensue. The loss of sensibility after division of the nerve before the dorsal branch is given off resembles that after division at the elbow, except that in uncomplicated cases deep sensibility is usually retained. If the tendons are divided as well, however, deep touch is also lost.

Care must be taken in all these injuries to prevent deformity; a splint must be worn, at least during the night, until the muscles regain their power of voluntary movement, and then exercises should be instituted.

#Dislocation of the ulnar nerve# at the elbow results from sudden and violent flexion of the joint, the muscular effort causing stretching or laceration of the fascia that holds the nerve in its groove; it is predisposed to if the groove is shallow as a result of imperfect development of the medial condyle of the humerus, and by cubitus valgus.

The nerve slips forward, and may be felt lying on the medial aspect of the condyle. It may retain this position, or it may slip backwards and forwards with the movements of the arm. The symptoms at the time of the displacement are some disability at the elbow, and pain and tingling along the nerve, which are exaggerated by movement and by pressure. The symptoms may subside altogether, or a neuritis may develop, with severe pain shooting up the nerve.

The dislocated nerve is easily replaced, but is difficult to retain in position. In recent cases the arm may be placed in the extended position with a pad over the condyle, care being taken to avoid pressure on the nerve. Failing relief, it is better to make a bed for the nerve by dividing the deep fascia behind the medial condyle and to stitch the edges of the fascia over the nerve. This operation has been successful in all the recorded cases.

#The Sciatic Nerve.--When this nerve is compressed, as by sitting on a fence, there is tingling and powerlessness in the limb as a whole, known as "sleeping" of the limb, but these phenomena are evanescent. Injuries to the great sciatic nerve are rare except in war. Partial division is more common than complete, and it is noteworthy that the fibres destined for the peroneal nerve are more often and more severely injured than those for the tibial (internal popliteal). After complete division, all the muscles of the leg are paralysed; if the section is in the upper part of the thigh, the hamstrings are also paralysed. The limb is at first quite powerless, but the patient usually recovers sufficiently to be able to walk with a little support, and although the hamstrings are paralysed the knee can be flexed by the sartorius and gracilis. The chief feature is drop-foot. There is also loss of sensation below the knee except along the course of the long saphenous nerve on the medial side of the leg and foot. Sensibility to deep touch is only lost over a comparatively small area on the dorsum of the foot.

#The Common Peroneal (external popliteal) nerve# is exposed to injury where it winds round the neck of the fibula, because it is superficial and lies against the unyielding bone. It may be compressed by a tourniquet, or it may be bruised or torn in fractures of the upper end of the bone. It has been divided in accidental wounds,--by a scythe, for example,--in incising for cellulitis, and in performing subcutaneous tenotomy of the biceps tendon. Cases have been observed of paralysis of the nerve as a result of prolonged acute flexion of the knee in certain occupations.

When the nerve is divided, the most obvious result is "drop-foot"; the patient is unable to dorsiflex the foot and cannot lift his toes off the ground, so that in walking he is obliged to jerk the foot forwards and laterally. The loss of sensibility depends upon whether the nerve is divided above or below the origin of the large cutaneous branch which comes off just before it passes round the neck of the fibula. In course of time the foot becomes inverted and the toes are pointed--pes equino-varus--and trophic sores are liable to form.

#The Tibial (internal popliteal) nerve# is rarely injured.

#The Cranial nerves# are considered with affections of the head and neck (Vol. II.).

NEURALGIA

The term neuralgia is applied clinically to any pain which follows the course of a nerve, and is not referable to any discoverable cause. It should not be applied to pain which results from pressure on a nerve by a tumour, a mass of callus, an aneurysm, or by any similar gross lesion. We shall only consider here those forms of neuralgia which are amenable to surgical treatment.

#Brachial Neuralgia.--The pain is definitely located in the distribution of one of the branches or nerve roots, is often intermittent, and is usually associated with tingling and disturbance of

tactile sensation. The root of the neck should be examined to exclude pressure as the cause of the pain by a cervical rib, a tumour, or an aneurysm. When medical treatment fails, the nerve-trunks may be injected with saline solution or recourse may be had to operative measures, the affected cords being exposed and stretched through an incision in the posterior triangle of the neck. If this fails to give relief, the more serious operation of resecting the posterior roots of the affected nerves within the vertebral canal may be considered.

Neuralgia of the sciatic nerve--#sciatica#--is the most common form of neuralgia met with in surgical practice.

It is chiefly met with in adults of gouty or rheumatic tendencies who suffer from indigestion, constipation, and oxaluria--in fact, the same type of patients who are liable to lumbago, and the two affections are frequently associated. In hospital practice it is commonly met with in coal-miners and others who assume a squatting position at work. The onset of the pain may follow over-exertion and exposure to cold and wet, especially in those who do not take regular exercise. Any error of diet or indulgence in beer or wine may contribute to its development.

The essential symptom is paroxysmal or continuous pain along the course of the nerve in the buttock, thigh, or leg. It may be comparatively slight, or it may be so severe as to prevent sleep. It is aggravated by movement, so that the patient walks lame or is obliged to lie up. It is aggravated also by any movement which tends to put the nerve on the stretch, as in bending down to put on the shoes, such movements also causing tingling down the nerve, and sometimes numbness in the foot. This may be demonstrated by flexing the thigh on the abdomen, the knee being kept extended; there is no pain if the same manoeuvre is repeated with the knee flexed. The nerve is sensitive to pressure, the most tender points being its emergence from the greater sciatic foramen, the hollow between the trochanter and the ischial tuberosity, and where the common peroneal nerve winds round the neck of the fibula. The muscles of the thigh are often wasted and are liable to twitch.

The clinical features vary a good deal in different cases; the affection is often obstinate, and may last for many weeks or even months.

In the sciatica that results from neuritis and perineuritis, there is marked tenderness on pressure due to the involvement of the nerve filaments in the sheath of the nerve, and there may be patches of cutaneous anaesthesia, loss of tendon reflexes, localised wasting of muscles, and vaso-motor and trophic changes. The presence of the reaction of degeneration confirms the diagnosis of neuritis. In long-standing cases the pain and discomfort may lead to a postural scoliosis (ischias-scoliotica).

Diagnosis.--Pain referred along the course of the sciatic nerve on one side, or, as is sometimes the case, on both sides, is a symptom of tumours of the uterus, the rectum, or the pelvic bones. It may result also from the pressure of an abscess or an aneurysm either inside the pelvis or in the buttock, and is sometimes associated with disease of the spinal medulla, such as tabes. Gluteal fibrosis may be mistaken for sciatica. It is also necessary to exclude such conditions as disease in the hip or sacro-iliac joint, especially tuberculous disease and arthritis deformans, before arriving at a diagnosis of sciatica. A digital examination of the rectum or vagina is of great value in excluding intra-pelvic tumours.

Treatment is both general and local. Any constitutional tendency, such as gout or rheumatism, must be counteracted, and indigestion, oxaluria, and constipation should receive appropriate treatment. In acute cases the patient is confined to bed between blankets, the limb is wrapped in thermogene wool, and the knee is flexed over a pillow; in some cases relief is experienced from the use of a long splint, or slinging the leg in a Salter's cradle. A rubber hot-bottle may be applied over the seat of greatest pain. The bowels should be well opened by castor oil or by calomel followed by a saline. Salicylate of soda in full doses, or aspirin, usually proves effectual in relieving pain, but when this is

very intense it may call for injections of heroin or morphin. Potassium iodide is of benefit in chronic cases.

Relief usually results from bathing, douching, and massage, and from repeated gentle stretching of the nerve. This may be carried out by passive movements of the limb--the hip being flexed while the knee is kept extended; and by active movements--the patient flexing the limb at the hip, the knee being maintained in the extended position. These exercises, which may be preceded by massage, are carried out night and morning, and should be practised systematically by those who are liable to sciatica.

Benefit has followed the injection into the nerve itself, or into the tissues surrounding it, of normal saline solution; from 70-100 c.c. are injected at one time. If the pain recurs, the injection may require to be repeated on many occasions at different points up and down the nerve. Needling or acupuncture consists in piercing the nerve at intervals in the buttock and thigh with long steel needles. Six or eight needles are inserted and left in position for from fifteen to thirty minutes.

In obstinate and severe cases the nerve may be forcibly stretched. This may be done bloodlessly by placing the patient on his back with the hip flexed to a right angle, and then gradually extending the knee until it is in a straight line with the thigh (Billroth). A general anaesthetic is usually required. A more effectual method is to expose the nerve through an incision at the fold of the buttock, and forcibly pull upon it. This operation is most successful when the pain is due to the nerve being involved in adhesions.

#Trigeminal Neuralgia.--A severe form of epileptiform neuralgia occurs in the branches of the fifth nerve, and is one of the most painful affections to which human flesh is liable. So far as its pathology is known, it is believed to be due to degenerative changes in the semilunar (Gasserian) ganglion. It is met with in adults, is almost invariably unilateral, and develops without apparent cause. The pain, which occurs in paroxysms, is at first of moderate severity, but gradually becomes agonising. In the early stages the paroxysms occur at wide intervals, but later they recur with such frequency as to be almost continuous. They are usually excited by some trivial cause, such as moving the jaws in eating or speaking, touching the face as in washing, or exposure to a draught of cold air. Between the paroxysms the patient is free from pain, but is in constant terror of its return, and the face wears an expression of extreme suffering and anxiety. When the paroxysm is accompanied by twitching of the facial muscles, it is called spasmodic tic.

The skin of the affected area may be glazed and red, or may be pale and moist with inspissated sweat, the patient not daring to touch or wash it.

There is excessive tenderness at the points of emergence of the different branches on the face, and pressure over one or other of these points may excite a paroxysm. In typical cases the patient is unable to take any active part in life. The attempt to eat is attended with such severe pain that he avoids taking food. In some cases the suffering is so great that the patient only obtains sleep by the use of hypnotics, and he is often on the verge of suicide.

Diagnosis.--There is seldom any difficulty in recognising the disease. It is important, however, to exclude the hysterical form of neuralgia, which is characterised by its occurrence earlier in life, by the pain varying in situation, being frequently bilateral, and being more often constant than paroxysmal.

Treatment.--Before having recourse to the measures described below, it is advisable to give a thorough trial to the medical measures used in the treatment of neuralgia.

The Injection of Alcohol into the Nerve.--The alcohol acts by destroying the nerve fibres, and must be brought into direct contact

with them; if the nerve has been properly struck the injection is followed by complete anaesthesia in the distribution of the nerve. The relief may last for from six months to three years; if the pain returns, the injection may be repeated. The strength of the alcohol should be 85 per cent., and the amount injected about 2 c.c.; a general, or preferably a local, anaesthetic (novocain) should be employed (Schlosser); the needle is 8 cm. long, and 0.7 mm. in diameter. The severe pain which the alcohol causes may be lessened, after the needle has penetrated to the necessary depth, by passing a few cubic centimetres of a 2 per cent. solution of novocain-suprarenin through it before the alcohol is injected. The treatment by injection of alcohol is superior to the resection of branches of the nerve, for though relapses occur after the treatment with alcohol, renewed freedom from pain may be obtained by its repetition. The ophthalmic division should not, however, be treated in this manner, for the alcohol may escape into the orbit and endanger other nerves in this region. Harris recommends the injection of alcohol into the semilunar ganglion.

Operative Treatment.--This consists in the removal of the affected nerve or nerves, either by resection--neurectomy; or by a combination of resection with twisting or tearing of the nerve from its central connections--avulsion. To prevent the regeneration of the nerve after these operations, the canal of exit through the bone should be obliterated; this is best accomplished by a silver screw-nail driven home by an ordinary screw-driver (Charles H. Mayo).

When the neuralgia involves branches of two or of all three trunks, or when it has recurred after temporary relief following resection of individual branches, the removal of the semilunar ganglion, along with the main trunks of the maxillary and mandibular divisions, should be considered.

The operation is a difficult and serious one, but the results are satisfactory so far as the cure of the neuralgia is concerned. There is little or no disability from the unilateral paralysis of the muscles of mastication; but on account of the insensitiveness of the cornea, the eye must be protected from irritation, especially during the first month or two after the operation; this may be done by fixing a large watch-glass around the edge of the orbit with adhesive plaster.

If the ophthalmic branch is not involved, neither it nor the ganglion should be interfered with; the maxillary and mandibular divisions should be divided within the skull, and the foramen rotundum and foramen ovale obliterated.

CHAPTER XVII

THE SKIN AND SUBCUTANEOUS TISSUE

Structure of skin--Blisters--Callosities--Corns--Chilblains--Boils--Carbuncle--Abscess--Veldt sores--Tuberculosis of skin: Inoculation tubercle--Lupus: Varieties--Sporotrichosis--Elephantiasis--Sebaceous cysts or wens--Moles--Horns--New growths: Fibroma; Papilloma; Adenoma; Epithelioma; Rodent cancer; Melanotic cancer; Sarcoma--AFFECTIONS OF CICATRICES--Varieties of scars--Keloid--Tumours--AFFECTIONS OF NAILS.

#Structure of Skin.#--The skin is composed of a superficial cellular layer--the epidermis, and the corium or true skin. The epidermis is differentiated from without inwards into the stratum corneum, the stratum lucidum, the stratum granulosum, and the rete Malpighii or germinal layer, from which all the others are developed. The corium or true skin consists of connective tissue, in which ramify the blood vessels, lymphatics, and nerves. That part of the corium immediately adjoining the epidermis is known as the papillary portion, and contains the terminal loops of the cutaneous blood vessels and the terminations

of the cutaneous nerves. The deeper portion of the true skin is known as the reticular portion, and is largely composed of adipose tissue.

#Blisters# result from the exudation of serous fluid beneath the horny layer of the epidermis. The fluid may be clear, as in the blisters of a recent burn, or blood-stained, as in the blisters commonly accompanying fractures of the leg. It may become purulent as a result of infection, and this may be the starting-point of lymphangitis or cellulitis.

The skin should be disinfected and the blisters punctured. When infected, the separated horny layer must be cut away with scissors to allow of the necessary purification.

#Callosities# are prominent, indurated masses of the horny layer of the epidermis, where it has been exposed to prolonged friction and pressure. They occur on the fingers and hand as a result of certain occupations and sports, but are most common under the balls of the toes or heel. A bursa may form beneath a callosity, and if it becomes inflamed may cause considerable suffering; if suppuration ensues, a sinus may form, resembling a perforating ulcer of the foot.

The treatment of callosities on the foot consists in removing pressure by wearing properly fitting boots, and in applying a ring pad around the callosity; another method is to fit a sock of spongiopilene with a hole cut out opposite the callosity. After soaking in hot water, the overgrown horny layer is pared away, and the part painted daily with a saturated solution of salicylic acid in flexible collodion.

[Illustration: FIG. 93.--Callosities and Corns on the Sole and Plantar Aspect of the Toes in a woman who was also the subject of flat-foot.]

#Corns.#--A corn is a localised overgrowth of the horny layer of the epidermis, which grows downwards, pressing upon and displacing the sensitive papillae of the corium. Corns are due to the friction and pressure of ill-fitting boots, and are met with chiefly on the toes and sole of the foot. A corn is usually hard, dry, and white; but it may be sodden from moisture, as in "soft corns" between the toes. A bursa may form beneath a corn, and if inflamed constitutes one form of bunion. When suppuration takes place in relation to a corn, there is great pain and disability, and it may prove the starting-point of lymphangitis.

The treatment consists in the wearing of properly fitting boots and stockings, and, if the symptoms persist, the corn should be removed. This is done after the manner of chiropodists by digging out the corn with a suitably shaped knife. A more radical procedure is to excise, under local anaesthesia, the portion of skin containing the corn and the underlying bursa. The majority of so-called corn solvents consist of a solution of salicylic acid in collodion; if this is painted on daily, the epidermis dies and can then be pared away. The unskillful paring of corns may determine the occurrence of senile gangrene in those who are predisposed to it by disease of the arteries.

[Illustration: FIG. 94.--Ulcerated Chilblains on Fingers of a Child.]

#Chilblains.#--Chilblain or erythema pernio is a vascular disturbance resulting from the alternate action of cold and heat on the distal parts of the body. Chilblains are met with chiefly on the fingers and toes in children and anaemic girls. In the mild form there is a sensation of burning and itching, the part becomes swollen, of a dusky red colour, and the skin is tense and shiny. In more severe cases the burning and itching are attended with pain, and the skin becomes of a violet or wine-red colour. There is a third degree, closely approaching frost-bite, in which the skin tends to blister and give way, leaving an indolent raw surface popularly known as a "broken chilblain."

Those liable to chilblains should take open-air exercise, nourishing food, cod-liver oil, and tonics. Woollen stockings and gloves should be worn in cold weather, and sudden changes of temperature avoided. The symptoms may be relieved by ichthyl ointment, glycerin and belladonna, or a mixture of Venice turpentine, castor oil, and collodion applied on

lint which is wrapped round the toe. Another favourite application is one of equal parts of tincture of capsicum and compound liniment of camphor, painted over the area night and morning. Balsam of Peru or resin ointment spread on gauze should be applied to broken chilblains. The most effective treatment is Bier's bandage applied for about six hours twice daily; it can be worn while the patient is following his occupation; in chronic cases this may be supplemented with hot-air baths.

#Boils and Carbuncles.--These result from infection with the *staphylococcus aureus*, which enters the orifices of the ducts of the skin under the influence of friction and pressure, as was demonstrated by the well-known experiment of Garre, who produced a crop of pustules and boils on his own forearm by rubbing in a culture of the *staphylococcus aureus*.

A #boil# results when the infection is located in a hair follicle or sebaceous gland. A hard, painful, conical swelling develops, to which, so long as the skin retains its normal appearance, the term "blind boil" is applied. Usually, however, the skin becomes red, and after a time breaks, giving exit to a drop or two of thick pus. After an interval of from six to ten days a soft white slough is discharged; this is known as the "core," and consists of the necrosed hair follicle or sebaceous gland. After the separation of the core the boil heals rapidly, leaving a small depressed scar.

Boils are most frequently met with on the back of the neck and the buttocks, and on other parts where the skin is coarse and thick and is exposed to friction and pressure. The occurrence of a number or a succession of boils is due to spread of the infection, the cocci from the original boil obtaining access to adjacent hair follicles. The spread of boils may be unwittingly promoted by the use of a domestic poultice or the wearing of infected underclothing.

While boils are frequently met with in debilitated persons, and particularly in those suffering from diabetes or Bright's disease, they also occur in those who enjoy vigorous health. They seldom prove dangerous to life except in diabetic subjects, but when they occur on the face there is a risk of lymphatic and of general pyogenic infection. Boils may be differentiated from syphilitic lesions of the skin by their acute onset and progress, and by the absence of other evidence of syphilis; and from the malignant or anthrax pustule by the absence of the central black eschar and of the circumstances which attend upon anthrax infection.

Treatment.--The skin of the affected area should be painted with iodine, and a Klapp's suction bell applied thrice daily. If pus forms, the skin is frozen with ethyl-chloride and a small incision made, after which the application of the suction bell is persevered with. The further treatment consists in the use of diluted boracic or resin ointment. In multiple boils on the trunk and limbs, lysol or boracic baths are of service; the underclothing should be frequently changed, and that which is discarded must be disinfected. In patients with recurrence of boils about the neck, re-infection frequently takes place from the scalp, to which therefore treatment should be directed.

Any impaired condition of health should be corrected; when, there is sugar or albumen in the urine the conditions on which these depend must receive appropriate treatment. When there are successive crops of boils, recourse should be had to vaccines. In refractory cases benefit has followed the subcutaneous injection of lipoid solution containing tin.

#Carbuncle# may be looked upon as an aggregation of boils, and is characterised by a densely hard base and a brownish-red discolouration of the skin. It is usually about the size of a crown-piece, but it may continue to enlarge until it attains the size of a dinner-plate. The patient is ill and feverish, and the pain may be so severe as to prevent sleep. As time goes on several points of suppuration appear, and when these burst there are formed a number of openings in the skin, giving it a cribriform appearance; these openings exude pus. The different

openings ultimately fuse and the large adherent greyish-white slough is exposed. The separation of the slough is a tedious process, and the patient may become exhausted by pain, discharge, and toxin absorption. When the slough is finally thrown off, a deep gap is left, which takes a long time to heal. A large carbuncle is a grave disease, especially in a weakly person suffering from diabetes or chronic alcoholism; we have on several occasions seen diabetic coma supervene and the patient die without recovering consciousness. In the majority of cases the patient is laid aside for several months. It is most common in male adults over forty years of age, and is usually situated on the back between the shoulders. When it occurs on the face or anterior part of the neck it is especially dangerous, because of the greater risk of dissemination of the infection.

A carbuncle is to be differentiated from an ulcerated gumma and from anthrax pustule.

[Illustration: FIG. 95.--Carbuncle of seventeen days' duration in a woman aet. 57.]

Treatment.--Pain is relieved by full doses of opium or codein, and these drugs are specially indicated when sugar is present in the urine. Vaccines may be given a trial. The diet should be liberal and easily digested, and strychnin and other stimulants may be of service. Locally the treatment is carried out on the same lines as for boils.

In some cases it is advisable to excise the carbuncle or to make incisions across it in different directions, so that the resulting wound presents a stellate appearance.

#Acute Abscesses of the Skin and Subcutaneous Tissue in Young Children.#--In young infants, abscesses are not infrequently met with scattered over the trunk and limbs, and are probably the result of infection of the sebaceous glands from dirty underclothing. The abscesses should be opened, and the further spread of infection prevented by cleansing of the skin and by the use of clean under-linen. Similar abscesses are met with on the scalp in association with eczema, impetigo, and pediculosis.

#Veldt Sore.#--This sore usually originates in an abrasion of the epidermis, such as a sun blister, the bite of an insect, or a scratch. A pustule forms and bursts, and a brownish-yellow scab forms over it. When this is removed, an ulcer is left which has little tendency to heal. These sores are most common about the hands, arms, neck, and feet, and are most apt to occur in those who have had no opportunities of washing, and who have lived for a long time on tinned foods.

#Tuberculosis of the Skin.#--Interest attaches chiefly to the primary forms of tuberculosis of the skin in which the bacilli penetrate from without--inoculation tubercle and lupus.

#Inoculation Tubercle.#--The appearances vary with the conditions under which the inoculation takes place. As observed on the fingers of adults, the affection takes the form of an indolent painless swelling, the epidermis being red and glazed, or warty, and irregularly fissured. Sometimes the epidermis gives way, forming an ulcer with flabby granulations. The infection rarely spreads to the lymphatics, but we have seen inoculation tubercle of the index-finger followed by a large cold abscess on the median side of the upper arm and by a huge mass of breaking down glands in the axilla.

In children who run about barefooted in towns, tubercle may be inoculated into wounds in the sole or about the toes, and although the local appearances may not be characteristic, the nature of the infection is revealed by its tendency to spread up the limb along the lymph vessels, giving rise to abscesses and fungating ulcers in relation to the femoral glands.

#Tuberculous Lupus.#--This is an extremely chronic affection of the skin. It rarely extends to the lymph glands, and of all tuberculous

lesions is the least dangerous to life. The commonest form of *lupus*--*lupus vulgaris*--usually commences in childhood or youth, and is most often met with on the nose or cheek. The early and typical appearance is that of brownish-yellow or pink nodules in the skin, about the size of hemp seed. Healing frequently occurs in the centre of the affected area while the disease continues to extend at the margin.

When there is actual destruction of tissue and ulceration--the so-called "*lupus excedens*" or "*ulcerans*"--healing is attended with cicatricial contraction, which may cause unsightly deformity. When the cheek is affected, the lower eyelid may be drawn down and everted; when the lips are affected, the mouth may be distorted or seriously diminished in size. When the nose is attacked, both the skin and mucous surfaces are usually involved, and the nasal orifices may be narrowed or even obliterated; sometimes the soft parts, including the cartilages, are destroyed, leaving only the bones covered by tightly stretched scar tissue.

The disease progresses slowly, healing in some places and spreading at others. The patient complains of a burning sensation, but little of pain, and is chiefly concerned about the disfigurement. Nothing is more characteristic of lupus than the appearance of fresh nodules in parts which have already healed. In the course of years large tracts of the face and neck may become affected. From the lips it may spread to the gum and palate, giving to the mucous membrane the appearance of a raised, bright-red, papillary or villous surface. When the disease affects the gums, the teeth may become loose and fall out.

[Illustration: FIG. 96.--Tuberculous Elephantiasis in a woman aet. 35.]

On parts of the body other than the face, the disease is even more chronic, and is often attended with a considerable production of dense fibrous tissue--the so-called *fibroid lupus*. Sometimes there is a warty thickening of the epidermis--*lupus verrucosus*. In the fingers and toes it may lead to a progressive destruction of tissue like that observed in leprosy, and from the resulting loss of portions of the digits it has been called *lupus mutilans*. In the lower extremity a remarkable form of the disease is sometimes met with, to which the term *lupus elephantiasis* (Fig. 96) has been applied. It commences as an ordinary lupus of the toes or dorsum of the foot, from which the tuberculous infection spreads to the lymph vessels, and the limb as a whole becomes enormously swollen and unshapely.

Finally, a long-standing lupus, especially on the cheek, may become the seat of epithelioma--*lupus epithelioma*--usually of the exuberant or cauliflower type, which, like other epitheliomas that originate in scar tissue, presents little tendency to infect the lymphatics.

The *diagnosis* of lupus is founded on the chronic progress and long duration, and the central scarring with peripheral extension of the disease. On the face it is most liable to be confused with syphilis and with rodent cancer. The syphilitic lesion belongs to the tertiary period, and although presenting a superficial resemblance to tuberculosis, its progress is more rapid, so that within a few months it may involve an area of skin as wide as would be affected by lupus in as many years. Further, it readily yields to anti-syphilitic treatment. In cases of tertiary syphilis in which the nose is destroyed, it will be noticed that the bones have suffered most, while in lupus the destruction of tissue involves chiefly the soft parts.

Rodent cancer is liable to be mistaken for lupus, because it affects the same parts of the face; it is equally chronic, and may partly heal. It begins later in life, however, the margin of the ulcer is more sharply defined, and often presents a "rolled" appearance.

Treatment.--When the disease is confined to a limited area, the most rapid and certain cure is obtained by *excision*; larger areas are scraped with the sharp spoon. The *ray treatment* includes the use of luminous, Rontgen, or radium rays, and possesses the advantage of being comparatively painless and of being followed by the least amount of

scarring and deformity.

Encouraging results have also been obtained by the application of carbon dioxide snow.

#Multiple subcutaneous tuberculous nodules# are met with chiefly in children. They are indolent and painless, and rarely attract attention until they break down and form abscesses, which are usually about the size of a cherry, and when these burst sinuses or ulcers result. If the overlying skin is still intact, the best treatment is excision. If the abscess has already infected the skin, each focus should be scraped and packed.

#Sporotrichosis# is a mycotic infection due to the sporothrix Shenkii. It presents so many features resembling syphilis and tubercle that it is frequently mistaken for one or other of these affections. It occurs chiefly in males between fifteen and forty-five, who are farmers, fruit and vegetable dealers, or florists. There is usually a history of trauma of the nature of a scratch or a cut, and after a long incubation period there develop a series of small, hard, round nodules in the skin and subcutaneous tissue which, without pain or temperature, soften into cold abscesses and leave indolent ulcers or sinuses. The infection is of slow progress and follows the course of the lymphatics. From the gelatinous pus the organism is cultivated without difficulty, and this is the essential step in arriving at a diagnosis. The disease yields in a few weeks to full doses of iodide of potassium.

#Elephantiasis.#--This term is applied to an excessive enlargement of a part depending upon an overgrowth of the skin and subcutaneous cellular tissue, and it may result from a number of causes, acting independently or in combination. The condition is observed chiefly in the extremities and in the external organs of generation.

Elephantiasis from Lymphatic or Venous Obstruction.--Of this the best-known example is tropical elephantiasis (*E. arabum*), which is endemic in Samoa, Barbadoes, and other places. It attacks the lower extremity or the genitals in either sex (Figs. 97, 98). The disease is usually ushered in with fever, and signs of lymphangitis in the part affected. After a number of such attacks, the lymph vessels appear to become obliterated, and the skin and subcutaneous cellular tissue, being bathed in stagnant lymph--which possibly contains the products of streptococci--take on an overgrowth, which continues until the part assumes gigantic proportions. In certain cases the lymph trunks have been found to be blocked with the parent worms of the filaria Bancrofti. Cases of elephantiasis of the lower extremity are met with in this country in which there are no filarial parasites in the lymph vessels, and these present features closely resembling the tropical variety, and usually follow upon repeated attacks of lymphangitis or erysipelas.

The part affected is enormously increased in size, and causes inconvenience from its bulk and weight. In contrast to ordinary dropsy, there is no pitting on pressure, and the swelling does not disappear on elevation of the limb. The skin becomes rough and warty, and may hang down in pendulous folds. Blisters form on the surface and yield an abundant exudate of clear lymph. From neglect of cleanliness, the skin becomes the seat of eczema or even of ulceration attended with foul discharge.

Samson Handley has sought to replace the blocked lymph vessels by burying in the subcutaneous tissue of the swollen part a number of stout silk threads--lymphangioplasty. By their capillary action they drain the lymph to a healthy region above, and thus enable it to enter the circulation. It has been more successful in the face and upper limb than in the lower extremity. If the tissues are infected with pus organisms, a course of vaccines should precede the operation.

[Illustration: FIG. 97.--Elephantiasis in a woman aet. 45.]

A similar type of elephantiasis may occur after extirpation of the lymph glands in the axilla or groin; in the leg in long-standing standing

varix and phlebitis with chronic ulcer; in the arm as a result of extensive cancerous disease of the lymphatics in the axilla secondarily to cancer of the breast; and in extensive tuberculous disease of the lymphatics. The last-named is chiefly observed in the lower limb in young adult women, and from its following upon lupus of the toes or foot it has been called lupus elephantiasis. The tuberculous infection spreads slowly up the limb by way of the lymph vessels, and as these are obliterated the skin and cellular tissues become hypertrophied, and the surface is studded over with fungating tuberculous masses of a livid blue colour. As the more severe forms of the disease may prove dangerous to life by pyogenic complications inducing gangrene of the limb, the question of amputation may have to be considered.

[Illustration: FIG. 98.--Elephantiasis of Penis and Scrotum in native of Demerara.

(Mr. Annandale's case.)]

Belonging to this group also is a form of congenital elephantiasis resulting from the circular constriction of a limb in utero by amniotic bands.

Elephantiasis occurring apart from lymphatic or venous obstruction is illustrated by elephantiasis nervorum, in which there is an overgrowth of the skin and cellular tissue of an extremity in association with neuro-fibromatosis of the cutaneous nerves (Fig. 89); and by elephantiasis Graecorum--a form of leprosy in which the skin of the face becomes the seat of tumour-like masses consisting of leprous nodules. It is also illustrated by elephantiasis involving the scrotum as a result of prolonged irritation by the urine in cases in which the penis has been amputated and the urine has infiltrated the scrotal tissues over a period of years.

#Sebaceous Cysts.##Atheromatous cysts or wens are formed in relation to the sebaceous glands and hair follicles. They are commonly met with in adults, on the scalp (Fig. 99), face, neck, back, and external genitals. Sometimes they are multiple, and they may be met with in several members of the same family. They are smooth, rounded, or discoid cysts, varying in size from a split-pea to a Tangerine orange. In consistence they are firm and elastic, or fluctuating, and are incorporated with the overlying skin, but movable on the deeper structures. The orifice of the partly blocked sebaceous follicle is sometimes visible, and the contents of the cyst can be squeezed through the opening. The wall of the cyst is composed of a connective-tissue capsule lined by stratified squamous epithelium. The contents consist of accumulated epithelial cells, and are at first dry and pearly white in appearance, but as a result of fatty degeneration they break down into a greyish-yellow pultaceous and semi-fluid material having a peculiar stale odour. It is probable that the decomposition of the contents is the result of the presence of bacteria, and that from the surgical point of view they should be regarded as infective. A sebaceous cyst may remain indefinitely without change, or may slowly increase in size, the skin over it becoming stretched and closely adherent to the cyst wall as a result of friction and pressure. The contents may ooze from the orifice of the duct and dry on the skin surface, leading to the formation of a sebaceous horn (Fig. 100). As a result of injury the cyst may undergo sudden enlargement from haemorrhage into its interior.

Recurrent attacks of inflammation frequently occur, especially in wens of the face and scalp. Suppuration may ensue and be followed by cure of the cyst, or an offensive fungating ulcer forms which may be mistaken for epithelioma. True cancerous transformation is rare.

Wens are to be diagnosed from dermoids, from fatty tumours, and from cold abscesses. Dermoids usually appear before adult life, and as they nearly always lie beneath the fascia, the skin is movable over them. A fatty tumour is movable, and is often lobulated. The confusion with a cold abscess is most likely to occur in wens of the neck or back, and it may be impossible without the use of an exploring needle to differentiate between them.

[Illustration: FIG. 99.--Multiple Sebaceous Cysts or Wens; the larger ones are of many years' duration.]

Treatment.--The removal of wens is to be recommended while they are small and freely movable, as they are then easily shelled out after incising the overlying skin; sometimes splitting the cyst makes its removal easier. Local anaesthesia is to be preferred. It is important that none of the cyst wall be left behind. In large and adherent wens an ellipse of skin is removed along with the cyst. When inflamed, it may be impossible to dissect out the cyst, and the wall should be destroyed with carbolic acid, the resulting wound being treated by the open method.

#Moles.#--The term mole is applied to a pigmented, and usually hairy, patch of skin, present at or appearing shortly after birth. The colour varies from brown to black, according to the amount of melanin pigment present. The lesion consists in an overgrowth of epidermis which often presents an alveolar arrangement. Moles vary greatly in size: some are mere dots, others are as large as the palm of the hand, and occasionally a mole covers half the face. In addition to being unsightly, they bleed freely when abraded, are liable to ulcerate from friction and pressure, and occasionally become the starting-point of melanotic cancer. Rodent cancer sometimes originates in the slightly pigmented moles met with on the face. Overgrowths in relation to the cutaneous nerves, especially the plexiform neuroma, occasionally originate in pigmented moles. Soldau believes that the pigmentation and overgrowth of the epidermis in moles are associated with, and probably result from, a fibromatosis of the cutaneous nerves.

Treatment.--The quickest way to get rid of a mole is to excise it; if the edges of the gap cannot be brought together with sutures, recourse should be had to grafting. In large hairy moles of the face whose size forbids excision, radium or the X-rays should be employed. Excellent results have been obtained by refrigeration with solid carbon dioxide. In children and women with delicate skin, applications of from ten to thirty seconds suffice. In persons with coarse skin an application of one minute may be necessary, and it may have to be repeated.

#Horns.#--The sebaceous horn results from the accumulation of the dried contents of a wen on the surface of the skin: the sebaceous material after drying up becomes cornified, and as fresh material is added to the base the horn increases in length (Fig. 100). The wart-horn grows from a warty papilloma of the skin. Cicatrix horns are formed by the heaping up of epidermis in the scars that result from burns. Nail-horns are overgrown nails (keratomata of the nail bed), and are met with chiefly in the great toe of elderly bedridden patients. If an ulcer forms at the base of a horn, it may prove the starting-point of epithelioma, and for this reason, as well as for others, horns should be removed.

[Illustration: FIG. 100.--Sebaceous Horn growing from Auricle.

(Dr. Kenneth MacLachan's case.)]

#New Growths in the Skin and Subcutaneous Tissue.#--The Angioma has been described with diseases of blood vessels. Fibroma.--Various types of fibroma occur in the skin. A soft pedunculated fibroma, about the size of a pea, is commonly met with, especially on the neck and trunk; it is usually solitary, and is easily removed with scissors. The multiple, soft fibroma known as molluscum fibrosum, which depends upon a neuro-fibromatosis of the cutaneous nerves, is described with the tumours of nerves. Hard fibromas occurring singly or in groups may be met with, especially in the skin of the buttock, and may present a local malignancy, recurring after removal like the "recurrent fibroid" of Paget. The "painful subcutaneous nodule" is a solitary fibroma related to one of the cutaneous nerves. The hard fibroma known as keloid is described with the affections of scars.

#Papilloma.#--The common wart or verruca is an outgrowth of the

surface epidermis. It may be sessile or pedunculated hard or soft. The surface may be smooth, or fissured and foliated like a cauliflower, or it may be divided up into a number of spines. Warts are met with chiefly on the hands, and are often multiple, occurring in clusters or in successive crops. Multiple warts appear to result from some contagion, the nature of which is unknown; they sometimes occur in an epidemic form among school-children, and show a remarkable tendency to disappear spontaneously. The solitary flat-topped wart which occurs on the face of old people may, if irritated, become the seat of epithelioma. A warty growth of the epidermis is a frequent accompaniment of moles and of that variety of lupus known as _lupus verrucosus_.

Treatment.--In the multiple warts of children the health should be braced up by a change to the seaside. A dusting-powder, consisting of boracic acid with 5 per cent. salicylic acid, may be rubbed into the hands after washing and drying. The persistent warts of young adults should be excised after freezing with chloride of ethyl. When cutting is objected to, they may be painted night and morning with salicylic collodion, the epidermis being dehydrated with alcohol before each application.

Venereal warts occur on the genitals of either sex, and may form large cauliflower-like masses on the inner surface of the prepuce or of the labia majora. Although frequently co-existing with gonorrhoea or syphilis, they occur independently of these diseases, being probably acquired by contact with another individual suffering from warts (C. W. Cathcart). They give rise to considerable irritation and suffering, and when cleanliness is neglected there may be an offensive discharge.

In the female, the cauliflower-like masses are dissected from the labia; in the male, the prepuce is removed and the warts on the glans are snipped off with scissors. In milder cases, the warts usually disappear if the parts are kept absolutely dry and clean. A useful dusting-powder is one consisting of calamine and 5 per cent. salicylic acid; the exsiccated sulphate of iron, in the form of a powder, may be employed in cases which resist this treatment.

#Adenoma.--This is a comparatively rare tumour growing from the glands of the skin. One variety, known as the "tomato tumour," which apparently originates from _the sweat glands_, is met with on the scalp and face in women past middle life. These growths are often multiple; the individual tumours vary in size, and the skin, which is almost devoid of hairs, is glistening and tightly stretched over them. A similar tumour may occur on the nose. The _sebaceous adenoma_, which originates from the sebaceous glands, forms a projecting tumour on the face or scalp, and when the skin is irritated it may ulcerate and fungate. The treatment consists in the removal of the tumour along with the overlying skin.

The exuberant masses on the nose known as "rhinophyma," "lipoma nasi," or "potato nose" are of the nature of sebaceous adenoma, and are removed by shaving them off with a knife until the normal shape of the nose is restored. Healing takes place with remarkable rapidity.

#Cancer.--There are several types of primary cancer of the skin, the most important being squamous epithelioma, rodent cancer, and melanotic cancer.

[Illustration: FIG. 101.--Paraffin Epithelioma.]

#Epithelioma# occurs in a variety of forms. When originating in a small ulcer or wart-for example on the face in old people--it presents the features of a chronic indurated ulcer. A more exuberant and rapidly growing form of epithelial cancer, described by Hutchinson as the _crateriform ulcer_, commences on the face as a small red pimple which rapidly develops into an elevated mass shaped like a bee-hive, and breaks down in the centre. Epithelioma may develop anywhere on the body in relation to long-standing ulcers, especially that resulting from a burn or from lupus; this form usually presents an exuberant outgrowth of epidermis not unlike a cauliflower. An interesting example of

epithelioma has been described by Neve of Kashmir. The natives in that province are in the habit of carrying a fire-basket suspended from the waist, which often burns the skin and causes a chronic ulcer, and many of these ulcers become the seat of epithelioma, due, in Neve's opinion, to the actual contact of the sooty pan with the skin.

The term trade epithelioma has been applied to that form met with in those who follow certain occupations, such as paraffin workers and chimney-sweeps. The most recent member of this group is the X-ray carcinoma, which is met with in those who are constantly exposed to the irritation of the X-rays; there is first a chronic dermatitis with warty overgrowth of the surface epithelium, pigmentation, and the formation of fissures and warts. The trade epithelioma varies a good deal in malignancy, but it tends to cause death in the same manner as other epitheliomas.

Epithelial cancer has also been observed in those who have taken arsenic over long periods for medicinal purposes.

[Illustration: FIG. 102.--Rodent Cancer of Inner Canthus.]

#Rodent Cancer# (Rodent Ulcer).--This is a cancer originating in the sweat glands or sebaceous follicles, or in the foetal residues of cutaneous glands. The cells are small and closely packed together in alveoli or in reticulated columns; cell nests are rare. It is remarkably constant in its seat of origin, being nearly always located on the lateral aspect of the nose or in the vicinity of the lower eyelid (Fig. 102). It is rare on the trunk or limbs. It commences as a small flattened nodule in the skin, the epidermis over it being stretched and shining. The centre becomes depressed, while the margins extend in the form of an elevated ridge. Sooner or later the epidermis gives way in the centre, exposing a smooth raw surface devoid of granulations.

[Illustration: FIG. 103.--Rodent Cancer of fifteen years' duration, which has destroyed the contents of the Orbit.

(Sir Montagu Cotterill's case)]

The margin, while in parts irregular, is typically represented by a well-defined "rolled" border which consists of the peripheral portion of the cancer that has not broken down. The central ulcer may temporarily heal. There is itching but little pain, and the condition progresses extremely slowly; rodent cancers which have existed for many years are frequently met with. The disease attacks and destroys every structure with which it comes in contact, such as the eyelids, the walls of the nasal cavities, and the bones of the face; hence it may produce the most hideous deformities (Fig. 103). The patient may succumb to haemorrhage or to infective complications such as erysipelas or meningitis.

Secondary growths in the lymph glands, while not unknown, are extremely rare. We have only seen them once--in a case of rodent cancer in the groin.

Diagnosis.--Lupus is the disease most often mistaken for rodent cancer. Lupus usually begins earlier in life, it presents apple-jelly nodules, and lacks the rounded, elevated border. Syphilitic lesions progress more rapidly, and also lack the characteristic margin. The differentiation from squamous epithelioma is of considerable importance, as the latter affection spreads more rapidly, involves the lymph glands early, and is much more dangerous to life.

Treatment.--In rodent cancers of limited size--say less than one inch in diameter--free excision is the most rapid and certain method of treatment. The alternative is the application of radium or of the Rontgen rays, which, although requiring many exposures, results in cure with the minimum of disfigurement. If the cancer already covers an extensive area, or has invaded the cavity of the orbit or nose, radium or X-rays yield the best results. The effect is soon shown by the ingrowth of healthy epithelium from the surrounding skin, and at the same time the discharge is lessened. Good results are also reported from

the application of carbon dioxide snow, especially when this follows upon a course of X-ray treatment.

#Paget's disease# of the nipple is an epithelioma occurring in women over forty years of age: a similar form of epithelioma is sometimes met with at the umbilicus or on the genitals.

#Melanotic Cancer.#--Under this head are included all new growths which contain an excess of melanin pigment. Many of these were formerly described as melanotic sarcoma. They nearly always originate in a pigmented mole which has been subjected to irritation. The primary growth may remain so small that its presence is not even suspected, or it may increase in size, ulcerate, and fungate. The amount of pigment varies: when small in amount the growth is brown, when abundant it is a deep black. The most remarkable feature is the rapidity with which the disease becomes disseminated along the lymphatics, the first evidence of which is an enlargement of the lymph glands. As the primary growth is often situated on the sole of the foot or in the matrix of the nail of the great toe, the femoral and inguinal glands become enlarged in succession, forming tumours much larger than the primary growth. Sometimes the dissemination involves the lymph vessels of the limb, forming a series of indurated pigmented cords and nodules (Fig. 104). Lastly, the dissemination may be universal throughout the body, and this usually occurs at a comparatively early stage. The secondary growths are deeply pigmented, being usually of a coal-black colour, and melanin pigment may be present in the urine. When recurrence takes place in or near the scar left by the operation, the cancer nodules are not necessarily pigmented.

[Illustration: FIG. 104.--Diffuse Melanotic Cancer of Lymphatics of Skin secondary to a Growth in the Sole of the Foot.]

To extirpate the disease it is necessary to excise the tumour, with a zone of healthy skin around it and a somewhat large zone of the underlying subcutaneous tissue and deep fascia. Hogarth Pringle recommends that a broad strip of subcutaneous fascia up to and including the nearest anatomical group of glands should be removed with the tumour in one continuous piece.

#Secondary Cancer of the Skin.#--Cancer may spread to the skin from a subjacent growth by direct continuity or by way of the lymphatics. Both of these processes are so well illustrated in cases of mammary cancer that they will be described in relation to that disease.

#Sarcoma# of various types is met with in the skin. The fibroma, after excision, may recur as a fibro-sarcoma. The alveolar sarcoma commences as a hard lump and increases in size until the epidermis gives way and an ulcer is formed.

[Illustration: FIG. 105.--Melanotic Cancer of Forehead with Metastases in Lymph Vessels and Glands.]

(Mr. D. P. D. Wilkie's case.)]

A number of fresh tumours may spring up around the original growth. Sometimes the primary growth appears in the form of multiple nodules which tend to become confluent. Excision, unless performed early, is of little avail, and in any case should be followed up by exposure to radium.

AFFECTIONS OF CICATRICES

A cicatrix or scar consists of closely packed bundles of white fibres covered by epidermis; the skin glands and hair follicles are usually absent. The size, shape, and level of the cicatrix depend upon the conditions which preceded healing.

A healthy scar, when recently formed, has a smooth, glossy surface of a pinkish colour, which tends to become whiter as a result of obliteration

of the blood vessels concerned in its formation.

Weak Scars.--A scar is said to be weak when it readily breaks down as a result of irritation or pressure. The scars resulting from severe burns and those over amputation stumps are especially liable to break down from trivial causes. The treatment is to excise the weak portion of the scar and bring the edges of the gap together.

Contracted scars frequently cause deformity either by displacing parts, such as the eyelid or lip, or by fixing parts and preventing the normal movements--for example, a scar on the flexor aspect of a joint may prevent extension of the forearm (Fig. 63). These are treated by dividing the scar, correcting the deformity, and filling up the gap with epithelial grafts, or with a flap of the whole thickness of the skin. When deformity results from depression of a scar, as is not uncommon after the healing of a sinus, the treatment is to excise the scar. Depressed scars may be raised by the injection of paraffin into the subcutaneous tissue.

Painful Scars.--Pain in relation to a scar is usually due to nerve fibres being compressed or stretched in the cicatricial tissue; and in some cases to ascending neuritis. The treatment consists in excising the scar or in stretching or excising a portion of the nerve affected.

Pigmented or Discoloured Scars.--The best-known examples are the blue coloration which results from coal-dust or gunpowder, the brown scars resulting from chronic ulcer with venous congestion of the leg, and the variously coloured scars caused by tattooing. The only satisfactory method of getting rid of the coloration is to excise the scar; the edges are brought together by sutures, or the raw surface is covered with skin-grafts according to the size of the gap.

Hypertrophied Scars.--Scars occasionally broaden out and become prominent, and on exposed parts this may prove a source of disappointment after operations such as those for goitre or tuberculous glands in the neck. There is sometimes considerable improvement from exposure to the X-rays.

Keloid.--This term is applied to an overgrowth of scar tissue which extends beyond the area of the original wound, and the name is derived from the fact that this extension occurs in the form of radiating processes, suggesting the claws of a crab. It is essentially a fibroma or new growth of fibrous tissue, which commences in relation to the walls of the smaller blood vessels; the bundles of fibrous tissue are for the most part parallel with the surface, and the epidermis is tightly stretched over them. It is more frequent in the negro and in those who are, or have been, the subjects of tuberculous disease.

[Illustration: FIG. 106.--Recurrent Keloid in scar left by operation for tuberculous glands in a girl aet. 7.]

Keloid may attack scars of any kind, such as those resulting from leech-bites, acne pustules, boils or blisters; those resulting from operation or accidental wounds; and the scars resulting from burns, especially when situated over the sternum, appear to be specially liable. The scar becomes more and more conspicuous, is elevated above the surface, of a pinkish or brownish-pink pink colour, and sends out irregular prolongations around its margins. The patient may complain of itching and burning, and of great sensitiveness of the scar, even to contact with the clothing.

There is a natural hesitation to excise keloid because of the fear of its returning in the new scar. The application of radium is, so far as we know, the only means of preventing such return. The irritation associated with keloid may be relieved by the application of salicylic collodion or of salicylic and creosote plaster.

Epithelioma is liable to attack scars in old people, especially those which result from burns sustained early in childhood and have never really healed. From the absence of lymphatics in scar tissue, the

disease does not spread to the glands until it has invaded the tissues outside the scar; the prognosis is therefore better than in epithelioma in general. It should be excised widely; in the lower extremity when there is also extensive destruction of tissue from an antecedent chronic ulcer or osteomyelitis, it may be better to amputate the limb.

AFFECTION OF THE NAILS

Injuries.--When a nail is contused or crushed, blood is extravasated beneath it, and the nail is usually shed, a new one growing in its place. A splinter driven underneath the nail causes great pain, and if organisms are carried in along with it, may give rise to infective complications. The free edge of the nail should be clipped away to allow of the removal of the foreign body and the necessary disinfection.

Trophic Changes.--The growth of the nails may be interfered with in any disturbance of the general health. In nerve lesions, such as a divided nerve-trunk, the nails are apt to suffer, becoming curved, brittle, or furrowed, or they may be shed.

Onychia is the term applied to an infection of the soft parts around the nail or of the matrix beneath it. The commonest form of onychia has already been referred to with whitlow. There is a superficial variety resulting from the extension of a purulent blister beneath the nail lifting it up from its bed, the pus being visible through the nail. The nail as well as the raised horny layer of the epidermis should be removed. A deeper and more troublesome onychia results from infection at the nail-fold; the infection spreads slowly beneath the fold until it reaches the matrix, and a drop or two of pus forms beneath the nail, usually in the region of the lunule. This affection entails a disability of the finger which may last for weeks unless it is properly treated. Treatment by hyperaemia, using a suction bell, should first be tried, and, failing improvement, the nail-fold and lunule should be frozen, and a considerable portion removed with the knife; if only a small portion of the nail is removed, the opening is blocked by granulations springing from the matrix. A new nail is formed, but it is liable to be misshapen.

Tuberculous onychia is met with in children and adolescents. It appears as a livid or red swelling at the root of the nail and spreading around its margins. The epidermis, which is thin and shiny, gives way, and the nail is usually shed.

[Illustration: FIG. 107.--Subungual Exostosis growing from Distal Phalanx of Great Toe, showing Ulceration of Skin and Displacement of Nail.]

Syphilitic affections of the nails assume various aspects. A primary chancre at the edge of the nail may be mistaken for a whitlow, especially if it is attended with much pain. Other forms of onychia occur during secondary syphilis simultaneously with the skin eruptions, and may prove obstinate and lead to shedding of the nails. They also occur in inherited syphilis. In addition to general treatment, an ointment containing 5 per cent. of oleate of mercury should be applied locally.

Ingrowing Toe-nail.--This is more accurately described as an overgrowth of the soft tissues along the edge of the nail. It is most frequently met with in the great toe in young adults with flat-foot whose feet perspire freely, who wear ill-fitting shoes, and who cut their toe-nails carelessly or tear them with their fingers. Where the soft tissues are pressed against the edge of the nail, the skin gives way and there is the formation of exuberant granulations and of discharge which is sometimes foetid. The affection is a painful one and may unfit the patient for work. In mild cases the condition may be remedied by getting rid of contributing causes and by disinfecting the skin and nail; the nail is cut evenly, and the groove between it and the

skin packed with an antiseptic dusting-powder, such as boracic acid. In more severe cases it may be necessary to remove an ellipse of tissue consisting of the edge of the nail, together with the subjacent matrix and the redundant nail-fold.

Subungual exostosis is an osteoma growing from the terminal phalanx of the great toe (Fig. 107). It raises the nail and may be accompanied by ulceration of the skin over the most prominent part of the growth. The soft parts, including the nail, should be reflected towards the dorsum in the form of a flap, the base of the exostosis divided with the chisel, and the exostosis removed.

Malignant disease in relation to the nails is rare. Squamous epithelioma and melanotic cancer are the forms met with. Treatment consists in amputating the digit concerned, and in removing the associated lymph glands.

CHAPTER XVIII

THE MUSCLES, TENDONS, AND TENDON SHEATHS

INJURIES: Contusion; Sprain; Rupture--Hernia of muscle--Dislocation of tendons--Wounds--Avulsion of tendon.
DISEASES OF MUSCLE AND OF TENDONS: Atrophy; "Muscular rheumatism"--Fibrositis; Contracture; Myositis; Calcification and Ossification; Tumours. DISEASES OF TENDON SHEATHS: Teno-synovitis.

INJURIES

#Contusion of Muscle.--Contusion of muscle, which consists in bruising of its fibres and blood vessels, may be due to violence acting from without, as in a blow, a kick, or a fall; or from within, as by the displacement of bone in a fracture or dislocation.

The symptoms are those common to all contusions, and the patient complains of severe pain on attempting to use the muscle, and maintains an attitude which relaxes it. If the sheath of the muscle also is torn, there is subcutaneous ecchymosis, and the accumulation of blood may result in the formation of a haematoma.

Restoration of function is usually complete; but when the nerve supplying the muscle is bruised at the same time, as may occur in the deltoid, wasting and loss of function may be persistent. In exceptional cases the process of repair may be attended with the formation of bone in the substance of the muscle, and this may likewise impair its function.

A contused muscle should be placed at rest and supported by cotton wool and a bandage; after an interval, massage and appropriate exercises are employed.

#Sprain and Partial Rupture of Muscle.--This lesion consists in overstressing and partial rupture of the fibres of a muscle or its aponeurosis. It is of common occurrence in athletes and in those who follow laborious occupations. It may follow upon a single or repeated effort--especially in those who are out of training. Familiar examples of muscular sprain are the "labourer's" or "golfer's back," affecting the latissimus dorsi or the sacrospinalis (erector spinae); the "tennis-player's elbow," and the "sculler's sprain," affecting the muscles and ligaments about the elbow; the "angler's elbow," affecting the common origin of the extensors and supinators; the "sprinter's sprain," affecting the flexors of the hip; and the "jumper's and dancer's sprain," affecting the muscles of the calf. The patient complains of pain, often sudden in onset, of tenderness on pressure, and

of inability to carry out the particular movement by which the sprain was produced. The disability varies in different cases, and it may incapacitate the patient from following his occupation or sport for weeks or, if imperfectly treated, even for months.

The treatment consists in resting the muscle from the particular effort concerned in the production of the sprain, in gently exercising it in other directions, in the use of massage, and the induction of hyperaemia by means of heat. In neglected cases, that is, where the muscle has not been exercised, the patient shrinks from using it and the disablement threatens to be permanent; it is sometimes said that adhesions have formed and that these interfere with the recovery of function. The condition may be overcome by graduated movements or by a sudden forcible movement under an anaesthetic. These cases afford a fruitful field for the bone-setter.

#Rupture of Muscle or Tendon.--A muscle or a tendon may be ruptured in its continuity or torn from its attachment to bone. The site of rupture in individual muscles is remarkably constant, and is usually at the junction of the muscular and tendinous portions. When rupture takes place through the belly of a muscle, the ends retract, the amount of retraction depending on the length of the muscle, and the extent of its attachment to adjacent aponeurosis or bone. The biceps in the arm, and the sartorius in the thigh, furnish examples of muscles in which the separation between the ends may be considerable.

The gap in the muscle becomes filled with blood, and this in time is replaced by connective tissue, which forms a bond of union between the ends. When the space is considerable the connecting medium consists of fibrous tissue, but when the ends are in contact it contains a number of newly formed muscle fibres. In the process of repair, one or both ends of the muscle or tendon may become fixed by adhesions to adjacent structures, and if the distal portion of a muscle is deprived of its nerve supply it may undergo degeneration and so have its function impaired.

Rupture of a muscle or tendon is usually the result of a sudden, and often involuntary, movement. As examples may be cited the rupture of the quadriceps extensor in attempting to regain the balance when falling backwards; of the gastrocnemius, plantaris, or tendo-calcaneus in jumping or dancing; of the adductors of the thigh in gripping a horse when it swerves--"rider's sprain"; of the abdominal muscles in vomiting, and of the biceps in sudden movements of the arm. Sometimes the effort is one that would scarcely be thought likely to rupture a muscle, as in the case recorded by Pagenstecher, where a professional athlete, while sitting at table, ruptured his biceps in a sudden effort to catch a falling glass. It would appear that the rupture is brought about not so much by the contraction of the muscle concerned, as by the contraction of the antagonistic muscles taking place before that of the muscle which undergoes rupture is completed. The violent muscular contractions of epilepsy, tetanus, or delirium rarely cause rupture.

The clinical features are usually characteristic. The patient experiences a sudden pain, with the sensation of being struck with a whip, and of something giving way; sometimes a distant snap is heard. The limb becomes powerless. At the seat of rupture there is tenderness and swelling, and there may be ecchymosis. As the swelling subsides, a gap may be felt between the retracted ends, and this becomes wider when the muscle is thrown into contraction. If untreated, a hard, fibrous cord remains at the seat of rupture.

Treatment.--The ends are approximated by placing the limb in an attitude which relaxes the muscle, and the position is maintained by bandages, splints, or special apparatus. When it is impossible thus to approximate the ends satisfactorily, the muscle or tendon is exposed by incision, and the ends brought into accurate contact by catgut sutures. This operation of primary suture yields the most satisfactory results, and is most successful when it is done within five or six days of the accident. Secondary suture after an interval of months is rendered difficult by the retraction of the ends and by their adhesion to

adjacent structures.

The Rupture of the biceps of the arm may involve the long or the short head, or the belly of the muscle. Most interest attaches to rupture of the long tendon of origin. There is pain and tenderness in front of the upper end of the humerus, the patient is unable to abduct or to elevate the arm, and he may be unable to flex the elbow when the forearm is supinated. The long axis of the muscle, instead of being parallel with the humerus, inclines downwards and outwards. When the patient is asked to contract the muscle, its belly is seen to be drawn towards the elbow.

The adductor longus may be ruptured, or torn from the pubes, by a violent effort to adduct the limb. A swelling forms in the upper and medial part of the thigh, which becomes smaller and harder when the muscle is thrown into contraction.

The quadriceps femoris is usually ruptured close to its insertion into the patella, in the attempt to avoid falling backwards. The injury is sometimes bilateral. The injured limb is rendered useless for progression, as it suddenly gives way whenever the knee is flexed. Treatment is conducted on the same lines as in transverse fracture of the patella; in the majority of cases the continuity of the quadriceps should be re-established by suture within five or six days of the accident.

The tendo calcaneus (Achillis) is comparatively easily ruptured, and the symptoms are sometimes so slight that the nature of the injury may be overlooked. The limb should be put up with the knee flexed and the toes pointed. This may be effected by attaching one end of an elastic band to the heel of a slipper, and securing the other to the lower third of the thigh. If this is not sufficient to bring the ends into apposition they should be approximated by an open operation.

The plantaris is not infrequently ruptured from trivial causes, such as a sudden movement in boxing, tennis, or hockey. A sharp stinging pain like the stroke of a whip is felt in the calf; there is marked tenderness at the seat of rupture, and the patient is unable to raise the heel without pain. The injury is of little importance, and if the patient does not raise the heel from the ground in walking, it is recovered from in a couple of weeks or so, without it being necessary to lay him up.

#Hernia of Muscle.---This is a rare condition, in which, owing to the fascia covering a muscle becoming stretched or torn, the muscular substance is protruded through the rent. It has been observed chiefly in the adductor longus. An oval swelling forms in the upper part of the thigh, is soft and prominent when the muscle is relaxed, less prominent when it is passively extended, and disappears when the muscle is thrown into contraction. It is liable to be mistaken, according to its situation, for a tumour, a cyst, a pouched vein, or a femoral or obturator hernia. Treatment is only called for when it is causing inconvenience, the muscle being exposed by a suitable incision, the herniated portion excised, and the rent in the sheath closed by sutures.

#Dislocation of Tendons.---Tendons which run in grooves may be displaced as a result of rupture of the confining sheath. This injury is met with chiefly in the tendons at the ankle and in the long tendon of the biceps.

Dislocation of the peronei tendons may occur, for example, from a violent twist of the foot. There is severe pain and considerable swelling on the lateral aspect of the ankle; the peroneus longus by itself, or together with the brevis, can be felt on the lateral aspect or in front of the lateral malleolus; the patient is unable to move the foot. By a little manipulation the tendons are replaced in their grooves, and are retained there by a series of strips of plaster. At the end of three weeks massage and exercises are employed.

In other cases there is no history of injury, but whenever the foot is

everted the tendon of the peroneus longus is liable to be jerked forwards out of its groove, sometimes with an audible snap. The patient suffers pain and is disabled until the tendon is replaced. Reduction is easy, but as the displacement tends to recur, an operation is required to fix the tendon in its place. An incision is made over the tendon; if the sheath is slack or torn, it is tightened up or closed with catgut sutures; or an artificial sheath is made by raising up a quadrilateral flap of periosteum from the lateral aspect of the fibula, and stitching it over the tendon.

Similarly the tibialis posterior may be displaced over the medial malleolus as a result of inversion of the foot.

The long tendon of the biceps may be dislocated laterally--or more frequently medially--as a result of violent or repeated rotation movements of the arm, such as are performed in wringing clothes. The patient is aware of the displacement taking place, and is unable to extend the forearm until the displaced tendon has been reduced by abducting the arm. In recurrent cases the patient may be able to dislocate the tendon at will, but the disability is so inconsiderable that there is rarely any occasion for interference.

#Wounds of Muscles and Tendons.#--When a muscle is cut across in a wound, its ends should be brought together with sutures. If the ends are allowed to retract, and especially if the wound suppurates, they become united by scar tissue and fixed to bone or other adjacent structure. In a limb this interferes with the functions of the muscle; in the abdominal wall the scar tissue may stretch, and so favour the development of a ventral hernia.

Tendons may be cut across accidentally, especially in those wounds so commonly met with above the wrist as a result, for example, of the hand being thrust through a pane of glass. It is essential that the ends should be sutured to each other, and as the proximal end is retracted the original wound may require to be enlarged in an upward direction. When primary suture has been omitted, or has failed in consequence of suppuration, the separated ends of the tendon become adherent to adjacent structures, and the function of the associated muscle is impaired or lost. Under these conditions the operation of secondary suture is indicated.

A free incision is necessary to discover and isolate the ends of the tendon; if the interval is too wide to admit of their being approximated by sutures, means must be taken to lengthen the tendon, or one from some other part may be inserted in the gap. A new sheath may be provided for the tendon by resecting a portion of the great saphenous vein.

Injuries of the tendons of the fingers are comparatively common. One of the best known is the partial or complete rupture of the aponeurosis of the extensor tendon close to its insertion into the terminal phalanx--drop- or mallet-finger. This may result from comparatively slight violence, such as striking the tip of the extended finger against an object, or the violence may be more severe, as in attempting to catch a cricket ball or in falling. The terminal phalanx is flexed towards the palm and the patient is unable to extend it. The treatment consists in putting up the finger with the middle joint strongly flexed. In neglected cases, a perfect functional result can only be obtained by operation; under a local anaesthetic, the ruptured tendon is exposed and is sutured to the base of the phalanx, which may be drilled for the passage of the sutures.

Subcutaneous rupture of one or other of the digital tendons in the hand or at the wrist can be remedied only by operation. When some time has elapsed since the accident, the proximal end may be so retracted that it cannot be brought down into contact with the distal end, in which case a slip may be taken from an adjacent tendon; in the case of one of the extensors of the thumb, the extensor carpi radialis longus may be detached from its insertion and stitched to the distal end of the tendon of the thumb.

Subcutaneous rupture of the tendon of the extensor pollicis longus at the wrist takes place just after its emergence from beneath the annular ligament; the actual rupture may occur painlessly, more frequently a sharp pain is felt over the back of the wrist. The prominence of the tendon, which normally forms the ulnar border of the snuff-box, disappears. This lesion is chiefly met with in drummer-boys and is the cause of drummer's palsy. The only chance of restoring function is in uniting the ruptured tendon by open operation.

[Illustration: FIG. 108.--Avulsion of Tendon with Terminal Phalanx of Thumb.]

(Surgical Museum, University of Edinburgh.)]

Avulsion of Tendons.--This is a rare injury, in which the tendons of a finger or toe are torn from their attachments along with a portion of the digit concerned. In the hand, it is usually brought about by the fingers being caught in the reins of a runaway horse, or being seized in a horse's teeth, or in machinery. It is usually the terminal phalanx that is separated, and with it the tendon of the deep flexor, which ruptures at its junction with the belly of the muscle (Fig. 108). The treatment consists in disinfecting the wound, closing the tendon-sheath, and trimming the mutilated finger so as to provide a useful stump.

DISEASES OF MUSCLES AND TENDONS

Congenital absence of muscles is sometimes met with, usually in association with other deformities. The pectoralis major, for example, may be absent on one or on both sides, without, however, causing any disability, as other muscles enlarge and take on its functions.

Atrophy of Muscle.--Simple atrophy, in which the muscle elements are merely diminished in size without undergoing any structural alteration, is commonly met with as a result of disuse, as when a patient is confined to bed for a long period.

In cases of joint disease, the muscles acting on the joint become atrophied more rapidly than is accounted for by disuse alone, and this is attributed to an interference with the trophic innervation of the muscles reflected from centres in the spinal medulla. It is more marked in the extensor than in the flexor groups of muscles. Those affected become soft and flaccid, exhibit tremors on attempted movement, and their excitability to the faradic current is diminished.

Neuropathic atrophy is associated with lesions of the nervous system. It is most pronounced in lesions of the motor nerve-trunks, probably because vaso-motor and trophic fibres are involved as well as those that are purely motor in function. It is attended with definite structural alterations, the muscle elements first undergoing fatty degeneration, and then being absorbed, and replaced to a large extent by ordinary connective tissue and fat. At a certain stage the muscles exhibit the reaction of degeneration. In the common form of paralysis resulting from poliomyelitis, many fibres undergo fatty degeneration and are replaced by fat, while at the same time there is a regeneration of muscle fibres.

#Fibrositis# or "#Muscular Rheumatism#."--This clinical term is applied to a group of affections of which lumbago is the best-known example. The group includes lumbago, stiff-neck, and pleurodynia--conditions which have this in common, that sudden and severe pain is excited by movement of the affected part. The lesion consists in inflammatory hyperplasia of the connective tissue; the new tissue differs from normal fibrous tissue in its tendency to contract, in being swollen, painful and tender on pressure, and in the fact that it can be massaged away (Stockman). It would appear to involve mainly the fibrous tissue of muscles, although it may extend from this to aponeuroses, ligaments, periosteum, and the sheaths of nerves. The term fibrositis was applied to it by Gowers in 1904.

In lumbago--lumbo-sacral fibrositis--the pain is usually located

over the sacrum, the sacro-iliac joint, or the aponeurosis of the lumbar muscles on one or both sides. The amount of tenderness varies, and so long as the patient is still he is free from pain. The slightest attempt to alter his position, however, is attended by pain, which may be so severe as to render him helpless for the moment. The pain is most marked on rising from the stooping or sitting posture, and may extend down the back of the hip, especially if, as is commonly the case, lumbago and gluteal fibrosis coexist. Once a patient has suffered from lumbago, it is liable to recur, and an attack may be determined by errors of diet, changes of weather, exposure to cold or unwonted exertion. It is met with chiefly in male adults, and is most apt to occur in those who are gouty or are the subjects of oxaluric dyspepsia.

Gluteal fibrositis usually follows exposure to wet, and affects the gluteal muscles, particularly the medius, and their aponeurotic coverings. When the condition has lasted for some time, indurated strands or nodules can be detected on palpating the relaxed muscles. The patient complains of persistent aching and stiffness over the buttock, and sometimes extending down the lateral aspect of the thigh. The pain is aggravated by such movements as bring the affected muscles into action. It is not referred to the line of the sciatic nerve, nor is there tenderness on pressing over the nerve, or sensations of tingling or numbness in the leg or foot.

If untreated, the morbid process may implicate the sheath of the sciatic nerve and cause genuine sciatic neuralgia (Llewellyn and Jones). A similar condition may implicate the fascia lata of the thigh, or the calf muscles and their aponeuroses--crural fibrositis.

In painful stiff-neck, or "rheumatic torticollis," the pain is located in one side of the neck, and is excited by some inadvertent movement. The head is held stiffly on one side as in wry-neck, the patient contracting the sterno-mastoid. There may be tenderness over the vertebral spines or in the lines of the cervical nerves, and the sterno-mastoid may undergo atrophy. This affection is more often met with in children.

In pleurodynia--intercostal fibrositis--the pain is in the line of the intercostal nerves, and is excited by movement of the chest, as in coughing, or by any bodily exertion. There is often marked tenderness.

A similar affection is met with in the shoulder and arm--brachial fibrositis--especially on waking from sleep. There is acute pain on attempting to abduct the arm, and there may be localised tenderness in the region of the axillary nerve.

Treatment.--The general treatment is concerned with the diet, attention to the stomach, bowels, and kidneys and with the correction of any gouty tendencies that may be present. Remedies such as salicylates are given for the relief of pain, and for this purpose drugs of the aspirin type are to be preferred, and these may be followed by large doses of iodide of potassium. Great benefit is derived from massage, and from the induction of hyperaemia by means of heat. Cupping or needling, or, in exceptional cases, hypodermic injections of antipyrin or morphin, may be called for. To prevent relapses of lumbago, the patient must take systematic exercises of all kinds, especially such as bring out the movements of the vertebral column and hip-joints.

[Illustration: FIG. 109.--Volkmann's Ischaemic Contracture. When the wrist is flexed to a right angle it is possible to extend the fingers.

(Photographs lent by Mr. Lawford Knaggs)]

#Contracture of Muscles.#--Permanent shortening of muscles results from the prolonged approximation of their points of attachment, or from structural changes in their substance produced by injury or by disease. It is a frequent accompaniment and sometimes a cause of deformities, in the treatment of which lengthening of the shortened muscles or their tendons may be an essential step.

#Myositis.#--_Ischaemic Myositis._--Volkmann was the first to describe a form of myositis followed by contracture, resulting from interference with the arterial blood supply. It is most frequently observed in the flexor muscles of the forearm in children and young persons under treatment for fractures in the region of the elbow, the splints and bandages causing compression of the blood vessels. There is considerable effusion of blood, the skin is tense, and the muscles, vessels, and nerves are compressed; this is further increased if the elbow is flexed and splints and tight bandages are applied. The muscles acquire a board-like hardness and no longer contract under the will, and passive motion is painful and restricted. Slight contracture of the fingers is usually the first sign of the malady; in time the muscles undergo further contraction, and this brings about a claw-like deformity of the hand. The affected muscles usually show the reaction of degeneration. In severe cases the median and ulnar nerves are also the seat of cicatricial changes (ischaemic neuritis).

By means of splints, the interphalangeal, metacarpo-phalangeal, and wrist joints should be gradually extended until the deformity is over-corrected (R. Jones). Murphy advises resection of the radius and ulna sufficient to admit of dorsiflexion of the joints and lengthening of the flexor tendons.

Various forms of pyogenic infection are met with in muscle, most frequently in relation to pyaemia and to typhoid fever. These may result in overgrowth of the connective-tissue framework of the muscle and degeneration of its fibres, or in suppuration and the formation of one or more abscesses in the muscle substance. Repair may be associated with contracture.

A gonorrhoeal form of myositis is sometimes met with; it is painful, but rarely goes on to suppuration.

In the early secondary period of syphilis, the muscles may be the seat of dull, aching, nocturnal pains, especially in the neck and back. Syphilitic contracture is a condition which has been observed chiefly in the later secondary period; the biceps of the arm and the hamstrings in the thigh are the muscles more commonly affected. The striking feature is a gradually increasing difficulty of extending the limb at the elbow or knee, and progressive flexion of the joint. The affected muscle is larger and firmer than normal, and its electric excitability is diminished. In tertiary syphilis, individual muscles may become the seat of interstitial myositis or of gummata, and these affections readily yield to anti-syphilitic remedies.

Tuberculous disease in muscle, while usually due to extension from adjacent tissues, is sometimes the result of a primary infection through the blood-stream. Tuberculous nodules are found disseminated throughout the muscle; the surrounding tissues are indurated, and central caseation may take place and lead to abscess formation and sinuses. We have observed this form of tuberculous disease in the gastrocnemius and in the psoas--in the latter muscle apart from tuberculous disease in the vertebrae.

#Tendinitis.#--German authors describe an inflammation of tendon as distinguished from inflammation of its sheath, and give it the name tendinitis. It is met with most frequently in the tendo-calcaneus in gouty and rheumatic subjects who have overstrained the tendon, especially during cold and damp weather. There is localised pain which is aggravated by walking, and the tendon is sensitive and swollen from a little above its insertion to its junction with the muscle. Gouty nodules may form in its substance. Constitutional measures, massage, and douching should be employed, and the tendon should be protected from strain.

#Calcification and Ossification in Muscles, Tendons, and Fasciae.#--_Myositis ossificans._--Ossifications in muscles, tendons, fasciae, and ligaments, in those who are the subjects of arthritis deformans, are seldom recognised clinically, but are frequently met with in dissecting-rooms and museums. Similar localised ossifications are met

with in Charcot's disease of joints, and in fractures which have repaired with exuberant callus. The new bone may be in the form of spicules, plates, or irregular masses, which, when connected with a bone, are called false exostoses (Fig. 110).

[Illustration: FIG. 110.--Ossification in Tendon of Ilio-psoas Muscle.]

Traumatic Ossification in Relation to Muscle.--Various forms of ossification are met with in muscle as the result of a single or of repeated injury. Ossification in the crureus or vastus lateralis muscle has been frequently observed as a result of a kick from a horse. Within a week or two a swelling appears at the site of injury, and becomes progressively harder until its consistence is that of bone. If the mass of new bone moves with the affected muscle, it causes little inconvenience. If, as is commonly the case, it is fixed to the femur, the action of the muscle is impaired, and the patient complains of pain and difficulty in flexing the knee. A skiagram shows the extent of the mass and its relationship to the femur. The treatment consists in excising the bony mass.

Difficulty may arise in differentiating such a mass of bone from sarcoma; the ossification in muscle is uniformly hard, while the sarcoma varies in consistence at different parts, and the X-ray picture shows a clear outline of the bone in the vicinity of the ossification in muscle, whereas in sarcoma the involvement of the bone is shown by indentations and irregularity in its contour.

A similar ossification has been observed in relation to the insertion of the brachialis muscle as a sequel of dislocation of the elbow. After reduction of the dislocation, the range of movement gradually diminishes and a hard swelling appears in front of the lower end of the humerus. The lump continues to increase in size and in three to four weeks the disability becomes complete. A radiogram shows a shadow in the muscle, attached at one part as a rule to the coronoid process. During the next three or four months, the lump in front of the elbow remains stationary in size; a gradual decrease then ensues, but the swelling persists, as a rule, for several years.

[Illustration: FIG. 111.--Calcification and Ossification in Biceps and Triceps.

(From a radiogram lent by Dr. C. A. Adair Dighton.)]

Ossification in the adductor longus was first described by Billroth under the name of "rider's bone." It follows bruising and partial rupture of the muscle, and has been observed chiefly in cavalry soldiers. If it causes inconvenience the bone may be removed by operation.

Ossification in the deltoid and pectoral muscles has been observed in foot-soldiers in the German army, and has received the name of "drill-bone"; it is due to bruising of the muscle by the recoil of the rifle.

Progressive Ossifying Myositis.--This is a rare and interesting disease, in which the muscles, tendons, and fasciae throughout the body become the seat of ossification. It affects almost exclusively the male sex, and usually begins in childhood or youth, sometimes after an injury, sometimes without apparent cause. The muscles of the back, especially the trapezius and latissimus, are the first to be affected, and the initial complaint is limitation of movement.

[Illustration: FIG. 112.--Ossification in Muscles of Trunk in a case of generalised Ossifying Myositis.

(Photograph lent by Dr. Rustomjee.)]

The affected muscles show swellings which are rounded or oval, firm and elastic, sharply defined, without tenderness and without discoloration of the overlying skin. Skiagrams show that a considerable deposit of

lime salts may precede the formation of bone, as is seen in Fig. 111. In course of time the vertebral column becomes rigid, the head is bent forward, the hips are flexed, and abduction and other movements of the arms are limited. The disease progresses by fits and starts, until all the striped muscles of the body are replaced by bone, and all movements, even those of the jaws, are abolished. The subjects of this disease usually succumb to pulmonary tuberculosis.

There is no means of arresting the disease, and surgical treatment is restricted to the removal or division of any mass of bone that interferes with an important movement.

A remarkable feature of this disease is the frequent presence of a deformity of the great toe, which usually takes the form of hallux valgus, the great toe coming to lie beneath the second one; the shortening is usually ascribed to absence of the first phalanx, but it has been shown to depend also on a synostosis and imperfect development of the phalanges. A similar deformity of the thumb is sometimes met with.

Microscopical examination of the muscles shows that, prior to the deposition of lime salts and the formation of bone, there occurs a proliferation of the intra-muscular connective tissue and a gradual replacement and absorption of the muscle fibres. The bone is spongy in character, and its development takes place along similar lines to those observed in ossification from the periosteum.

#Tumours of Muscle.#--With the exception of congenital varieties, such as the rhabdomyoma, tumours of muscle grow from the connective-tissue framework and not from the muscle fibres. Innocent tumours, such as the fibroma, lipoma, angioma, and neuro-fibroma, are rare. Malignant tumours may be primary in the muscle, or may result from extension from adjacent growths--for example, implication of the pectoral muscle in cancer of the breast--or they may be derived from tumours situated elsewhere. The diagnosis of an intra-muscular tumour is made by observing that the swelling is situated beneath the deep fascia, that it becomes firm and fixed when the muscle contracts, and that, when the muscle is relaxed, it becomes softer, and can be moved in the transverse axis of the muscle, but not in its long axis.

Clinical interest attaches to that form of slowly growing fibro-sarcoma--_the recurrent fibroid of Paget--which is most frequently met with in the muscles of the abdominal wall. A rarer variety is the ossifying chondro-sarcoma, which undergoes ossification to such an extent as to be visible in skiagrams.

In primary sarcoma the treatment consists in removing the muscle. In the limbs, the function of the muscle that is removed may be retained by transplanting an adjacent muscle in its place.

Hydatid cysts of muscle resemble those developing in other tissues.

DISEASES OF TENDON SHEATHS

Tendon sheaths have the same structure and function as the synovial membranes of joints, and are liable to the same diseases. Apart from the tendon sheaths displayed in anatomical dissections, there is a loose peritendinous and perimuscular cellular tissue which is subject to the same pathological conditions as the tendon sheaths proper.

#Teno-synovitis.#--The toxic or infective agent is conveyed to the tendon sheaths through the blood-stream, as in the gouty, gonorrhoeal, and tuberculous varieties, or is introduced directly through a wound, as in the common pyogenic form of teno-synovitis.

Teno-synovitis Crepitans.--In the simple or traumatic form of teno-synovitis, although the most prominent etiological factor is a strain or over-use of the tendon, there would appear to be some other, probably a toxic, factor in its production, otherwise the affection

would be much more common than it is: only a small proportion of those who strain or over-use their tendons become the subjects of teno-synovitis. The opposed surfaces of the tendon and its sheath are covered with fibrinous lymph, so that there is friction when they move on one another.

The clinical features are pain on movement, tenderness on pressure over the affected tendon, and a sensation of crepitation or friction when the tendon is moved in its sheath. The crepitation may be soft like the friction of snow, or may resemble the creaking of new leather--"saddle-back creaking." There may be swelling in the long axis of the tendon, and redness and oedema of the skin. If there is an effusion of fluid into the sheath, the swelling is more marked and crepitation is absent. There is little tendency to the formation of adhesions.

In the upper extremity, the sheath of the long tendon of the biceps may be affected, but the condition is most common in the tendons about the wrist, particularly in the extensors of the thumb, and it is most frequently met with in those who follow occupations which involve prolonged use or excessive straining of these tendons--for example, washerwomen or riveters. It also occurs as a result of excessive piano-playing, fencing, or rowing.

At the ankle it affects the peronei, the extensor digitorum longus, or the tibialis anterior. It is most often met with in relation to the tendo-calcaneus--Achillo-dynia--and results from the pressure of ill-fitting boots or from the excessive use and strain of the tendon in cycling, walking, or dancing. There is pain in raising the heel from the ground, and creaking can be felt on palpation.

The treatment consists in putting the affected tendon at rest, and with this object a splint may be helpful; the usual remedies for inflammation are indicated: Bier's hyperaemia, lead and opium fomentations, and ichthylol and glycerine. The affection readily subsides under treatment, but is liable to relapse on a repetition of the exciting cause.

Gouty Teno-synovitis.--A deposit of urate of soda beneath the endothelial covering of tendons or of that lining their sheaths is commonly met with in gouty subjects. The accumulation of urates may result in the formation of visible nodular swellings, varying in size from a pea to a cherry, attached to the tendon and moving with it. They may be merely unsightly, or they may interfere with the use of the tendon. Recurrent attacks of inflammation are prone to occur. We have removed such gouty masses with satisfactory results.

Suppurative Teno-synovitis.--This form usually follows upon infected wounds of the fingers--especially of the thumb or little finger--and is a frequent sequel to whitlow; it may also follow amputation of a finger. Once the infection has gained access to the sheath, it tends to spread, and may reach the palm or even the forearm, being then associated with cellulitis. In moderately acute cases the tendon and its sheath become covered with granulations, which subsequently lead to the formation of adhesions; while in more acute cases the tendon sloughs. The pus may burst into the cellular tissue outside the sheath, and the suppuration is liable to spread to neighbouring sheaths or to adjacent bones or joints--for example, those of the wrist.

The treatment consists in inducing hyperaemia and making small incisions for the escape of pus. The site of incision is determined by the point of greatest tenderness on pressure. After the inflammation has subsided, active and passive movements are employed to prevent the formation of adhesions between the tendon and its sheath. If the tendon sloughs, the dead portion should be cut away, as its separation is extremely slow and is attended with prolonged suppuration.

Gonorrhoeal Teno-synovitis.--This is met with especially in the tendon sheaths about the wrist and ankle. It may occur in a mild form, with pain, impairment of movement, and oedema, and sometimes an elongated,

fluctuating swelling, the result of serous effusion into the sheath. This condition may alternate with a gonorrhoeal affection of one of the larger joints. It may subside under rest and soothing applications, but is liable to relapse. In the more severe variety the skin is red, and the swelling partakes of the characters of a phlegmon with threatening suppuration; it may result in crippling from adhesions. Even if pus forms in the sheath, the tendon rarely sloughs. The treatment consists in inducing hyperaemia by Bier's method; and a vaccine may be employed with satisfactory results.

#Tuberculous Disease of Tendon Sheaths.--This is a comparatively common affection, and is analogous to tuberculous disease of the synovial membrane of joints. It may originate in the sheath, or may spread to it from an adjacent bone.

The commonest form--hydrops--is that in which the synovial sheath is distended with a viscous fluid, and the fibrinous material on the free surface becomes detached and is moulded into melon-seed bodies by the movement of the tendon. The sheath itself is thickened by the growth of tuberculous granulation tissue. The bodies are smooth and of a dull-white colour, and vary greatly in size and shape. There may be an overgrowth of the fatty fringes of the synovial sheath, a condition described as "arborescent lipoma."

The clinical features vary with the tendon sheath affected. In the common flexor sheath of the hand an hour-glass-shaped swelling is formed, bulging above and below the transverse carpal (anterior annular) ligament--formerly known as compound palmar ganglion. There is little or no pain, but the fingers tend to be stiff and weak, and to become flexed. On palpation, it is usually possible to displace the contents of the sheath from one compartment to the other, and this may yield fluctuation, and, what is more characteristic, a peculiar soft crepitant sensation from the movement of the melon-seed bodies. In the sheath of the peronei or other tendons about the ankle, the swelling is sausage-shaped, and is constricted opposite the annular ligament.

The onset and progress of the affection are most insidious, and the condition may remain stationary for long periods. It is aggravated by use or strain of the tendons involved. In exceptional cases the skin is thinned and gives way, resulting in the formation of a sinus.

Treatment.--In the common flexor sheath of the palm, an attempt may be made to cure the condition by removing the contents through a small incision and filling the cavity with iodoform glycerine, followed by the use of Bier's bandage. If this fails, the distended sheath is laid open, the contents removed, the wall scraped, and the wound closed.

A less common form of tuberculous disease is that in which the sheath becomes the seat of a diffuse tuberculous thickening, not unlike the white swelling met with in joints, and with a similar tendency to caseation. A painless swelling of an elastic character forms in relation to the tendon sheath. It is hour-glass-shaped in the common flexor sheath of the palm, elongated or sausage-shaped in the extensors of the wrist and in the tendons at the ankle. The tuberculous granulation tissue is liable to break down and lead to the formation of a cold abscess and sinuses, and in our experience is often associated with disease in an adjacent bone or joint. In the peronei tendons, for example, it may result from disease of the fibula or of the ankle-joint.

When conservative measures fail, excision of the affected sheath should be performed; the whole of the diseased area being exposed by free incision of the overlying soft parts, the sheath is carefully isolated from the surrounding tissues and is cut across above and below. Any tuberculous tissue on the tendon itself is removed with a sharp spoon. Associated bone or joint lesions are dealt with at the same time. In the after-treatment the functions of the tendons must be preserved by voluntary and passive movements.

#Syphilitic Affections of Tendon Sheaths.--These closely resemble the syphilitic affections of the synovial membrane of joints. During the

secondary period the lesion usually consists in effusion into the sheath; gummata are met with during the tertiary period.

Arborescent lipoma has been found in the sheaths of tendons about the wrist and ankle, sometimes in a multiple and symmetrical form, unattended by symptoms and disappearing under anti-syphilitic treatment.

#Tumours of Tendon Sheaths.--Innocent tumours, such as lipoma, fibroma, and myxoma, are rare. Special mention should be made of the myeloma which is met with at the wrist or ankle as an elongated swelling of slow development, or over the phalanx of a finger as a small rounded swelling. The tumour tissue, when exposed by dissection, is of a chocolate or chamois-yellow colour, and consists almost entirely of giant cells. The treatment consists in dissecting the tumour tissue off the tendons, and this is usually successful in bringing about a permanent cure.

All varieties of sarcoma are met with, but their origin from tendon sheaths is not associated with special features.

CHAPTER XIX

THE BURSAE

Anatomy--Normal and adventitious bursae--Injuries: Bursal haematoma--DISEASES: Infective bursitis; Traumatic or trade bursitis; Bursal hydrops; Solid bursal tumour; Gonorrhoeal and suppurative forms of bursitis; Tuberculous and syphilitic disease--Tumours--Diseases of individual bursae in the upper and lower extremities.

A bursa is a closed sac lined by endothelium and containing synovia. Some are normally present--for instance, that between the skin and the patella, and that between the aponeurosis of the gluteus maximus and the great trochanter. Adventitious bursae are developed as a result of abnormal pressure--for example, over the tarsal bones in cases of club-foot.

#Injuries of Bursae.--As a result of contusion, especially in bleeders, haemorrhage may occur into the cavity of a bursa and give rise to a bursal haematoma. Such a haematoma may mask a fracture of the bone beneath--for example, fracture of the olecranon.

#Diseases of Bursae.--The lining membrane of bursae resembles that of joints and tendon sheaths, and is liable to the same forms of disease.

#Infective bursitis# frequently follows abrasions, scratches, and wounds of the skin over the prepatellar or olecranon bursa, and in neglected cases the infection transgresses the wall of the bursa and gives rise to a spreading cellulitis.

#Traumatic or Trade Bursitis.--This term may be conveniently applied to those affections of bursae which result from repeated slight traumatism incident to particular occupations. The most familiar examples of these are the enlargement of the prepatellar bursa met with in housemaids--the "housemaid's knee" (Fig. 113); the enlargement of the olecranon bursa--"miner's elbow"; and of the ischial bursa--"weaver's" or "tailor's bottom" (Fig. 116). These affections are characterised by an effusion of fluid into the sac of the bursa with thickening of its lining membrane. While friction and pressure are the most evident factors in their production, it is probable that there is also some toxic agent concerned, otherwise these affections would be much more common than they are. Of the countless housemaids in whom the prepatellar bursa is subjected to friction and pressure, only a small proportion become the subjects of housemaid's knee.

Clinical Features. --As these are best illustrated in the different varieties of prepatellar bursitis, it is convenient to take this as the type. In a number of cases the inflammation is acute and the patient is unable to use the limb; the part is hot, swollen, and tender, and fluctuation can be detected in the bursa. In the majority the condition is chronic, and the chief feature is the gradual accumulation of fluid constituting the bursal hydrops or hygroma. When the affection has lasted some time, or has frequently relapsed, the wall of the bursa becomes thickened by fibrous tissue, which may be deposited irregularly, so that septa, bands, or fringes are formed, not unlike those met with in arthritis deformans. These fringes may be detached and form loose bodies like those met with in joints; less frequently there are fibrinous bodies of the melon-seed type, sometimes moulded into circular discs like wafers. The presence of irregular thickenings of the wall, or of loose bodies, may be recognised on palpation, especially in superficial bursae, if the sac is not tensely filled with fluid. The thickening of the wall may take place in a uniform and concentric fashion, resulting in the formation of a fibrous tumour--the solid bursal tumour--a small cavity remaining in the centre which serves to distinguish it from a new growth or neoplasm.

[Illustration: FIG. 113.--Hydrops of Prepatellar Bursa in a housemaid.]

The treatment varies according to the variety and stage of the affection. In recent cases the symptoms subside under rest and the application of fomentations. Hydrops may be got rid of by blistering, by tapping, or by incision and drainage. When the wall is thickened, the most satisfactory treatment is to excise the bursa; the overlying skin being reflected in the shape of a horse-shoe flap or being removed along with the bursa.

#Other Diseases of Bursae# are associated with gonorrhoeal infection, and with rheumatism, especially that following scarlet fever, and are apt to be persistent or to relapse after apparent cure. In the gouty form, urate of soda is deposited in the wall of the bursa, and may result in the formation of chalky tumours, sometimes of considerable size (Fig. 114).

[Illustration: FIG. 114.--Section through Bursa over external malleolus, showing deposit of urate of soda. (Cf. Fig. 117.)]

Tuberculous disease of bursae closely resembles that of tendon sheaths. It may occur as an independent affection, or may be associated with disease in an adjacent bone or joint. It is met with chiefly in the prepatellar and subdeltoid bursae, or in one of the bursae over the great trochanter. The clinical features are those of an indolent hydrops, with or without melon-seed bodies, or of uniform thickening of the wall of the bursa; the tuberculous granulation tissue may break down into a cold abscess, and give rise to sinuses. The best treatment is to excise the affected bursa, or, when this is impracticable, to lay it freely open, remove the tuberculous tissue with the sharp spoon or knife, and treat the cavity by the open method.

Syphilitic disease is rarely recognised except in the form of bursal and peri-bursal gummatæ in front of the knee-joint.

New growths include the fibroma, the myxoma, the myeloma or giant-celled tumour, and various forms of sarcoma.

#Diseases of Individual Bursae.#--The olecranon bursa is frequently the seat of pyogenic infection and of traumatic or trade bursitis, the latter being known as "miner's" or "student's elbow."

[Illustration: FIG. 115.--Tuberculous Disease of Sub-deltoid Bursa.

(From a photograph lent by Sir George T. Beatson.)]

The sub-deltoid or sub-acromial bursa, which usually presents a single cavity and does not normally communicate with the shoulder-joint, is indispensable in abduction and rotation of the humerus. When the arm

is abducted, the fixed lower part or floor of the bursa is carried under the acromion, and the upper part or roof is rolled up in the same direction, hence tenderness over the inflamed bursa may disappear when the arm is abducted (Dawbarn's sign). It is liable to traumatic affections from a fall on the shoulder, pressure, or over-use of the limb. Pain, located commonly at the insertion of the deltoid, is a constant symptom and is especially annoying at night, the patient being unable to get into a comfortable position. Tenderness may be elicited over the anatomical limits of the bursa, and is usually most marked over the great tuberosity, just external to the inter-tubercular (bicipital) groove. When adhesions are present, abduction beyond 10 degrees is impossible. Demonstrable effusion is not uncommon, but is disguised by the overlying tissues. If left to himself, the patient tends to maintain the limb in the "sling position," and resists movements in the direction of abduction and rotation. In the treatment of this affection the arm should be maintained at a right angle to the body, the arm being rotated medially (Codman). When pain does not prevent it, movements of the arm and massage are persevered with. In neglected cases, when adhesions have formed and the shoulder is fixed, it may be necessary to break down the adhesions under an anaesthetic.

The bursa is also liable to infective conditions, such as acute rheumatism, gonorrhoea, suppuration, or tubercle. In tuberculous disease a large fluctuating swelling may form and acquire the characters of a cold abscess (Fig. 115).

The bursa underneath the tendon of the subscapularis muscle when inflamed causes alteration in the attitude of the shoulder and impairment of its movements.

An adventitious bursa forms over the acromion process in porters and others who carry weights on the shoulder, and may be the seat of traumatic bursitis.

The bursa under the tendon of insertion of the biceps, when the seat of disease, is attended with pain and swelling about a finger's breadth below the bend of the elbow; there is pain and difficulty in effecting the combined movement of flexion and supination, slight limitation of extension, and restriction of pronation.

In the lower extremity, a large number of normal and adventitious bursae are met with and may be the seat of bursitis. That over the tuberosity of the ischium, when enlarged as a trade disease, is known as "weaver's" or "tailor's bottom." It may form a fluctuating swelling of great size, projecting on the buttock and extending down the thigh, and causing great inconvenience in sitting (Fig. 116). It sometimes contains a number of loose bodies.

There are two bursae over the great trochanter, one superficial to, the other beneath the aponeurosis of the gluteus maximus; the latter is not infrequently infected by tuberculous disease that has spread from the trochanter.

The bursa between the psoas muscle and the capsule of the hip-joint may be the seat of tuberculous disease, and give rise to clinical features not unlike those of disease of the hip-joint. The limb is flexed, abducted and rotated out; there is a swelling in the upper part of Scarpa's triangle, but the movements are not restricted in directions which do not entail putting the ilio-psoas muscle on the stretch.

Cartilaginous and partly ossified loose bodies may accumulate in the ilio-psoas bursa and distend it, both in a downward direction towards the hip-joint, with which it communicates, and upwards, projecting towards the abdomen.

The bursa beneath the quadriceps extensor--subcrural bursa--usually communicates with the knee-joint and shares in its diseases. When shut off from the joint it may suffer independently, and when distended with fluid forms a horse-shoe swelling above the patella.

In front of the patella and its ligament is the prepatellar bursa, which may have one, two, or three compartments, usually communicating with one another. It is the seat of the affection known as "housemaid's knee," which is very common and is sometimes bilateral, and, less frequently, of tuberculous disease which usually originates in the patella.

[Illustration: FIG. 116.--Great Enlargement of the Ischial Bursa.

(Mr. Scot-Skirving's case.)]

The bursa between the ligamentum patellae and the tibia is rarely the seat of disease. When it is, there is pain and tenderness referred to the ligament, the patient is unable to extend the limb completely, the tuberosity of the tibia is apparently enlarged, and there is a fluctuating swelling on either side of the ligament, most marked in the extended position of the limb.

Of the numerous bursae in the popliteal space, that between the semi-membranosus and the medial head of the gastrocnemius is most frequently the seat of disease, which is usually of the nature of a simple hydrops, forming a fluctuating egg-or sausage-shaped swelling at the medial side of the popliteal space. It is flaccid in the flexed, and tense in the extended position. As a rule it causes little inconvenience, and may be left alone. Otherwise it should be dissected out, and if, as is frequently the case, there is a communication with the knee-joint, this should be closed with sutures.

[Illustration: FIG. 117.--Gouty Disease of Bursae in a tailor. The bursal tumours were almost entirely composed of urate of soda. (Cf. Fig. 114.)]

An adventitious bursa may form over the lateral malleolus, especially in tailors, giving rise to the condition known as "tailor's ankle" (Fig. 117).

The bursa between the tendo-calcaneus (Achillis) and the upper part of the calcaneus may become inflamed--especially as a result of post-scarlatinal rheumatism or gonorrhoea. The affection is known as Achillo-bursitis. There is severe pain in the region of the insertion of the tendo-calcaneus, the movements at the ankle-joint are restricted, and the patient may be unable to walk. There is a tender swelling on either side of the tendon. When, in spite of palliative treatment, the affection persists or relapses, it is best to excise the bursa. The tendo-calcaneus is detached from the calcaneus, the bursa dissected out, and the tendon replaced. If there is a bony projection from the calcaneus, it should be shaved off with the chisel.

The bursa that is sometimes met with on the under aspect of the calcaneus--the subcalcanean bursa--when inflamed, gives rise to pain and tenderness in the sole of the foot. This affection may be associated with a spinous projection from the bone, which is capable of being recognised in a skiagram. The soft parts of the heel are turned forwards as a flap, the bursa is dissected out, and the projection of bone, if present, is removed.

The enlargement of adventitious bursae over the head of the first metatarsal in hallux valgus; over the tarsus, metatarsus, and digits in the different forms of club-foot; over the angular projection in Pott's disease of the spine; over the end of the bone in amputation stumps, and over hard tumours such as chondroma and osteoma, are described elsewhere.

CHAPTER XX

DISEASES OF BONE

Anatomy and physiology--Regeneration of bone--Transplantation of bone.

DISEASES OF BONE--Definition of terms--Pyogenic diseases:

Acute osteomyelitis and periostitis; _Chronic and relapsing osteomyelitis_; _Abscess of bone--Tuberculous disease--Syphilitic disease--Hydatids; Rickets; Osteomalacia--Ostitis deformans of Paget--Osteomyelitis fibrosa--Affections of bones in diseases of the nervous system--Fragilitas ossium--Tumours and cysts of bone.

#Surgical Anatomy.#--During the period of growth, a long bone such as the tibia consists of a shaft or diaphysis, and two extremities or epiphyses. So long as growth continues there intervenes between the shaft and each of the epiphyses a disc of actively growing cartilage--the epiphyseal cartilage; and at the junction of this cartilage with the shaft is a zone of young, vascular, spongy bone known as the metaphysis or epiphyseal junction. The shaft is a cylinder of compact bone enclosing the medullary canal, which is filled with yellow marrow. The extremities, which include the ossifying junctions, consist of spongy bone, the spaces of which are filled with red marrow. The articular aspect of the epiphysis is invested with a thick layer of hyaline cartilage, known as the articular cartilage, which would appear to be mainly nourished from the synovia.

The external investment--the periosteum--is thick and vascular during the period of growth, but becomes thin and less vascular when the skeleton has attained maturity. Except where muscles are attached it is easily separated from the bone; at the extremities it is intimately connected with the epiphyseal cartilage and with the epiphysis, and at the margin of the latter it becomes continuous with the capsule of the adjacent joint. It consists of two layers, an outer fibrous and an inner cellular layer; the cells, which are called osteoblasts, are continuous with those lining the Haversian canals and the medullary cavity.

The arrangement of the blood vessels determines to some extent the incidence of disease in bone. The nutrient artery, after entering the medullary canal through a special foramen in the cortex, bifurcates, and one main division runs towards each of the extremities, and terminates at the ossifying junction in a series of capillary loops projected against the epiphyseal cartilage. This arrangement favours the lodgment of any organisms that may be circulating in the blood, and partly accounts for the frequency with which diseases of bacterial origin develop in the region of the ossifying junction. The diaphysis is also nourished by numerous blood vessels from the periosteum, which penetrate the cortex through the Haversian canals and anastomose with those derived from the nutrient artery. The epiphyses are nourished by a separate system of blood vessels, derived from the arteries which supply the adjacent joint. The veins of the marrow are of large calibre and are devoid of valves.

The nerves enter the marrow along with the arteries, and, being derived from the sympathetic system, are probably chiefly concerned with the innervation of the blood vessels, but they are also capable of transmitting sensory impulses, as pain is a prominent feature of many bone affections.

It has long been believed that the function of the periosteum is to form new bone, but this view has been questioned by Sir William MacEwen, who maintains that its chief function is to limit the formation of new bone. His experimental observations appear to show that new bone is exclusively formed by the cellular elements or osteoblasts: these are found on the surface of the bone, lining the Haversian canals and in the marrow. We believe that it will avoid confusion in the study of the diseases of bone if the osteoblasts on the surface of the bone are still regarded as forming the deeper layer of the periosteum.

The formation of new bone by the osteoblasts may be defective as a result of physiological conditions, such as old age and disease of a part, and defective formation is often associated with atrophy, or more strictly speaking, absorption, of the existing bone, as is well seen in the edentulous jaw and in the neck of the femur of a person advanced in years. Defective formation associated with atrophy is also illustrated

in the bones of the lower limbs of persons who are unable to stand or walk, and in the distal portion of a bone which is the seat of an ununited fracture. The same combination is seen in an exaggerated degree in the bones of limbs that are paralysed; in the case of adults, atrophy of bone predominates; in children and adolescents, defective formation is the more prominent feature, and the affected bones are attenuated, smooth on the surface, and abnormally light.

On the other hand, the formation of new bone may be exaggerated, the osteoblasts being excited to abnormal activity by stimuli of different kinds: for example, the secretion of certain glandular organs, such as the pituitary and thyreoid; the diluted toxins of certain micro-organisms, such as the staphylococcus aureus and the spirochaete of syphilis; a condition of hyperaemia, such as that produced artificially by the application of a Bier's bandage or that which accompanies a chronic leg-ulcer.

The new bone is laid down on the surface, in the Haversian canals, or in the cancellous spaces and medullary canal, or in all three situations. The new bone on the surface sometimes takes the form of a diffuse encrustation of porous or spongy bone as in secondary syphilis, sometimes as a uniform increase in the girth of the bone--hyperostosis, sometimes as a localised heaping up of bone or node, and sometimes in the form of spicules, spoken of as osteophytes. When the new bone is laid down in the Haversian canals, cancellous spaces and medulla, the bone becomes denser and heavier, and is said to be sclerosed; in extreme instances this may result in obliteration of the medullary canal. Hyperostosis and sclerosis are frequently met with in combination, a condition that is well illustrated in the femur and tibia in tertiary syphilis; if the subject of this condition is confined to bed for several months before his death, the sclerosis may be undone, and rarefaction may even proceed beyond the normal, the bone becoming lighter and richer in fat, although retaining its abnormal girth.

The function of the epiphyseal cartilage is to provide for the growth of the shaft in length. While all epiphyseal cartilages contribute to this result, certain of them functionate more actively and for a longer period than others. Those at the knee, for example, contribute more to the length of limb than do those at the hip or ankle, and they are also the last to unite. In the upper limb the more active epiphyses are at the shoulder and wrist, and these also are the last to unite.

The activity of the epiphyseal cartilage may be modified as a result of disease. In rickets, for example, the formation of new bone may take place unequally, and may go on more rapidly in one half of the disc than in the other, with the result that the axis of the shaft comes to deviate from the normal, giving rise to knock-knee or bow-knee. In bacterial diseases originating in the marrow, if the epiphyseal junction is directly involved in the destructive process, its bone-forming functions may be retarded or abolished, and the subsequent growth of the bone be seriously interfered with. On the other hand, if it is not directly involved but is merely influenced by the proximity of an infective focus, its bone-forming functions may be stimulated by the diluted toxins and the growth of the bone in length exaggerated. In paralysed limbs the growth from the epiphyses is usually little short of the normal. The result of interference with growth is more injurious in the lower than in the upper limb, because, from the functional point of view, it is essential that the lower extremities should be approximately of equal length. In the forearm or leg, where there are two parallel bones, if the growth of one is arrested the continued growth of the other results in a deviation of the hand or foot to one side.

In certain diseases, such as rickets and inherited syphilis, and in developmental anomalies such as achondroplasia, dwarfing of the skeleton results from defective growth of bone at the ossifying junctions. Conversely, excessive growth of bone at the ossifying junctions results in abnormal height of the skeleton or giantism as a result, for example, of increased activity of the pituitary in adolescents, and in eunuchs who have been castrated in childhood or

adolescence; in the latter, union of the epiphyses at the ends of the long bones is delayed beyond the usual period at which the skeleton attains maturity.

#Regeneration of Bone.--When bone has been lost or destroyed as a result of injury or disease, it is capable of being reproduced, the extent to which regeneration takes place varying under different conditions. The chief part in the regeneration of bone is played by the osteoblasts in the adjacent marrow and in the deeper layer of the periosteum. The shaft of a long bone may be reproduced after having been destroyed by disease or removed by operation. The flat bones of the skull and the bones of the face, which are primarily developed in membrane, have little capacity of regeneration; hence, when bone has been lost or removed in these situations, there results a permanent defect.

Wounds or defects in articular cartilage are repaired by fibrous or osseous tissue derived from the subjacent cancellous spaces.

Transplantation of Bone--Bone-grafting.--Clinical experience is conclusive that a portion of bone which has been completely detached from its surroundings--for example, a trephine circle, or a flap of bone detached with the saw, or the loose fragments in a compound fracture--may become, if replaced in position, firmly and permanently incorporated with the surrounding bone. Embedded foreign bodies, on the other hand, such as ivory pegs or decalcified bone, exhibit, on removal after a sufficient interval, evidence of having been eroded, in the shape of worm-eaten depressions and perforations, and do not become united or fused to the surrounding bone. It follows from this that the implanting of living bone is to be preferred to the implanting of dead bone or of foreign material. We believe that transplanted living bone when placed under favourable conditions survives and becomes incorporated with the bone with which it is in contact, and does not merely act as a scaffolding. We believe also that the retention of the periosteum on the graft is not essential, but, by favouring the establishment of vascular connections, it contributes to the survival of the graft and the success of the transplantation. Macewen maintains that bone grafts "take" better if broken up into small fragments; we regard this as unnecessary. Bone grafts yield better functional results when they are immovably fixed to the adjacent bone by suture, pegs, or plates. As in all grafting procedures, asepsis is essential.

Transplanted bone retains its vitality when embedded in the soft parts, but is gradually absorbed and replaced by fibrous tissue.

DISEASES OF BONE

The morbid processes met with in bone originate in the same way and lead to the same results as do similar processes in other tissues. The structural peculiarities of bone, however, and the important changes which take place in the skeleton during the period of growth, modify certain of the clinical and pathological features.

Definition of Terms.--Any diseased process that affects the periosteum is spoken of as periostitis; the term osteomyelitis is employed when it is located in the marrow. The term epiphysitis has been applied to an inflammatory process in two distinct situations--namely, the ossifying nucleus in the epiphysis, and the ossifying junction or metaphysis between the epiphyseal cartilage and the diaphysis. We shall restrict the term to inflammation in the first of these situations. Inflammation at the ossifying junction is included under the term osteomyelitis.

The term rarefying osteitis is applied to any process that is attended with excessive absorption of the framework of a bone, whereby it becomes more porous or spongy than it was before, a condition known as osteoporosis.

The term caries is employed to indicate any diseased process

associated with crumbling away of the trabecular framework of a bone. It may be considered as the equivalent of ulceration or molecular destruction in the soft parts. The carious process is preceded by the formation of granulation tissue in the marrow or periosteum, which eats away and replaces the bone in contact with it. The subsequent degeneration and death of the granulation tissue under the necrotic influence of bacterial toxins results in disintegration and crumbling away of the trabecular framework of the portion of bone affected. Clinically, carious bone yields a soft grating sensation under the pressure of the probe. The macerated bone presents a rough, eroded surface.

The term dry caries (caries sicca) is applied to that variety which is unattended with suppuration.

Necrosis is the term applied to the death of a tangible portion of bone, and the dead portion when separated is called a sequestrum. The term exfoliation is sometimes employed to indicate the separation or throwing off of a superficial sequestrum. The edges and deep surface of the sequestrum present a serrated or worm-eaten appearance due to the process of erosion by which the dead bone has been separated from the living.

BACTERIAL DISEASES

The most important diseases in this group are the pyogenic, the tuberculous, and the syphilitic.

PYOGENIC DISEASES OF BONE.--These diseases result from infection with pyogenic organisms, and two varieties or types are recognised according to whether the organisms concerned reach their seat of action by way of the blood-stream, or through an infection of the soft parts in contact with the bone.

INFECTIONS THROUGH THE BLOOD-STREAM

#Diseases caused by the *Staphylococcus Aureus*.#--As the majority of pyogenic diseases are due to infection with the *staphylococcus aureus*, these will be described first.

#Acute osteomyelitis# is a suppurative process beginning in the marrow and tending to spread to the periosteum. The disease is common in children, but is rare after the skeleton has attained maturity. Boys are affected more often than girls, in the proportion of three to one, probably because they are more liable to exposure, to injury, and to violent exertion.

Etiology.--*Staphylococci* gain access to the blood-stream in various ways, it may be through the skin or through a mucous surface.

Such conditions as, for example, a blow, some extra exertion such as a long walk, or exposure to cold, as in wading, may act as localising factors.

The long bones are chiefly affected, and the commonest sites are: either end of the tibia and the lower end of the femur; the other bones of the skeleton are affected in rare instances.

Pathology.--The disease commences and is most intense in the marrow of the ossifying junction at one end of the diaphysis; it may commence at both ends simultaneously--bipolar osteomyelitis; or, commencing at one end, may spread to the other.

The changes observed are those of intense engorgement of the marrow, going on to greenish-yellow purulent infiltration. Where the process is most advanced--that is, at the ossifying junction--there are evidences of absorption of the framework of the bone; the marrow spaces and Haversian canals undergo enlargement and become filled with

greenish-yellow pus. This rarefaction of the spongy bone is the earliest change seen with the X-rays.

The process may remain localised to the ossifying junction, but usually spreads along the medullary canal for a varying distance, and also extends to the periosteum by way of the enlarged Haversian canals. The pus accumulates under the periosteum and lifts it up from the bone. The extent of spread in the medullary canal and beneath the periosteum is in close correspondence. The periosteum of the diaphysis is easily separated--hence the facility with which the pus spreads along the shaft; but in the region of the ossifying junction it is raised with difficulty because of its intimate connection with the epiphyseal cartilage. Less frequently there is more than one collection of pus under the periosteum, each being derived from a focus of suppuration in the subjacent marrow. The pus perforates the periosteum, and makes its way to the surface by the easiest anatomical route, and discharges externally, forming one or more sinuses through which fresh infection may take place. The infection may spread to the adjacent joint, either directly through the epiphysis and articular cartilage, or along the deep layer of the periosteum and its continuation--the capsular ligament. When the epiphysis is intra-articular, as, for example, in the head of the femur, the pus when it reaches the surface of the bone necessarily erupts directly into the joint.

While the occurrence of purely periosteal suppuration is regarded as possible, we are of opinion that the embolic form of staphylococcal osteomyelitis always originates in the marrow.

The portion of the diaphysis which has sustained the action of the concentrated toxins has its vitality further impaired as a result of the stripping of the periosteum and thrombosis of the blood vessels of the marrow, so that necrosis of bone is one of the most striking results of the disease, and as this takes place rapidly, that is, in a day or two, the term acute necrosis, formerly applied to the disease, was amply justified.

When there is marked rarefaction of the bone at the ossifying junction, the epiphysis is liable to be separated--epiphysiolyisis. The separation usually takes place through the young bone of the ossifying junction, and the surfaces of the diaphysis and epiphysis are opposed to each other by irregular eroded surfaces bathed in pus. The separated epiphysis may be kept in place by the periosteum, but when this has been detached by the formation of pus beneath it, the epiphysis is liable to be displaced by muscular action or by some movement of the limb, or it is the diaphysis that is displaced, for example, the lower end of the diaphysis of the femur may be projected into the popliteal space.

The epiphyseal cartilage usually continues its bone-forming functions, but when it has been seriously damaged or displaced, the further growth of the bone in length may be interfered with. Sometimes the separated and displaced epiphysis dies and constitutes a sequestrum.

The adjacent joint may become filled at an early stage with a serous effusion, which may be sterile. When the cocci gain access to the joint, the lesion assumes the characters of a purulent arthritis, which, from its frequency during the earlier years of life, has been called the acute arthritis of infants.

Separation of an epiphysis nearly always results in infection and destruction of the adjacent joint.

Osteomyelitis is rare in the bones of the carpus and tarsus, and the associated joints are usually infected from the outset. In flat bones, such as the skull, the scapula, or the ilium, suppuration usually occurs on both aspects of the bone as well as in the marrow.

Clinical Features.--The constitutional symptoms, which are due to the associated toxæmia, vary considerably in different cases. In mild cases they may be so slight as to escape recognition. In exceptionally severe cases the patient may succumb before there are obvious signs of the

localisation of the staphylococci in the bone marrow. In average cases the temperature rises rapidly with a rigor and runs an irregular course with morning remissions, there is marked general illness accompanied by headache, vomiting, and sometimes delirium.

The local manifestations are pain and tenderness in relation to one of the long bones; the pain may be so severe as to prevent sleep and to cause the child to cry out. Tenderness on pressure over the bone is the most valuable diagnostic sign. At a later stage there is an ill-defined swelling in the region of the ossifying junction, with oedema of the overlying skin and dilatation of the superficial veins.

The swelling appears earlier and is more definite in superficial bones such as the tibia, than in those more deeply placed such as the upper end of the femur. It may be less evident to the eye than to the fingers, and is best appreciated by gently stroking the bone from the middle of its shaft towards the end. The maximum thickening and tenderness usually correspond to the junction of the diaphysis with the epiphysis, and the swelling tails off gradually along the shaft. As time goes on there is redness of the skin, especially over a superficial bone, such as the tibia, the swelling becomes softer, and gives evidence of fluctuation. This stage may be reached at the end of twenty-four hours, or not for some days.

Suppuration spreads towards the surface, until, some days later, the skin sloughs and pus escapes, after which the fever usually remits and the pain and other symptoms are relieved. The pus may contain blood and droplets of fat derived from the marrow, and in some cases minute particles of bone are present also. The presence of fat and bony particles in the pus confirms the medullary origin of the suppuration.

If an incision is made, the periosteum is found to be raised from the bone; the extent of the bare bone will be found to correspond fairly accurately with the extent of the lesion in the marrow.

Local Complications.--The adjacent joint may exhibit symptoms which vary from those of a simple effusion to those of a purulent arthritis. The joint symptoms may count for little in the clinical picture, or, as in the case of the hip, may so predominate as to overshadow those of the bone lesion from which they originated.

Separation and displacement of the epiphysis usually reveals itself by an alteration in the attitude of the limb; it is nearly always associated with suppuration in the adjacent joint.

When pathological fracture of the shaft occurs, as it may do, from some muscular effort or strain, it is attended with the usual signs of fracture.

Dislocation of the adjacent joint has been chiefly observed at the hip; it may result from effusion into the joint and stretching of the ligaments, or may be the sequel of a purulent arthritis; the signs of dislocation are not so obvious as might be expected, but it is attended with an alteration in the attitude of the limb, and the displacement of the head of the bone is readily shown in a skiagram.

General Complications.--In some cases a multiplicity of lesions in the bones and joints imparts to the disease the features of pyaemia. The occurrence of endocarditis, as indicated by alterations in the heart sounds and the development of murmurs, may cause widespread infective embolism, and metastatic suppurations in the kidneys, heart-wall, and lungs, as well as in other bones and joints than those primarily affected. The secondary suppurations are liable to be overlooked unless sought for, as they are rarely attended with much pain.

In these multiple forms of osteomyelitis the toxæmic symptoms predominate; the patient is dull and listless, or he may be restless and talkative, or actually delirious. The tongue is dry and coated, the lips and teeth are covered with sordes, the motions are loose and offensive, and may be passed involuntarily. The temperature is remittent and

irregular, the pulse small and rapid, and the urine may contain blood and albumen. Sometimes the skin shows erythematous and purpuric rashes, and the patient may cry out as in meningitis. The post-mortem appearances are those of pyaemia.

Differential Diagnosis.--Acute osteomyelitis is to be diagnosed from infections of the soft parts, such as erysipelas and cellulitis, and, in the case of the tibia, from erythema nodosum. Tenderness localised to the ossifying junction is the most valuable diagnostic sign of osteomyelitis.

When there is early and pronounced general intoxication, there is likely to be confusion with other acute febrile illnesses, such as scarlet fever. In all febrile conditions in children and adolescents, the ossifying junctions of the long bones should be examined for areas of pain and tenderness.

Osteomyelitis has many features in common with acute articular rheumatism, and some authorities believe them to be different forms of the same disease (Kocher). In acute rheumatism, however, the joint symptoms predominate, there is an absence of suppuration, and the pains and temperature yield to salicylates.

The prognosis varies with the type of the disease, with its location--the vertebrae, skull, pelvis, and lower jaw being specially unfavourable--with the multiplicity of the lesions, and with the development of endocarditis and internal metastases.

Treatment.--This is carried out on the same lines as in other pyogenic infections.

In the earliest stages of the disease, the induction of hyperaemia is indicated, and should be employed until the diagnosis is definitely established, and in the meantime preparations for operation should be made. An incision is made down to and through the periosteum, and whether pus is found or not, the bone should be opened in the vicinity of the ossifying junction by means of a drill, gouge, or trephine. If pus is found, the opening in the bone is extended along the shaft as far as the periosteum has been separated, and the infected marrow is removed with the spoon. The cavity is then lightly packed with rubber dam, or, as recommended by Bier, the skin edges are brought together by sutures which are loosely tied to afford sufficient space between them for the exit of discharge, and the hyperaemic treatment is continued.

When there is widespread suppuration in the marrow, and the shaft is extensively bared of periosteum and appears likely to die, it may be resected straight away or after an interval of a day or two. Early resection of the shaft is also indicated if the opening of the medullary canal is not followed by relief of symptoms. In the leg and forearm, the unaffected bone maintains the length and contour of the limb; in the case of the femur and humerus, extension with weight and pulley along with some form of moulded gutter splint is employed with a similar object.

Amputation of the limb is reserved for grave cases, in which life is endangered by toxæmia, which is attributed to the primary lesion. It may be called for later if the limb is likely to be useless, as, for example, when the whole shaft of the bone is dead without the formation of a new case, when the epiphyses are separated and displaced, and the joints are disorganised.

Flat bones, such as the skull or ilium, must be trephined and the pus cleared out from both aspects of the bone. In the vertebrae, operative interference is usually restricted to opening and draining the associated abscess.

#Nature's Effort at Repair.--In cases which are left to nature, and in which necrosis of bone has occurred, those portions of the periosteum and marrow which have retained their vitality resume their osteogenetic functions, often to an exaggerated degree. Where the periosteum has been

lifted up by an accumulation of pus, or is in contact with bone that is dead, it proceeds to form new bone with great activity, so that the dead shaft becomes surrounded by a sheath or case of new bone, known as the involutum (Fig. 118). Where the periosteum has been perforated by pus making its way to the surface, there are defects or holes in the involutum, called cloacae. As these correspond more or less in position to the sinuses in the skin, in passing a probe down one of the sinuses it usually passes through a cloaca and strikes the dead bone lying in the interior. If the periosteum has been extensively destroyed, new bone may only be formed in patches, or not at all. The dead bone is separated from the living by the agency of granulation tissue with its usual complements of phagocytes and osteoclasts, so that the sequestrum presents along its margins and on its deep surface a pitted, grooved, and worm-eaten appearance, except on the periosteal aspect, which is unaltered. Ultimately the dead bone becomes loose and lies in a cavity a little larger than itself; the wall of the cavity is formed by the new case, lined with granulation tissue. The separation of the sequestrum takes place more rapidly in the spongy bone of the ossifying junction than in the compact bone of the shaft.

When foci of suppuration have been scattered up and down the medullary cavity, and the bone has died in patches, several sequestra may be included by the new case; each portion of dead bone is slowly separated, and comes to lie in a cavity lined by granulations.

Even at a distance from the actual necrosis there is formation of new bone by the marrow; the medullary canal is often obliterated, and the bone becomes heavier and denser--sclerosis; and the new bone which is deposited on the original shaft results in an increase in the girth of the bone--hyperostosis.

[Illustration: FIG. 118.--Shaft of Femur after Acute Osteomyelitis. The shaft has undergone extensive necrosis, and a shell of new bone has been formed by the periosteum.]

Pathological fracture of the shaft may occur at the site of necrosis, when the new case is incapable of resisting the strain put upon it, and is most frequently met with in the shaft of the femur. Short of fracture, there may be bending or curving of the new case, and this results in deformity and shortening of the limb (Fig. 119).

The extrusion of a sequestrum may occur, provided there is a cloaca large enough to allow of its escape, but the surgeon has usually to interfere by performing the operation of sequestrectomy. Displacement or partial extrusion of the dead bone may cause complications, as when a sequestrum derived from the trigone of the femur perforates the popliteal artery or the cavity of the knee-joint, or a sequestrum of the pelvis perforates the wall of the urinary bladder.

The extent to which bone which has been lost is reproduced varies in different parts of the skeleton: while the long bones, the scapula, the mandible, and other bones which are developed in cartilage are almost completely re-formed, bones which are entirely developed in membrane, such as the flat bones of the skull and the maxilla, are not reproduced.

[Illustration: FIG. 119.--Femur and Tibia showing results of Acute Osteomyelitis affecting Trigone of Femur; sequestrum partly surrounded by new case; backward displacement of lower epiphysis and implication of knee-joint.]

It may be instructive to describe the X-ray appearances of a long bone that has passed through an attack of acute osteomyelitis severe enough to have caused necrosis of part of the diaphysis. The shadow of the dead bone is seen in the position of the original shaft which it represents; it is of the same shape and density as the original shaft, while its margins present an irregular contour from the erosion concerned in its separation. The sequestrum is separated from the living bone by a clear zone which corresponds to the layer of granulations lining the cavity in which it lies. This clear zone separating the shadow of the dead bone from that of the living bone by which it is surrounded is conclusive

evidence of a sequestrum. The medullary canal in the vicinity of the sequestrum being obliterated, is represented by a shadow of varying density, continuous with that of the surrounding bone. The shadow of the new case or involucrum with its wavy contour is also in evidence, with its openings or cloacae, and is mainly responsible for the increase in the diameter of the bone.

The skiagram may also show separation and displacement of the adjacent epiphysis and destruction of the articular surfaces or dislocation of the joint.

Sequelae of Acute Suppurative Osteomyelitis.--The commonest sequel is the presence of a sequestrum with one or more discharging sinuses; owing to the abundant formation of scar tissue these sinuses have rigid edges which are usually depressed and adherent to the bone.

The Recognition and Removal of Sequestra.--So long as there is dead bone there will be suppuration from the granulations lining the cavity in which it lies, and a discharge of pus from the sinuses, so that the mere persistence of discharge after an attack of osteomyelitis, is presumptive evidence of the occurrence of necrosis. Where there are one or more sinuses, the passage of a probe which strikes bare bone affords corroboration of the view that the bone has perished. When the dead bone has been separated from the living, the X-rays yield the most exact information.

The traditional practice is to wait until the dead bone is entirely separated before undertaking an operation for its removal, from fear, on the one hand, of leaving portions behind which may keep up the discharge, and, on the other, of removing more bone than is necessary. This practice need not be adhered to, as by operating at an earlier stage healing is greatly hastened. If it is decided to wait for separation of the dead bone, drainage should be improved, and the infective element combated by the induction of hyperaemia.

The operation for the removal of the dead bone (sequestrectomy) consists in opening up the periosteum and the new case sufficiently to allow of the removal of all the dead bone, including the most minute sequestra. The limb having been rendered bloodless, existing sinuses are enlarged, but if these are inconveniently situated--for example, in the centre of the popliteal space in necrosis of the femoral trigone--it is better to make a fresh wound down to the bone on that aspect of the limb which affords best access, and which entails the least injury of the soft parts. The periosteum, which is thick and easily separable, is raised from the new case with an elevator, and with the chisel or gouge enough of the new bone is taken away to allow of the removal of the sequestrum. Care must be taken not to leave behind any fragment of dead bone, as this will interfere with healing, and may determine a relapse of suppuration.

The dead bone having been removed, the lining granulations are scraped away with a spoon, and the cavity is disinfected.

There are different ways of dealing with a bone cavity. It may be packed with gauze (impregnated with "bipp" or with iodoform), which is changed at intervals until healing takes place from the bottom; it may be filled with a flap of bone and periosteum raised from the vicinity, or with bone grafts; or the wall of bone on one side of the cavity may be chiselled through at its base, so that it can be brought into contact with the opposite wall. The method of filling bone cavities devised by Mosetig-Moorhof, consists in disinfecting and drying the cavity by a current of hot air, and filling it with a mixture of powdered iodoform (60 parts) and oil of sesame and spermaceti (each 40 parts), which is fluid at a temperature of 112° F.; the soft parts are then brought together without drainage. As the cavity fills up with new bone the iodoform is gradually absorbed. Iodoform gives a dark shadow with the X-rays, so that the process of its absorption can be followed in skiagrams taken at intervals.

These procedures may be carried out at the same time as the sequestrum

is removed, or after an interval. In all of them, asepsis is essential for success.

The deformities resulting from osteomyelitis are more marked the earlier in life the disease occurs. Even under favourable conditions, and with the continuous effort at reconstruction of the bone by Nature's method, the return to normal is often far from perfect, and there usually remains a variable amount of hyperostosis and sclerosis and sometimes curving of the bone. Under less favourable conditions, the late results of osteomyelitis may be more serious. Shortening is not uncommon from interference with growth at the ossifying junction.

Exaggerated growth in the length of a bone is rare, and has been observed chiefly in the bones of the leg. Where there are two parallel bones--as in the leg, for example--the growth of the diseased bone may be impaired, and the other continuing its normal growth becomes disproportionately long; less frequently the growth of the diseased bone is exaggerated, and it becomes the longer of the two. In either case, the longer bone becomes curved. An obliquity of the bone may result when one half of the epiphyseal cartilage is destroyed and the other half continues to form bone, giving rise to such deformities as knock-knee and club-hand.

Deformity may also result from vicious union of a pathological fracture, permanent displacement of an epiphysis, contracture, ankylosis, or dislocation of the adjacent joint.

#Relapsing Osteomyelitis.--As the term indicates, the various forms of relapsing osteomyelitis date back to an antecedent attack, and their occurrence depends on the capacity of staphylococci to lie latent in the marrow.

Relapse may take place within a few months of the original attack, or not for many years. Cases are sometimes met with in which relapses recur at regular intervals for several years, the tendency, however, being for the attacks to become milder as the virulence of the organisms becomes more and more attenuated.

Clinical Features.--Osteomyelitis in a patient over twenty-five is nearly always of the relapsing variety. In some cases the bone becomes enlarged, with pain and tenderness on pressure; in others there are the usual phenomena which attend suppuration, but the pus is slow in coming to the surface, and the constitutional symptoms are slight. The pus may escape by new channels, or one of the old sinuses may re-open. Radiograms usually furnish useful information as to the condition of the bone, both as it is altered by the original attack and by the changes that attend the relapse of the infective process.

Treatment.--In cases of thickening of the bone with persistent and severe pain, if relief is not afforded by the repeated application of blisters, the thickened periosteum should be incised, and the bone opened up with the chisel or trephine. In cases attended with suppuration, the swelling is incised and drained, and if there is a sequestrum, it must be removed.

#Circumscribed Abscess of Bone--"Brodie's Abscess."--The most important form of relapsing osteomyelitis is the circumscribed abscess of bone first described by Benjamin Brodie. It is usually met with in young adults, but we have met with it in patients over fifty. Several years may intervene between the original attack of osteomyelitis and the onset of symptoms of abscess.

Morbid Anatomy. [7]--The abscess is nearly always situated in the central axis of the bone in the region of the ossifying junction, although cases are occasionally met with in which it lies nearer the middle of the shaft. In exceptional cases there is more than one abscess (Fig. 120). The tibia is the bone most commonly affected, but the lower end of the femur, or either end of the humerus, may be the seat of the abscess. In the quiescent stage the lesion is represented by a small cavity in the bone, filled with clear serum, and lined by a fibrous membrane which is engaged in forming bone. Around the cavity the bone is

sclerosed, and the medullary canal is obliterated. When the infection becomes active, the contents of the cavity are transformed into a greenish-yellow pus from which the staphylococcus can be isolated, and the cavity is lined by a thin film of granulation tissue which erodes the surrounding bone and so causes the abscess to increase in size. If the erosion proceeds uniformly, the cavity is spherical or oval; if it is more active at some points than others, diverticula or tunnels are formed, and one of these may finally erupt through the shell of the bone or into an adjacent joint. Small irregular sequestra are occasionally found within the abscess cavity. In long-standing cases it is common to find extensive obliteration of the medullary canal, and a considerable increase in the girth of the bone.

[7] Alexis Thomson, *Edin. Med. Journ.*, 1906.

[Illustration: FIG. 120.--Segment of Tibia resected for Brodie's Abscess. The specimen shows two separate abscesses in the centre of the shaft, the lower one quiescent, the upper one active and increasing in size.]

The size of the abscess ranges from that of a cherry to that of a walnut, but specimens in museums show that, if left to Nature, the abscess may attain much greater dimensions.

The affected bone is not only thicker and heavier than normal, but may also be curved or otherwise deformed as a result of the original attack of osteomyelitis.

The clinical features are almost exclusively local. Pain, due to tension within the abscess, is the dominant symptom. At first it is vague and difficult to localise, later it is referred to the interior of the bone, and is described as "boring." It is aggravated by use of the limb, and there are often, especially during the night, exacerbations in which the pain becomes excruciating. In the early stages there are periods of days or weeks during which the symptoms abate, but as the abscess increases these become shorter, until the patient is hardly ever free from pain. Localised tenderness can almost always be elicited by percussion, or by compressing the bone between the fingers and thumb. The pain induced by the traction of muscles attached to the bone, or by the weight of the body, may interfere with the function of the limb, and in the lower extremity cause a limp in walking. The limb may be disabled from involvement of the adjacent joint, in which there may be an intermittent hydrops which comes and goes coincidently with exacerbations of pain; or the abscess may perforate the joint and set up an acute arthritis.

The diagnosis of Brodie's abscess from other affections met with at the ends of long bones, and particularly from tuberculosis, syphilis, and new growths, is made by a consideration of the previous history, especially with reference to an antecedent attack of osteomyelitis. When the adjacent joint is implicated, the surgeon may be misled by the patient referring all the symptoms to the joint.

The X-ray picture is usually diagnostic chiefly because all the lesions which are liable to be confused with Brodie's abscess--gumma, tubercle, myeloma, chondroma, and sarcoma--give a well-marked central clear area; the sclerosis around Brodie's abscess gives a dense shadow in which the central clear area is either not seen at all or only faintly (Fig. 121).

Treatment.--If an abscess is suspected, there should be no hesitation in exploring the interior of the bone. It is exposed by a suitable incision; the periosteum is reflected and the bone is opened up by a trephine or chisel, and the presence of an abscess may be at once indicated by the escape of pus. If, owing to the small size of the abscess or the density of the bone surrounding it, the pus is not reached by this procedure, the bone should be drilled in different directions.

[Illustration: FIG. 121.--Radiogram of Brodie's Abscess in Lower End of Tibia.]

#Other Forms of Acute Osteomyelitis.--Among the less severe forms of osteomyelitis resulting from the action of attenuated organisms are the serous variety, in which an effusion of serous fluid forms under the periosteum; and growth fever, in which the child complains of vague evanescent pains (growing pains), and of feeling tired and disinclined to play; there may be some rise of temperature in the evening.

Infection with the staphylococcus albus, the streptococcus, or the pneumococcus also causes a mild form of osteomyelitis which may go on to suppuration.

Necrosis without suppuration, described by Paget under the name "quiet necrosis," is a rare disease, and would appear to be associated with an attenuated form of staphylococcal infection (Tavel). It occurs in adults, being met with up to the age of fifty or sixty, and is characterised by the insidious development of a swelling which involves a considerable extent of a long bone. The pain varies in intensity, and may be continuous or intermittent, and there is tenderness on pressure. The shaft is increased in girth as a result of its being surrounded by a new case of bone. The resemblance to sarcoma may be very close, but the swelling is not as defined as in sarcoma, nor does it ever assume the characteristic "leg of mutton" shape. In both diseases there is a tendency to pathological fracture. It is difficult also in the absence of skiagrams to differentiate the condition from syphilitic and from tuberculous disease. If the diagnosis is not established after examination with the X-rays, an exploratory incision should be made; if dead bone is found, it is removed.

In typhoid fever the bone marrow is liable to be invaded by the typhoid bacillus, which may set up osteomyelitis soon after its lodgment, or it may lie latent for a considerable period before doing so. The lesions may be single or multiple, they involve the marrow or the periosteum or both, and they may or may not be attended with suppuration. They are most commonly met with in the tibia and in the ribs at the costo-chondral junctions.

The bone lesions usually occur during the seventh or eighth week of the fever, but have been known to occur much later. The chief complaint is of vague pains, at first referred to several bones, later becoming localised in one; they are aggravated by movement, or by handling the bone, and are worst at night. There is redness and oedema of the overlying soft parts, and swelling with vague fluctuation, and on incision there escapes a yellow creamy pus, or a brown syrupy fluid containing the typhoid bacillus in pure culture. Necrosis is exceptional.

When the abscess develops slowly, the condition resembles tuberculous disease, from which it may be diagnosed by the history of typhoid fever, and by obtaining a positive Widal reaction.

The prognosis is favourable, but recovery is apt to be slow, and relapse is not uncommon.

It is usually sufficient to incise the periosteum, but when the disease occurs in a rib it may be necessary to resect a portion of bone.

#Pyogenic Osteomyelitis due to Spread of Infection from the Soft Parts.--There still remain those forms of osteomyelitis which result from infection through a wound involving the bone--for example, compound fractures, gun-shot injuries, osteotomies, amputations, resections, or operations for un-united fracture. In all of these the marrow is exposed to infection by such organisms as are present in the wound. A similar form of osteomyelitis may occur apart from a wound--for example, infection may spread to the jaws from lesions of the mouth; to the skull, from lesions of the scalp or of the cranial bones themselves--such as a syphilitic gumma or a sarcoma which has fungated externally; or to the petrous temporal, from suppuration in the middle ear.

The most common is an osteomyelitis commencing in the marrow exposed in a wound infected with pyogenic organisms. In amputation stumps, fungating granulations protrude from the sawn end of the bone, and if necrosis takes place, the sequestrum is annular, affecting the cross-section of the bone at the saw-line; or tubular, extending up the shaft, and tapering off above. The periosteum is more easily detached, is thicker than normal, and is actively engaged in forming bone. In the macerated specimen, the new bone presents a characteristic coral-like appearance, and may be perforated by cloacae (Fig. 122).

[Illustration: FIG. 122.--Tubular Sequestrum resulting from Septic Osteomyelitis in Amputation Stump.]

Like other pyogenic infections, it may terminate in pyaemia, as a result of septic phlebitis in the marrow.

The clinical features of osteomyelitis in an amputation stump are those of ordinary pyogenic infection; the involvement of the bone may be suspected from the clinical course, the absence of improvement from measures directed towards overcoming the sepsis in the soft parts, and the persistence of suppuration in spite of free drainage, but it is not recognised unless the bone is exposed by opening up the stump or the changes in the bone are shown by the X-rays. The first change is due to the deposit of new bone on the periosteal surface; later, there is the shadow of the sequestrum.

Healing does not take place until the sequestrum is extruded or removed by operation.

In compound fractures, if a fragment dies and forms a sequestrum, it is apt to be walled in by new bone; the sinuses continue to discharge until the sequestrum is removed. Even after healing has taken place, relapse is liable to occur, especially in gun-shot injuries. Months or years afterwards, the bone may become painful and tender. The symptoms may subside under rest and elevation of the limb and the application of a compress, or an abscess forms and bursts with comparatively little suffering. The contents may be clear yellow serum or watery pus; sometimes a small spicule of bone is discharged. Valuable information, both for diagnosis and treatment, is afforded by skiagrams.

[Illustration: FIG. 123.--New Periosteal Bone on surface of Femur from Amputation Stump. Osteomyelitis supervened on the amputation, and resulted in necrosis at the sawn section of the bone. (Anatomical Museum, University of Edinburgh.)]

TUBERCULOUS DISEASE

The tuberculous diseases of bone result from infection of the marrow or periosteum by tubercle bacilli conveyed through the arteries; it is exceedingly rare for tubercle to appear in bone as a primary infection, the bacilli being usually derived from some pre-existing focus in the bronchial glands or elsewhere. According to the observations of John Fraser, 60 per cent. of the cases of bone and joint tubercle in children are due to the bovine bacillus, 37 per cent. to the human variety, and in 3 per cent. both types are present.

Tuberculous disease in bone is characterised by its insidious onset and slow progress, and by the frequency with which it is associated with disease of the adjacent joint.

#Periosteal tuberculosis# is met with in the ribs, sternum, vertebral column, skull, and less frequently in the long bones of the limbs. It may originate in the periosteum, or may spread thence from the marrow, or from synovial membrane.

In superficial bones, such as the sternum, the formation of tuberculous granulation tissue in the deeper layer of the periosteum, and its subsequent caseation and liquefaction, is attended by the insidious development of a doughy swelling, which is not as a rule

painful, although tender on pressure. While the swelling often remains quiescent for some time, it tends to increase in size, to become boggy or fluctuating, and to assume the characters of a cold abscess. The pus perforates the fibrous layer of the periosteum, invading and infecting the overlying soft parts, its spread being influenced by the anatomical arrangement of the tissues. The size of the abscess affords no indication of the extent of the bone lesion from which it originates. As the abscess reaches the surface, the skin becomes of a dusky red or livid colour, is gradually thinned out, and finally sloughs, forming a sinus. A probe passed into the sinus strikes carious bone. Small sequestra may be found embedded in the granulation tissue. The sinus persists as long as any active tubercle remains in the tissues, and is apt to form an avenue for pyogenic infection.

In deeply seated bones, such as the upper end of the femur, the formation of a cold abscess in the soft parts is often the first evidence of the disease.

Diagnosis.--Before the stage of cold abscess is reached, the localised swelling is to be differentiated from a gumma, from chronic forms of staphylococcal osteomyelitis, from enlarged bursa or ganglion, from sub-periosteal lipoma, and from sarcoma. Most difficulty is met with in relation to periosteal sarcoma, which must be differentiated either by the X-ray appearances or by an exploratory incision.

X-ray appearances in periosteal tubercle: the surface of the cortical bone in the area of disease is roughened and irregular by erosion, and in the vicinity there may be a deposit of new bone on the surface, particularly if a sinus is present and mixed infection has occurred; in syphilis the shadow of the bone is denser as a result of sclerosis, and there is usually more new bone on the surface--hyperostosis; in periosteal sarcoma there is greater erosion and consequently greater irregularity in the contour of the cortical bone, and frequently there is evidence of formation of bone in the form of characteristic spicules projecting from the surface at a right angle.

The early recognition of periosteal lesions in the articular ends of bones is of importance, as the disease, if left to itself, is liable to spread to the adjacent joint.

The treatment is that of tuberculous lesions in general; if conservative measures fail, the choice lies between the injection of iodoform, and removal of the infected tissues with the sharp spoon. In the ribs it is more satisfactory to remove the diseased portion of bone along with the wall of the associated abscess or sinus. If all the tubercle has been removed and there is no pyogenic infection, the wound is stitched up with the object of obtaining primary union; otherwise it is treated by the open method.

#Tuberculous Osteomyelitis.--Tuberculous lesions in the marrow occur as isolated or as multiple foci of granulation tissue, which replace the marrow and erode the trabeculae of bone in the vicinity (Fig. 124). The individual focus varies in size from a pea to a walnut. The changes that ensue resemble in character those in other tissues, and the extent of the destruction varies according to the way in which the tubercle bacillus and the marrow interact upon one another. The granulation tissue may undergo caseation and liquefaction, or may become encapsulated by fibrous tissue--"encysted tubercle."

[Illustration: FIG. 124.--Tuberculous Osteomyelitis of Os Magnum, excised from a boy aet. 8. Note well-defined caseous focus, with several minute foci in surrounding marrow.]

Sometimes the tuberculous granulation tissue spreads in the marrow, assuming the characters of a diffuse infiltration--diffuse tuberculous osteomyelitis. The trabecular framework of the bone undergoes erosion and absorption--rarefying osteitis--and either disappears altogether or only irregular fragments or sequestra of microscopic dimensions remain in the area affected. Less frequently the trabecular framework is added to by the formation of new bone, resulting in a remarkable degree of

sclerosis, and if, following upon this, there is caseation of the tubercle and death of the affected portion of bone, there results a sequestrum often of considerable size and characteristic shape, which, because of the sclerosis and surrounding endarteritis, is exceedingly slow in separating. When the sequestrum involves an articular surface it is often wedge-shaped; in other situations it is rounded or truncated and lies in the long axis of the medullary canal (Fig. 125). Finally, the sequestrum lies loose in a cavity lined by tuberculous granulation tissue, and is readily identified in a radiogram. This type of sclerosis preceding death of the bone is highly characteristic of tuberculosis.

[Illustration: FIG. 125.--Tuberculous Disease of Child's Tibia, showing sequestrum in medullary cavity, and increase in girth from excess of new bone.]

Clinical Features. --As a rule, it is only in superficially placed bones, such as the tibia, ulna, clavicle, mandible, or phalanges, that tuberculous disease in the marrow gives rise to signs sufficiently definite to allow of its clinical recognition. In the vertebrae, or in the bones of deeply seated joints, such as the hip or shoulder, the existence of tuberculous lesions in the marrow can only be inferred from indirect signs--such, for example, as rigidity and curvature in the case of the spine, or from the symptoms of grave and persistent joint-disease in the case of the hip or shoulder.

With few exceptions, tuberculous disease in the interior of a bone does not reveal its presence until by extension it reaches one or other of the surfaces of the bone. In the shaft of a long bone its eruption on the periosteal surface is usually followed by the formation of a cold abscess in the overlying soft parts. When situated in the articular ends of bones, the disease more often erupts in relation to the reflection of the synovial membrane or directly on the articular surface--in either case giving rise to disease of the joint (Fig. 156).

[Illustration: Fig. 126.--Diffuse Tuberculous Osteomyelitis of Right Tibia.

(Photograph lent by Sir H. J. Stiles.)]

#Diffuse Tuberculous Osteomyelitis in the shaft of a long bone# is comparatively rare, and has been observed chiefly in the tibia and the ulna in children (Fig. 126). It commences at the growing extremity of the diaphysis, and spreads along the medulla to a variable extent; it is attended by the formation of vascular and porous bone on the surface, which causes thickening of the diaphysis; this is most marked at the ossifying junction and tapers off along the shaft. The infection not only spreads along the medulla, but it invades the spongy bone surrounding this, and then the cortical bone, and is only prevented from reaching the soft parts by the new bone formed by the periosteum. The bone is replaced by granulation tissue, and disappears, or part of it may become sclerosed and in time form a sequestrum. In the macerated specimen, the sequestrum appears small in proportion to the large cavity in which it lies. All these changes are revealed in a good skiagram, which not only confirms the diagnosis, but, in many instances, demonstrates the extent of the disease, the presence or absence of a sequestrum, and the amount of new bone on the surface. Finally the periosteum gives way, and an abscess forms in the soft parts; and if left to itself ruptures externally, leaving a sinus. The most satisfactory treatment is to resect sub-periosteally the diseased portion of the diaphysis.

In cancellous bones, such as those of the tarsus, there is a similar caseous infiltration in the marrow, and this may be attended with the formation of a sequestrum either in the interior of the bone or involving its outer shell, as shown in Fig. 127. The situation and extent of the disease are shown in X-ray photographs. After the tuberculous granulation tissue erupts through the cortex of the bone, it gives rise to a cold abscess or infects adjacent joints or tendon sheaths.

[Illustration: FIG. 127.--Advanced Tuberculous Disease in region of Ankle. The ankle-joint is ankylosed, and there is a large sequestrum in the calcaneus.]

(Specimen in Anatomical Museum, University of Edinburgh.)]

If an exact diagnosis is made at an early stage of the disease--and this is often possible with the aid of X-rays--the affected bone is excised sub-periosteally or its interior is cleared out with the sharp spoon and gouge, the latter procedure being preferred in the case of the calcaneus to conserve the stability of the heel. When several bones and joints are simultaneously affected, and there are sinuses with mixed infection, amputation is usually indicated, especially in adults.

#Tuberculous dactylitis# is the name applied to a diffuse form of the disease as it affects the phalanges, metacarpal or metatarsal bones. The lesion presents, on a small scale, all the anatomical changes that have been described as occurring in the medulla of the tibia or ulna, and they are easily followed in skiagrams. A periosteal type of dactylitis is also met with.

The clinical features are those of a spindle-shaped swelling of a finger or toe, indolent, painless, and interfering but little with the function of the digit. Recovery may eventually occur without suppuration, but it is common to have the formation of a cold abscess, which bursts and forms one or more sinuses. It may be difficult to differentiate tuberculous dactylitis from the enlargement of the phalanges in inherited syphilis (syphilitic dactylitis), especially when the tuberculous lesion occurs in a child who is the subject of inherited syphilis.

[Illustration: FIG. 128.--Tuberculous Dactylitis.]

In the syphilitic lesion, skiagrams usually show a more abundant formation of new bone, but in many cases the doubt is only cleared up by observing the results of the tuberculin test or the effects of anti-syphilitic treatment.

Sarcoma of a phalanx or metacarpal bone may closely resemble a dactylitis both clinically and in skiagrams, but it is rare.

Treatment.--Recovery under conservative measures is not uncommon, and the functional results are usually better than those following upon operative treatment, although in either case the affected finger is liable to be dwarfed (Fig. 129). The finger should be immobilised in a splint, and a Bier's bandage applied to the upper arm. Operative interference is indicated if a cold abscess develops, if there is a persistent sinus, or if a sequestrum has formed, a point upon which information is obtained by examination with the X-rays. When a toe is affected, amputation is the best treatment, but in the case of a finger it is rarely called for. In the case of a metacarpal or metatarsal bone, sub-periosteal resection is the procedure of choice, saving the articular ends if possible.

[Illustration: FIG. 129.--Shortening of Middle Finger of Adult, the result of Tuberculous Dactylitis in childhood.]

SYPHILITIC DISEASE

Syphilitic affections of bone may be met with at any period of the disease, but the graver forms occur in the tertiary stage of acquired and inherited syphilis. The virus is carried by the blood-stream to all parts of the skeleton, but the local development of the disease appears to be influenced by a predisposition on the part of individual bones.

Syphilitic diseases of bone are much less common in practice than those due to pyogenic and tuberculous infectious, and they show a marked predilection for the tibia, sternum, and skull. They differ from tuberculous affections in the frequency with which they attack the

shafts of bones rather than the articular ends, and in the comparative rarity of joint complications.

Evanescent periostitis is met with in acquired syphilis during the period of the early skin eruptions. The patient complains, especially at night, of pains over the frontal bone, ribs, sternum, tibiae, or ulnae. Localised tenderness is elicited on pressure, and there is slight swelling, which, however, rarely amounts to what may be described as a periosteal node.

In the later stages of acquired syphilis, gummatus periostitis and osteomyelitis occur, and are characterised by the formation in the periosteum and marrow of circumscribed gummata or of a diffuse gummatus infiltration. The framework of the bone is rarefied in the area immediately involved, and sclerosed in the parts beyond. If the gummatus tissue degenerates and breaks down, and especially if the overlying skin is perforated and septic infection is superadded, the bone disintegrates and exhibits the condition known as syphilitic caries; sometimes a portion of bone has its blood supply so far interfered with that it dies--syphilitic necrosis. Syphilitic sequestra are heavier and denser than normal bone, because sclerosis usually precedes death of the bone. The bones especially affected by gummatus disease are: the skull, the septum of the nose, the nasal bones, palate, sternum, femur, tibia, and the bones of the forearm.

In the bones of the skull, gummata may form in the peri-cranium, diploe, or dura mater. An isolated gumma forms a firm elastic swelling, shading off into the surroundings. In the macerated bone there is a depression or an actual perforation of the calvaria; multiple gummata tend to fuse with one another at their margins, giving the appearance of a combination of circles: these sometimes surround an area of bone and cut it off from its blood supply (Fig. 130). If the overlying skin is destroyed and septic infection superadded, such an isolated area of bone is apt to die and furnish a sequestrum; the separation of the dead bone is extremely slow, partly from the want of vascularity in the sclerosed bone round about, and partly from the density of the sequestrum. In exceptional cases the necrosis involves the entire vertical plate of the frontal bone. Pus is formed between the bone and the dura (suppurative pachymeningitis), and this may be followed by cerebral abscess or by pyaemia. Gummatus disease in the wall of the orbit may cause displacement of the eye and paralysis of the ocular muscles.

[Illustration: FIG. 130.--Syphilitic Disease of Skull, showing a sequestrum in process of separation.]

On the inner surface of the skull, the formation of gummatus tissue may cause pressure on the brain and give rise to intense pain in the head, Jacksonian epilepsy, or paralysis, the symptoms varying with the seat and extent of the disease. The cranial nerves may be pressed upon at the base, especially at their points of exit, and this gives rise to symptoms of irritation or paralysis in the area of distribution of the nerves affected.

In the septum of the nose, the nasal bones, and the hard palate, gummatus disease causes ulceration, which, beginning in the mucous membrane, spreads to the bones, and being complicated with septic infection leads to caries and necrosis. In the nose, the disease is attended with stinking discharge (ozoena), the extrusion of portions of dead bone, and subsequently with deformity characterised by loss of the bridge of the nose; in the palate, it is common to have a perforation, so that the air escapes through the nose in speaking, giving to the voice a characteristic nasal tone.

Syphilitic disease of the tibia may be taken as the type of the affection as it occurs in the long bones. Gummatus disease in the periosteum may be localised and result in the formation of a well-defined node, or the whole shaft may become the seat of an irregular nodular enlargement (Fig. 132). If the bone is macerated, it is found to be heavier and bulkier than normal; there is diffuse sclerosis with obliteration of the medullary canal, and the surface is

uneven from heaping up of new bone--hyperostosis (Fig. 131). If a periosteal gumma breaks down and invades the skin, a syphilitic ulcer is formed with carious bone at the bottom. A central gumma may eat away the surrounding bone to such an extent that the shaft undergoes pathological fracture. In the rare cases in which it attacks the articular end of a long bone, gummatous disease may implicate the adjacent joint and give rise to syphilitic arthritis.

[Illustration: FIG. 131.--Syphilitic Hyperostosis and Sclerosis of Tibia, on section and on surface view.]

Clinical Features.--There is severe boring pain--as if a gimlet were being driven into the bone. It is worst at night, preventing sleep, and has been ascribed to compression of the nerves in the narrowed Haversian canals.

The periosteal gumma appears as a smooth, circumscribed swelling which is soft and elastic in the centre and firm at the margins, and shades off into the surrounding bone. The gumma may be completely absorbed or it may give place to a hard node. In some cases the gumma softens in the centre, the skin becomes adherent, thin, and red, and finally gives way. The opening in the skin persists as a sinus, or develops into a typical ulcer with irregular, crescentic margins; in either case a probe reveals the presence of carious bone or of a sequestrum. The health may be impaired as a result of mixed infection, and the absorption of toxins and waxy degeneration in the viscera may ultimately be induced.

A central gumma in a long bone may not reveal its presence until it erupts through the shell and reaches the periosteal surface or invades an adjacent joint. Sometimes the first manifestation is a fracture of the bone produced by slight violence.

In radiograms the appearance of syphilitic bones is usually characteristic. When there is hyperostosis and sclerosis, the shaft appears denser and broader than normal, and the contour is uneven or wavy. When there is a central gumma, the shadow is interrupted by a rounded clear area, like that of a chondroma or myeloma, but there is sclerosis round about.

Diagnosis.--The conditions most liable to be mistaken for syphilitic disease of bone are chronic staphylococcal osteomyelitis, tuberculosis, and sarcoma; and the diagnosis is to be made by the history and progress of the disease, the result of examination with the X-rays, and the results of specific tests and treatment.

Treatment.--The general health is to be improved by open air, by nourishing food, and by the administration of cod-liver oil, iron, and arsenic. Anti-syphilitic remedies should be given, and if they are administered before there is any destruction of tissue, the benefit derived from them is usually marked.

Radiograms show the rapid absorption of the new bone both on the surface and in the marrow, and are of value in establishing the therapeutic diagnosis.

In certain cases, and particularly when there are destructive changes in the bone complicated with pyogenic infection, specific remedies have little effect. In cases of persistent or relapsing gummatous disease with ulceration of skin, it is often necessary to remove the diseased soft parts with the sharp spoon and scissors, and to gouge or chisel away the unhealthy bone, on the same lines as in tuberculous disease. When hyperostosis and sclerosis of the bone is attended with severe pain which does not yield to blistering, the periosteum may be incised and the sclerosed bone perforated with a drill or trephine.

#Lesions of Bone in Inherited Syphilis.#--Craniotabes_, in which the flat bones of the skull undergo absorption in patches, was formerly regarded as syphilitic, but it is now known to result from prolonged malnutrition from any cause. Bossing of the skull resulting in the formation of Parrot's nodes is also being withdrawn from the category of

syphilitic affections. The lesions in infancy--epiphysitis, bossing of the skull, and craniotabes--have been referred to in the chapter on inherited syphilis.

Epiphysitis or Syphilitic Perichondritis.--The first of these terms is misleading, because the lesion involves the ossifying junction and the shaft of the bone, and the epiphysis only indirectly. The young bone is replaced by granulation tissue, so that large clear areas are seen with the X-rays. The symptoms are referred to the joint, because it is there that the muscles are inserted and drag on the perichondrium when movement occurs; swelling is most marked in the vicinity of the joint, and it may be added to by effusion into the synovial cavity. The baby, usually under six months, is noticed to be feverish and fretful and to cry when touched. The mother discovers that the pain is caused by moving a particular limb, usually the arm, as the humerus, radius, and ulna are the bones most commonly affected; the limb, moreover, hangs useless at the side as if paralysed, and the condition was formerly described as syphilitic pseudo-paralysis.

The lesions met with later correspond to those of the tertiary period of the acquired disease, but as they affect bones which are still actively growing, the effects are more striking. Gummatous disease may come and go over periods of many years, with the result that the external appearance and architectural arrangement of a long bone come to be profoundly altered. In the tibia, for example, the shaft is bowed forward in a gentle curve, which is compared to the curve of a sabre--"sabre-blade" deformity (Fig. 132). The diffuse thickening all round the bone obscures the sharp margins so that the bone becomes circular in section and the anterior and mesial edges are blunted, and the comparison to a cucumber is deserved. In some cases the tibia is actually increased in length as well as in girth.

[Illustration: FIG. 132.--Sabre-blade Deformity of Left Tibia in Inherited Syphilis.

(From a photograph lent by Sir George T. Beatson.)]

The contrast between the grossly enlarged and misshapen tibia and the normal or even attenuated fibula is a striking one.

Treatment is carried out on lines similar to those recommended in the acquired disease. When curving of the tibia causes disability in walking, the bone may be straightened by a cuneiform resection.

Syphilitic dactylitis is met with chiefly in children. It may affect any of the fingers or toes, but is commonest in the first phalanx of the index-finger or of the thumb. Several fingers may be attacked at the same time or in succession. The lesion consists in a gummatous infiltration of the soft parts surrounding the phalanx, or a gummatous osteomyelitis, but there is practically no tendency to break down and discharge, or to the formation of a sequestrum as is so common in tuberculous dactylitis.

The finger becomes the seat of a swelling, which is more evident on the dorsal aspect, and, according to the distribution and extent of the disease, it is acorn-shaped, fusiform, or cylindrical. It is firm and elastic, and usually painless. The movements are impaired, especially if the joints are involved. In its early stages the disease is amenable to anti-syphilitic treatment, and complete recovery is the rule.

HYDATID DISEASE

This rare disease results from the lodgment of the embryos of the taenia echinoccus, which are conveyed to the marrow by the blood-stream. The cysts are small, usually about the size of a pin-head, and they are present in enormous numbers scattered throughout the marrow. The parts of the skeleton most often affected are the articular ends of the long bones, the bodies of the vertebrae, and the pelvis.

As the cysts increase in number and in size, the framework of the bone is gradually absorbed, and there result excavations or cavities. The marrow and spongy bone first disappear, the compact tissue then becomes thin, and pathological fracture may result. The bone becomes expanded, and the cysts may escape through perforations into the surrounding cellular tissue, and when thus freed from confinement may attain considerable dimensions. Suppuration from superadded pyogenic infection may be attended with extensive necrosis, and lead to disorganisation of the adjacent joint.

Clinical Features.--The patient complains of deep-seated pains. In superficial bones, such as the tibia, there is enlargement, and it may be possible to recognise egg-shell crackling, or unequal consistence of the bone, which is hard in some parts, and doughy and elastic in others. The disease may pursue an indolent course during months or years until some complication occurs, such as suppuration or fracture. With the occurrence of suppuration the disease becomes more active, and abscesses may form in the soft parts and in the adjacent joint. In the vertebral column, hydatids give rise to angular deformity and paraplegia. In the pelvis, there is usually great enlargement of the bones, and when suppuration occurs it is apt to infect the hip-joint and to terminate fatally.

Examination with the X-rays shows the characteristic excavations of the bone caused by the cysts. The disease is liable to be mistaken for central tumour, gumma, tuberculosis, or abscess of bone.

The treatment consists in thorough eradication of the parasite by operation. The bone is laid open and scraped or resected according to the extent of the disease, and the raw surfaces swabbed with 1 per cent. formalin. In advanced cases complicated with spontaneous fracture or with suppuration, amputation affords the best chance of recovery.

The lesions in the bones resulting from actinomycosis and from mycetoma, have been described with these diseases.

CONSTITUTIONAL DISEASES ATTENDED WITH LESIONS IN THE BONES

These include rickets, scurvy-rickets, osteomalacia, ostitis deformans, osteomyelitis fibrosa, fragilitas ossium, and diseases of the nervous system.

RICKETS

Rickets or rachitis is a constitutional disease associated with disturbance of nutrition, and attended with changes in the skeleton. The disease is most common and most severe among the children of the poorer classes in large cities, who are improperly fed and are brought up in unhealthy surroundings. There is evidence that the most important factors in the causation of rickets are ill-health of the mother during pregnancy, and the administration to the child after its birth of food which is defective in animal fat, proteids, and salts of lime, or which contains these in such a form that they are not readily assimilated. The occurrence of the disease is favoured, and its features are aggravated, by imperfect oxygenation of the blood as the result of a deficiency of fresh air and sunlight, want of exercise, and by other conditions which prevail in the slums of large towns.

Pathological Anatomy.--The most striking feature is the softness (malacia) of the bones, due to excessive absorption of osseous tissue, and the formation of an imperfectly calcified tissue at the sites of ossification. The affected bones lose their rigidity, so that they are bent under the weight of the body, by the traction of muscles, and by other mechanical forces.

The periosteum is thick and vascular, and when detached carries with it plates and spicules of soft porous bone. The new bone may be so abundant that it forms a thick crust on the surface, and in the flat

bones of the skull this may be heaped up in the form of bosses or ridges resembling those ascribed to inherited syphilis.

In the epiphysial cartilages and at the ossifying junctions, all the processes concerned in ossification, excepting the deposition of lime salts, occur to an exaggerated degree. The cartilage of the epiphysial disc proliferates actively and irregularly, so that it becomes softer, thicker, and wider, and gives rise to a visible swelling, best seen at the lower end of the radius and lower end of the tibia, and at the costo-chondral junctions where the series of beaded swellings is known as the "rickety rosary."

The ossifying zone is increased in depth; the marrow is abnormally vascular; and the new bone that is formed is imperfectly calcified. The result is that the bones may never attain their normal length, and they remain stunted throughout life as in rickety dwarfs (Fig. 133), or the shafts may grow unequally and come to deviate from their normal axes as in knock-knee and bow-knee.

[Illustration: FIG. 133.--Skeleton of Ricketty Dwarf, known as "Bowed Joseph," leader of the Meal Riots in Edinburgh, who died in 1780.

(Anatomical Museum, University of Edinburgh.)]

These changes are well brought out in skiagrams; instead of the well-defined narrow line which represents the epiphysial cartilage, there is an ill-defined, blurred zone of considerable depth.

In the shafts of the long bones, owing to the excessive absorption of bone, the cortex becomes porous, the spongy bone is rarefied, and the bones readily bend or break under mechanical influences. When the disease is arrested, a process of repair sets in which often results in the bones becoming denser and heavier than normal. In the flat bones of the skull, the absorption may result in the entire disappearance of areas of bone, leaving a membrane which dimples like thin cardboard under the pressure of the finger--a condition known as craniotabes.

Changes in the Skeleton before the Child is able to walk.--The fontanelles remain open until the end of the second year or longer, and the frontal and parietal eminences are unduly prominent. There is sometimes hydrocephalus, and the head is characteristically enlarged. The jaws are altered so that while the upper jaw is contracted into the shape of a #V#, the lower jaw is square instead of rounded in outline, and the teeth do not oppose one another. In the thorax, the chief feature may be the beading at the costo-chondral junctions, principally of the fifth and sixth ribs or its walls may be contracted, particularly if respiration is interfered with as a result of bronchial catarrh or adenoids. The contraction may take the form of a vertical groove on each side, or of a horizontal groove at the level of the upper end of the xiphio-sternum; when the sternum and cartilages form a projection in front, the deformity is known as "pigeon-breast."

The spine may be curved backwards--kyphosis--throughout its whole extent or only in one part; or it may be curved to one side--scoliosis.

In the limbs, the prominent features are the deficient growth in length of the long bones, the enlargements at the epiphysial junctions, and the bending, and occasional greenstick fracture, of the shafts. The degree of enlargement of the epiphysial junctions is directly proportionate to the amount of movement to which the bone is subjected (John Thomson). The curves at this stage depend on the attitude of the child while sitting or being carried--for example, the arm bones become bent in children who paddle about the floor with the aid of their arms; and in a child who lies on its back with the lower limbs everted, the weight of the limb may lead to curvature of the neck of the femur--coxa vara. The clavicle or humerus may sustain greenstick fracture from the child being lifted by the arms; the femur, by a fall. From the extreme laxity of the ligaments, the joints can be moved beyond the normal limits, and the child is often observed to twist its limbs into abnormal

attitudes.

In Children who have walked.--In these children the most important deformities occur in the spine, pelvis, and lower extremities, and result for the most part from yielding of the softened bones under the weight of the body. Scoliosis is the usual type of spinal curvature, and in extreme cases it may lead to a pronounced form of hump-back. The pelvis may remain small (justo-minor pelvis), or it may be contracted in the sagittal plane (flat pelvis); when the bones are unusually soft, the acetabular portions are pushed inwards by the femora bearing the weight of the body, and the pelvis assumes the shape of a trefoil, as in the malacia of women. The shaft of the femur is curved forwards and laterally; the bones of the leg laterally as in bow-leg, or forwards, or forwards and laterally just above the ankle. The deformities at the knee (genu valgum, genu varum, and genu recurvatum), and at the hip (coxa vara), will be described in the volume dealing with the Extremities.

The majority of cases seen in surgical practice suffer from the deformities resulting from rickets rather than from the active disease. The examination of a large series of children at different ages shows that the deformities become less and less frequent with each year. Those who recover may ultimately show no trace of rickets, and this is especially true of children who grow at the average rate; in those, however, in whom growth is retarded, especially from the fifth to the seventh year, the deformities are apt to be permanent. It may be noted that the scoliosis due to rickets has little tendency towards recovery.

Treatment.--The treatment of the disease consists in regulating the diet, improving the surroundings, and preventing deformity. Phosphorus in doses of 100th grain may be given dissolved in cod-liver oil, and preparations of iron and lime may be added with advantage. To avoid those postures which predispose to deformities, the child should lie as much as possible. In the well-to-do classes this is readily accomplished by the aid of a nurse and the use of a perambulator. In hospital out-patients the child is kept off its feet by the use of a light wooden splint applied to the lateral aspect of each lower extremity, and extending from the pelvis to 6 inches beyond the sole.

When deformities are already present, the treatment depends upon whether or not there is any prospect of the bone straightening naturally. Under five years of age this may, as a rule, be confidently expected; the child should be kept off its feet, and the limbs bathed and massaged. In children of five or six and upwards, the prospect of natural straightening is a diminishing one, and it is more satisfactory to correct the deformity by operation. In rickety curvature of the spine, the child should lie on a firm mattress, or, to allow of its being taken into the open air, upon a double Thomas' splint extending from the occiput to the heels; the muscles acting on the trunk should be braced up by massage and appropriate exercises.

#Late Rickets# or #Rachitis Adolescentium# is met with at any age from nine to seventeen, and is generally believed to be due to a recrudescence of rickets which had been present in childhood. The disease is not attended with any disturbance of the general health; the pathological changes are the same as in infantile rickets, but are for the most part confined to the ossifying junctions, especially those which are most active during adolescence, for example at the knee-joint. The patient is easily tired, complains of pain in the bones, and, unless care is taken, deformity is liable to ensue. There can be no doubt that adolescent rickets plays an important part in the production of the deformities which occur at or near puberty, especially knock-knee and bow-knee.

#Scurvy-Rickets# or #Infantile Scurvy#.--This disease, described by Barlow and Cheadle, is met with in infants under two years who have been brought up upon sterilised or condensed milk and other proprietary foods, and is most common in the well-to-do classes. The haemorrhages, which are so characteristic of the disease, are usually preceded for some weeks by a cachectic condition, with listlessness and debility and

disinclination for movement. Very commonly the child ceases to move one of his lower limbs--pseudo-paralysis--and screams if it is touched; a swelling is found over one of the bones, usually the femur, accompanied by exquisite tenderness; the skin is tense and shiny, and there may be some oedema. These symptoms are due to a sub-periosteal haemorrhage, and associated with this there may be crepitus from separation of an epiphysis, rarely from fracture of the shaft of the bone. X-ray photographs show enlargement of the bone, the periosteum being raised from the shaft and new bone formed in relation to it. Haemorrhages also occur into the skin, presenting the appearance of bruises, into the orbit and conjunctiva, and from the mucous membranes.

The treatment consists in correcting the errors in diet. The infant should have a wet nurse or a plentiful supply of cow's milk in its natural state. Anti-scorbutics in the form of orange, lemon, or grape juice, and of potatoes bruised down in milk, may be given.

#Osteomalacia.--The term osteomalacia includes a group of conditions, closely allied to rickets, in which the bones of adults become soft and yielding, so that they are unduly liable to bend or break.

One form occurs in pregnant and puerperal women, affecting most commonly the pelvis and lumbar vertebrae, but sometimes the entire skeleton. The lime salts are absorbed, the bones lose their rigidity and bend under the weight of the body and other mechanical influences, with the result that gross deformities are produced, particularly in the pelvis, the lumbar spine, and the hip-joints.

Neuropathic forms occur in certain chronic diseases of the brain and cord; in some cases the bones lose their lime salts and bend, in others they become brittle.

Osteomalacia associated with New Growths in the Skeleton.--When secondary cancer is widely distributed throughout the skeleton, it is associated with softening of the bones, as a result of which they readily bend or break, and after death are easily cut with a knife. In the disease known as multiple myeloma, the interior of the ribs, sternum, and bodies of the vertebrae is occupied by a reddish gelatinous pulp, the structure of which resembles sarcoma; the bones are reduced to a mere shell, and may break on the slightest pressure; the urine contains albumose, a substance resembling albumen but coagulating at a comparatively low temperature (140° F.), and the coagulum is re-dissolved on boiling, and it is readily precipitated by hydrochloric acid (Bence-Jones).

#Ostitis Deformans--Paget's Disease of Bone.--This rare disease was first described by Sir James Paget in 1877. In the early stages, the marrow is transformed into a vascular connective tissue; its bone-eating functions are exaggerated, and the framework of the bone becomes rarefied, so that it bends under pressure as in osteomalacia. In course of time, however, new bone is formed in great abundance; it is at first devoid of lime salts, but later becomes calcified, so that the bones regain their rigidity. This formation of new bone is much in excess of the normal, the bones become large and bulky, their surfaces rough and uneven, their texture sclerosed in parts, and the medullary canal is frequently obliterated. These changes are well brought out in X-ray photographs. The curving of the long bones, which is such a striking feature of the disease, may be associated with actual lengthening, and the changes are sometimes remarkably symmetrical (Fig. 135). The bones forming the cranium may be enormously thickened, the sutures are obliterated, the distinction into tables and diploe is lost, and, while the general texture is finely porous, there may be areas as dense as ivory (Fig. 134).

[Illustration: FIG. 134.--Changes in the Skull resulting from Ostitis Deformans.]

(Anatomical Museum, University of Edinburgh.)]

Clinical Features.--The disease is usually met with in persons over

fifty years of age. It is insidious in its onset, and, the patient's attention may be first attracted by the occurrence of vague pains in the back or limbs; by the enlargement and bending of such bones as the tibia or femur; or by a gradual increase in the size of the head, necessitating the wearing of larger hats. When the condition is fully developed, the attitude and general appearance are eminently characteristic. The height is diminished, and, owing to the curving of the lower limbs and spine, the arms appear unnaturally long; the head and upper part of the spine are bent forwards; the legs are held apart, slightly flexed at the knees, and are rotated out as well as curved; the whole appearance suggests that of one of the large anthropoid apes. The muscles of the limbs may waste to such an extent as to leave the large, curved, misshapen bones covered only by the skin (Fig. 135). In the majority of cases the bones of the lower extremities are much earlier and more severely affected than those of the upper extremity, but the capacity of walking is usually maintained even in the presence of great deformity. In a case observed by Byrom Bramwell, the patient suffered from a succession of fractures over a period of years.

[Illustration: FIG. 135.--Cadaver, illustrating the alterations in the Lower Limbs resulting from Ostitis Deformans.]

The disease may last for an indefinite period, the general health remaining long unaffected. In a considerable number of the recorded cases one of the bones became the seat of sarcoma.

#Osteomyelitis Fibrosa.#--This comparatively rare disease, which was first described by Recklinghausen, presents many interesting features. Because of its causing deformities of the bones and an undue liability to fracture, and being chiefly met with in adolescents, it is regarded by some authors as a juvenile form of Paget's disease. It may be diffused throughout the skeleton--we have seen it in the skull and in the bones of the extremities--or it may be confined to a single bone, usually the femur, or, what is more remarkable, the condition may affect a portion only of the shaft of a long bone and be sharply defined from the normal bone in contact with it.

[Illustration: FIG. 136.--Osteomyelitis Fibrosa affecting Femora in a man aet. 19. The curving of the bones is due to multiple fractures.]

On longitudinal section of a long bone during the active stage of the disease, the marrow is seen to be replaced by a vascular young connective tissue which encroaches on the surrounding spongy bone, reducing it to the slenderest proportions; the formation of bone from the periosteum does not keep pace with the absorption and replacement going on in the interior, and the cortex may be reduced to a thin shell of imperfectly calcified bone which can be cut with a knife. The young connective tissue which replaces the marrow is not unlike that seen in osteomalacia; it is highly vascular and may show haemorrhages of various date; there are abundant giant cells of the myeloma type, and degeneration and liquefaction of tissue may result in the formation of cysts, which, when they constitute a prominent feature, are responsible for the name--osteomyelitis fibrosa cystica--sometimes applied to the condition.

It would appear that most of the recorded cases of cysts of bone owe their origin to this disease, while the abundance of giant cells with occasional islands of cartilage in the wall of such cysts is responsible for the view formerly held that they owed their origin to the liquefaction of a solid tumour, such as a myeloma, a chondroma, or even a sarcoma. Although the tissue elements in this disease resemble those of a new growth arising in the marrow, they differ in their arrangement and in their method of growth; there is no tendency to erupt through the cortex of the bone, to invade the soft parts, or to give rise to secondary growths.

Clinical Features.--The onset of the disease is insidious, and attention is usually first directed to it by the occurrence of fracture of the shaft of one of the long bones--usually the femur--from violence that would be insufficient to break a healthy bone. Apart from fracture,

the great increase in the size of one of the long bones and its uneven contour are sufficiently remarkable to suggest examination with the X-rays, by means of which the condition is at once recognised. A systematic examination of the other long bones will often reveal the presence of the disease at a stage before the bone is altered externally.

Symmetrical bossing of the skull was present in the case shown in Figs. 136 and 137, and there were also scattered patches of brown pigmentation of the skin of the face, neck, and trunk, similar to those met with in generalised neuro-fibromatosis. Apart from fracture, the disease is recognised by the thickening and usually also by the curving of the shafts of the long bones. It is easy to understand the curvature of bones that have passed through a soft stage and also of those that have been broken and badly united, but it is difficult to account for the curvatures that have no such cause; for example, we have seen marked curve of the radius in a forearm of which the ulna was quite straight. The curvature probably resulted from exaggerated growth in length.

[Illustration: FIG. 137.--Radiogram of Upper End of Femur showing appearances in Osteomyelitis Fibrosa.]

The X-ray appearances vary with the stage of the malady, not estimated in time, for the condition is chronic and may become stationary, but according to whether it is progressive or undergoing repair. The shadow of the bone presents a poor contrast to the soft parts, and no trace of its original architecture; in extreme cases the shadow of the femur resembles an unevenly filled sausage (Fig. 137); there is no cortical layer, the interior shows no trabecular structure, and some of the many clear areas are probably cysts. The condition extends right up to the articular cartilage, or, in the case of adolescent bones, up to the epiphysial cartilage.

Prognosis.--The condition does not appear to affect the general health. The future is concerned with the local conditions, and, especially in the case of the femur, with its liability to fracture; so far as we know there is no time limit to this.

Treatment is confined to protecting the affected bone--usually the femur--from injury. Operative treatment may be required for lameness due to a badly united fracture.

#Neuropathic Atrophy of Bone.--The conditions included under this heading occur in association with diseases of the nervous system.

Most importance attaches to the fragility of the bones met with in general paralysis of the insane, locomotor ataxia, and other chronic diseases of the brain and spinal cord. The bones are liable to be fractured by forces which would be insufficient to break a healthy bone. In locomotor ataxia the fractures affect especially the bones of the lower extremity, and may occur before there are any definite nerve symptoms, but they are more often met with in the ataxic stage, when the abrupt and uncontrolled movements of the limbs may play a part in their causation. They may be unattended with pain, and may fail to unite; when repair does take place, it is sometimes attended with an excessive formation of callus. Joint lesions of the nature of Charcot's disease may occur simultaneously with the alterations in the bones. In syringomyelia pathological fracture is not so frequent as in locomotor ataxia; it is more likely to occur in the bones of the upper extremity, and especially in the humerus. In some cases of epilepsy the bones break when the patient falls in a fit, and there is usually an exaggerated amount of comminution.

In these affections the bones present no histological or chemical alterations, and the X-ray shadow does not differ from the normal. It is maintained, therefore, that the disposition to fracture does not depend upon a fragility of the bone, but on the loss of the muscular sense and of common sensation in the bones, as a result of which there is an inability properly to throw the muscles into action and dispose the

limbs so as to place them under the most favourable conditions to meet external violence.

#Osteogenesis Imperfecta#, #Fragilitas Ossium#, or #Congenital Osteopsathyrosis#.--These terms are used to describe a condition in which an undue fragility of the bones dates from intra-uterine life. It may occur in several members of the same family. In severe cases, intra-uterine fractures occur, and during parturition fresh fractures are almost sure to be produced, so that at birth there is a combination of recent fractures and old fractures united and partly united, with bendings and thickenings of the bones. Large areas of the cranial vault may remain membranous.

After birth the predisposition to fracture continues, the bones are easily broken, the fractures are attended with little or no pain, the crepitus is soft, and although union may take place, it may be delayed and be attended with excess of callus. Cases have been observed in which a child has sustained over a hundred fractures.

The bones show a feeble shadow with the X-rays, and appear thin and atrophied; the medullary canal is increased at the expense of the cortex.

In young infants in whom multiple fractures occur the prognosis as to life is unfavourable, and no satisfactory treatment of the disease has been formulated. If the patient survives, the tendency to fracture gradually disappears.

#Hypertrophic Pulmonary Osteo-Arthropathy.#--This condition, which was described by Marie in 1890, is secondary to disease in the chest, such as chronic phthisis, empyema, bronchiectasis, or sarcoma of the lung.

There is symmetrical enlargement and deformity of the hands and feet; the shafts of the bones are thickened, and the soft tissues of the terminal segments of the digits hypertrophied. The fingers come to resemble drum-sticks, and the thumb the clapper of a bell. The nails are convex, and incurved at their free ends, suggesting a resemblance to the beak of a parrot. There is also enlargement of the lower ends of the bones of the forearm and leg, and effusion into the wrist and ankle-joints. Skiagrams of the hands and feet show a deposit of new bone along the shafts of the phalanges.

TUMOURS OF BONE

New growths which originate in the skeleton are spoken of as primary tumours; those which invade the bones, either by metastasis from other parts of the body or by spread from adjacent tissues, as secondary. A tumour of bone may grow from the cellular elements of the periosteum, the marrow, or the epiphyseal cartilage.

Primary tumours are of the connective-tissue type, and are usually solitary, although certain forms, such as the chondroma, may be multiple from the outset.

Periosteal tumours are at first situated on one side of the bone, but as they grow they tend to surround it completely. Innocent periosteal tumours retain the outer fibrous layer as a capsule. Malignant tumours tend to perforate the periosteal capsule and invade the soft parts.

Central or medullary tumours as they increase in size replace the surrounding bone, and simultaneously new bone is formed on the surface; as this is in its turn absorbed, further bone is formed beneath the periosteum, so that in time the bone is increased in girth, and is said to be "expanded" by the growth in its interior.

#Primary Tumours--Osteoma.#--When the tumour projects from the surface of a bone it is called an exostosis. When growing from bones developed in membrane, such as the flat bones of the skull, it is usually dense like ivory, and the term ivory exostosis is employed. When derived

from hyaline cartilage--for example, at the ends of the long bones--it is known as a cartilaginous exostosis. This is invested with a cap of cartilage from which it continues to grow until the skeleton attains maturity.

An exostosis forms a rounded or mushroom-shaped tumour of limited size, which may be either sessile or pedunculated, and its surface is smooth or nodulated (Figs. 138 and 139). A cartilaginous exostosis in the vicinity of a joint may be invested with a synovial sac or bursa--the so-called exostosis bursata. The bursa may be derived from the synovial membrane of the adjacent joint with which its cavity sometimes communicates, or it may be of adventitious origin; when it is the seat of bursitis and becomes distended with fluid, it may mask the underlying exostosis, which then requires a radiogram for its demonstration.

[Illustration: FIG. 138.--Radiogram of Right Knee showing Multiple Exostoses.]

Clinically, the osteoma forms a hard, indolent tumour attached to a bone. The symptoms to which it gives rise depend on its situation. In the vicinity of a joint, it may interfere with movement; on the medial side of the knee it may incapacitate the patient from riding. When growing from the dorsum of the terminal phalanx of the great toe--subungual exostosis--it displaces the nail, and may project through its matrix at the point of the toe, while the soft parts over it may be ulcerated from pressure (Fig. 107). It incapacitates the patient from wearing a boot. When it presses on a nerve-trunk it causes pains and cramps. In the orbit it displaces the eyeball; in the nasal fossae and in the external auditory meatus it causes obstruction, which may be attended with ulceration and discharge. In the skull it may project from the outer table, forming a smooth rounded swelling, or it may project from the inner table and press upon the brain.

The diagnosis is to be made by the slow growth of the tumour, its hardness, and by the shadow which it presents with the X-rays (Fig. 138).

An osteoma which does not cause symptoms may be left alone, as it ceases to grow when the skeleton is mature and has no tendency to change its benign character. If causing symptoms, it is removed by dividing the neck or base of the tumour with a chisel, care being taken to remove the whole of the overlying cartilage. The dense varieties met with in the bones of the skull present greater difficulties; if it is necessary to remove them, the base or neck of the tumour is perforated in many directions with highly tempered drills rotated by some form of engine, and the division is completed with the chisel.

[Illustration: FIG. 139.--Multiple Exostoses of both limbs.

(Photograph lent by Sir George T. Beatson.)]

#Multiple Exostoses.#--This disease, which, by custom, is still placed in the category of tumours, is to be regarded as a disorder of growth, dating from intra-uterine life and probably due to a disturbance in the function of the glands of internal secretion, the thyroid being the one which is most likely to be at fault (Arthur Keith). The disorder of growth is confined to those elements of the skeleton where a core of bone formed in cartilage comes to be encased in a sheath of bone formed beneath the periosteum. To indicate this abnormality the name diaphysial aclasis has been employed by Arthur Keith at the suggestion of Morley Roberts.

Bones formed entirely in cartilage are exempt, namely, the tarsal and carpal bones, the epiphyses of the long bones, the sternum, and the bodies of the vertebrae. Bones formed entirely in membrane, that is, those of the face and of the cranial vault, are also exempt. The disorder mainly affects the ossifying junctions of the long bones of the extremities, the vertebral border of the scapula, and the cristal border of the ilium.

Clinically the disease is attended with the gradual and painless

development during childhood or adolescence of a number of tumours or irregular projections of bone, at the ends of the long bones, the vertebral border of the scapula, and the cristal border of the ilium. They exhibit a rough symmetry; they rarely attain any size; and they usually cease growing when the skeleton attains maturity--the conversion of cartilage into bone being then completed. While they originate from the ossifying junctions of the long bones, they tend, as the shaft increases in length, to project from the surface of the bone at some distance from the ossifying junction and to "point" away from it. They may cause symptoms by "locking" the adjacent joint or by pressing upon nerve-trunks or blood vessels.

In a considerable proportion of cases, the disturbance of growth is further manifested by dwarfing of the long bones; these are not only deficient in length but are sometimes also curved and misshapen, which accounts for the condition being occasionally confused with the disturbances of growth resulting from rickets. In about one-third of the recorded cases there is a dislocation of the head of the radius on one or on both sides, a result of unequal growth between the bones of the forearm.

[Illustration: FIG. 140.--Multiple Cartilaginous Exostoses in a man aet. 27. The scapular tumour projecting above the right clavicle has taken on active growth and pressed injuriously on the cords of the brachial plexus.]

In early adult life, one of the tumours, instead of undergoing ossification, may take on active growth and exhibit the features of a chondro-sarcoma, pressing injuriously upon adjacent structures (Fig. 140) and giving rise later to metastases in the lungs.

The X-ray appearances of the bones affected are of a striking character; apart from the outgrowths of bone or "tumours" there is evident a widespread alteration in the internal architecture of the bones, which suggests analogies with other disturbances of ossification such as achondroplasia and osteomyelitis fibrosa. The condition is one that runs in families, sometimes through several generations; we have more than once seen a father and son together in the hospital waiting-room.

As regards treatment, there is no indication for surgical interference except when one or other tumour is a source of disability as by pressing upon a nerve-trunk or by locking a joint, in which case it is easily removed by chiselling through its neck.

[Illustration: FIG. 141.--Multiple Cartilaginous Exostoses in a man aet. 27, the same as in Fig. 140.]

Diffuse Osteoma, Leontiasis Ossea.--This rare affection was described by Virchow, and named leontiasis ossea because of the disfigurement to which it gives rise. It usually commences in adolescence as a diffuse overgrowth first of one and then of both maxillae; these bones are enlarged in all directions and project on the face, and the nasal fossae and the maxillary and frontal sinuses become filled up with bone, which encroaches also on the orbital cavities. In addition to the hideous deformity, the patient suffers from blocking of the nose, loss of smell, and protrusion of the eyes, sometimes followed by loss of sight. The condition is liable to spread to the zygomatic and frontal bones, the vault of the skull, and to the mandible. The base of the skull is not affected. The disease is of slow progress and may become arrested; life may be prolonged for many years, or may be terminated by brain complications or by intercurrent affections. In certain cases it is possible to remove some of the more disfiguring of the bony masses.

A less aggressive form, confined to the maxilla on one side, is sometimes met with, and, in a case of this variety under our own observation, the disfigurement, which was the only subject of complaint, was removed, after reflecting the soft parts, by paring away the excess of bone; this is easily done as the bone is spongy, and at an early stage, imperfectly calcified.

A remarkable form of unilateral hypertrophy and diffuse osteoma of the skull, following the distribution of the fifth nerve, has been described by Jonathan Hutchinson and Alexis Thomson.

#Chondroma.---Cartilaginous tumours, apart from those giving rise to multiple exostoses, grow from the long bones and from the scapula, ilium, ribs, or jaws. They usually project from the surface of the bone, and may attain an enormous size; sometimes they grow in the interior of a bone, the so-called enchondroma.

The hyaline cartilage composing the tumour frequently undergoes myxomatous degeneration, resulting in the formation of a glairy, semi-fluid jelly, and if this change takes place throughout the tumour it comes to resemble a cyst. On the other hand, the cartilage may undergo calcification or ossification. The most important transition of all is that into sarcoma, the so-called malignant chondroma or chondro-sarcoma, which is associated with rapid increase in size, and parts of the tumour may be carried off in the blood-stream and give rise to secondary growths, especially in the lungs.

Cases have been met with in which certain parts of the skeleton--only those developed in cartilage--were so uniformly permeated with cartilage that the condition has been described as a "chondromatosis" and is regarded as dating from an early period of foetal life. Unlike the condition known as multiple cartilaginous exostoses, it is a malignant disease.

[Illustration: FIG. 142.--Multiple Chondromas of Phalanges and Metacarpals in a boy aet. 10 (cf. Fig. 143).]

The chondroma is met with as a slowly growing tumour which is specially common in the bones of the hand, often in a multiple form (Figs. 142 and 144). The surface is smooth or lobulated, and in consistence the tumour may be dense and elastic like normal cartilage, or may present areas of softening, or of bony hardness. The skin moves freely over it, except in relation to the bones of the fingers, where it may become adherent and ulcerate, simulating the appearance of a malignant tumour. Large tumours growing from the bones of the extremities may impinge the main vessels and nerves, either surrounding them or pressing on them.

Portions of a chondroma, which have undergone calcification or ossification, throw a dark shadow with the X-rays; unaltered cartilage and myxomatous tissue appear as clear areas.

[Illustration: FIG. 143.--Skiagram of Multiple Chondromas shown in Fig. 142.]

Treatment.--It is necessary to remove the whole tumour, and in chondromas growing from the surface of the bone, especially if they are pedunculated, this is comparatively easy. When a bone, such as the scapula or mandible, is involved, it is better to excise the bone, or at least the part of it which bears the tumour. In the case of central tumours the shell of bone is removed over an area sufficient to allow of the enucleation of the tumour, or the affected portion of bone is resected. Should there be evidence of malignancy, such as increased rate of growth, a tube of radium should be inserted, and in advanced cases with destruction of tissue, amputation may be called for.

[Illustration: FIG. 144.--Multiple Chondromas in Hand of boy aet. 8]

In multiple chondromas of the hand in young subjects, it was formerly the custom to amputate the limb; an attempt should be made to avoid this by shelling out the larger tumours individually, and persevering with the application of the X-rays or of radium to inhibit the growth of the smaller ones.

Chondromas springing from the pelvic bones usually arise in the region of the sacro-iliac joint; they project into the pelvis and press on the bladder and rectum, and on the sciatic and obturator nerves; sometimes

also on the iliac veins, causing oedema of the legs. They are liable to take on malignant characters, and rarely lend themselves to complete removal by operation.

#Fibroma# is met with chiefly as a periosteal growth in relation to the mouth and pharynx, the simple epulis of the alveolar margin and the nasopharyngeal polypus being the most common examples. We have met with a fibroma in the interior of the lower end of the femur of an adult, causing expansion of the bone with decided increase in girth and liability to pathological fracture; it is possible that this represents the cured stage of osteomyelitis fibrosa.

Myxoma, lipoma, and angioma of bone are all rare.

#Myeloma.#--The myeloid tumour, which is sometimes classified with the sarcomas, contains as its chief elements large giant cells, like those normally present in the marrow. On section these tumours present a brownish-red or chocolate colour, and, being highly vascular, are liable to haemorrhages, and therefore also to pigmentation, and to the formation of blood cysts. Sometimes the arterial vessels are so dilated as to impart to the tumour an aneurysmal pulsation and bruit. The enlargement or "expansion" of the bone results in the cortex being represented by a thin shell of bone, which may crackle on pressure--parchment or egg-shell crackling.

The myeloma is most often met with between the ages of twenty-five and forty in the upper end of the tibia or lower end of the femur. It grows slowly and causes little pain, and may long escape recognition unless an examination is made with the X-rays. Although these tumours have been known to give rise to metastases, they are, as a rule, innocent and are to be treated as such. When located in the shaft of a long bone, pathological fracture is liable to occur.

Diagnosis and X-ray Appearances of Myeloma.--The early diagnosis of myeloma is made with the aid of the X-rays: the typical appearance is that of a rounded or oval clear area bounded by a shell of bone of diminishing thickness (Fig. 145). The inflammatory lesions at the ends of the long bones--tubercle, syphilitic gumma, and Brodie's abscess, that resemble myeloma, are all attended with the formation of new bone in greater or lesser amount. The myeloma is also to be diagnosed from chondroma, from sarcoma, and from osteomyelitis fibrosa cystica.

[Illustration: FIG. 145.--Radiogram of Myeloma of Humerus.

(Mr. J. W. Struthers' case.)]

Treatment.--In early cases the cortex is opened up to give free access to the tumour tissue, which is scraped out with the spoon. Bloodgood advises the use of Esmarch's tourniquet, and that the curetting be followed by painting with pure carbolic acid and then rinsing with alcohol; a rod of bone is inserted to fill the gap. In advanced cases the segment of bone is resected and a portion of the tibia or fibula from the other limb inserted into the gap; a tube of radium should also be introduced.

The coexistence of diffuse myelomatosis of the skeleton and albumosuria (Bence-Jones) is referred to on p. 474. Myeloma occurs in the jaws, taking origin in the marrow or from the periosteum of the alveolar process, and is described elsewhere.

#Sarcoma# and #endothelioma# are the commonest tumours of bone, and present wide variations in structure and in clinical features. Structurally, two main groups may be differentiated: (1) the soft, rapidly growing cellular tumours, and (2) those containing fully formed fibrous tissue, cartilage, or bone.

(1) The soft cellular tumours are composed mainly of spindle or round cells; they grow from the marrow of the spongy ends or from the periosteum of the long bones, the diploe of the skull, the pelvis, vertebrae, and jaws. As they grow they may cause little alteration in the

contour of the bone, but they eat away its framework and replace it, so that the continuity of the bone is maintained only by tumour tissue, and pathological fracture is a frequent result. The small round-celled sarcomas are among the most malignant tumours of bone, growing with great rapidity, and at an early stage giving rise to secondary growths.

(2) The second group includes the fibro-, oste-, and chondro-sarcomas, and combinations of these; in all of them fully formed tissues or attempts at fully formed tissues predominate over the cellular elements. They grow chiefly from the deeper layer of the periosteum, and at first form a projection on the surface, but later tend to surround the bone (Fig. 150), and to invade its interior, filling up the marrow spaces with a white, bone-like substance; in the flat bones of the skull they may traverse the diploe and erupt on the inner table. The tumour tissue next the shaft consists of a dense, white, homogeneous material, from which there radiate into the softer parts of the tumour, spicules, needles, and plates, often exhibiting a fan-like arrangement (Fig. 151). The peripheral portion consists of soft sarcomatous tissue, which invades the overlying soft parts. The articular cartilage long resists destruction. The ossifying sarcoma is met with most often in the femur and tibia, less frequently in the humerus, skull, pelvis, and jaws. In the long bones it may grow from the shaft, while the chondro-sarcoma more often originates at the extremities. Sometimes they are multiple, several tumours appearing simultaneously or one after another. Secondary growths are met with chiefly in the lungs, metastasis taking place by way of the veins.

[Illustration: FIG. 146.--Periosteal Sarcoma of Femur in a young subject.]

[Illustration: FIG. 147.--Periosteal Sarcoma of Humerus, after maceration.

(Anatomical Museum, University of Edinburgh.)]

Clinical Features.--Sarcoma is usually met with before the age of thirty, and is comparatively common in children. Males suffer oftener than females, in the proportion of two to one.

In periosteal sarcoma the presence of a swelling is usually the first symptom; the tumour is fusiform, firm, and regular in outline, and when it occurs near the end of a long bone the limb frequently assumes a characteristic "leg of mutton" shape (Fig. 146). The surface may be uniform or bossed, the consistence varies at different parts, and the swelling gradually tapers off along the shaft. On firm pressure, fine crepitation may be felt from crushing of the delicate framework of new bone.

[Illustration: FIG. 148.--Chondro-Sarcoma of Scapula in a man aet. 63; removal of the scapula was followed two years later by metastases and death.]

In central sarcoma pain is the first symptom, and it is usually constant, dull, and aching; is not obviously increased by use of the limb, but is often worse at night. Swelling occurs late, and is due to expansion of the bone; it is fusiform or globular, and is at first densely hard, but in time there may be parchment-like or egg-shell crackling from yielding of the thin shell. The swelling may pulsate, and a bruit may be heard over it. In advanced cases it may be impossible to differentiate between a periosteal and a central tumour, either clinically or after the specimen has been laid open.

Pathological fracture is more common in central tumours, and sometimes is the first sign that calls attention to the condition. Consolidation rarely takes place, although there is often an attempt at union by the formation of cartilaginous callus.

[Illustration: FIG. 149.--Central Sarcoma of Lower End of Femur, invading the knee-joint.

(Museum of Royal College of Surgeons, Edinburgh.)]

[Illustration: FIG. 150.--Osseous Shell of Osteo-Sarcoma of Upper Third of Femur, after maceration.]

The soft parts over the tumour for a long time preserve their normal appearance; or they become oedematous, and the subcutaneous venous network is evident through the skin. Elevation of the temperature over the tumour, which may amount to two degrees or more, is a point of diagnostic significance, as it suggests an inflammatory lesion.

The adjacent joint usually remains intact, although its movements may be impaired by the bulk of the tumour or by effusion into the cavity.

Enlargement of the neighbouring lymph glands does not necessarily imply that they have become infected with sarcoma for the enlargement may disappear after removal of the primary growth; actual infection of the glands, however, does sometimes occur, and in them the histological structure of the parent tumour is reproduced.

To obtain a reasonable prospect of cure, the diagnosis must be made at an early stage. Great reliance is to be placed on information gained by examination with the X-rays.

[Illustration: FIG. 151.--Radiogram of Osteo-Sarcoma of Upper Third of Femur.]

X-ray Appearances.--In periosteal tumours that do not ossify, there is merely erosion of bone, and the shadow is not unlike that given by caries; in ossifying tumours, the arrangement of the new bone on the surface is characteristic, and when it takes the form of spicules at right angles to the shaft, it is pathognomonic.

In soft central tumours, there is disappearance of bone shadow in the area of the tumour, while above and below or around this, the shadow is that of normal bone right up to the clear area. In many respects the X-ray appearances resemble those of myeloma. In tumours in which there is a considerable amount of imperfectly formed new bone, this gives a shadow which barely replaces that of the original bone, in parts it may even add to it--the resulting picture differing widely in different cases; but it is usually possible to differentiate it from that caused by bacterial infections of the bone and from lesions of the adjacent joint.

[Illustration: FIG. 152.--Radiogram of Chondro-Sarcoma of Upper End of Humerus in a woman aet. 29.]

Skiagraphy is not only of assistance in differentiating new growths from other diseases of bone, but may also yield information as to the situation and nature of the tumour, which may have important bearings on its treatment by operation.

When fracture of a long bone takes place in an adolescent or young adult from comparatively slight violence, disease of the bone should be suspected and an X-ray examination made.

In difficult cases the final appeal is to exploratory incision and microscopical examination of a portion of the tumour; this should be done when the major operation has been arranged for, the surgeon waiting until the examination is completed.

The prognosis varies widely. In general, it may be said that periosteal tumours are less favourable than central ones, because they are more liable to give rise to metastases. Permanent cures are unfortunately the exception.

Treatment.--When one of the bones of a limb is involved, the usual practice has been to perform amputation well above the growth, and this may still be recommended as a routine procedure. There are reasons, however, which may be urged against its continuance. High amputation is

unnecessary in the more benign sarcomas, and in the more malignant forms is usually unavailing to prevent a fatal issue either from local recurrence or from metastases in the lungs or elsewhere. Following the lead of Mikulicz, a considerable number of permanent cures have been obtained by resecting the portion of bone which is the seat of the tumour, and substituting for it a corresponding portion from the tibia or fibula of the other limb. In a cellular sarcoma of the humerus of a boy we resected the shaft and inserted his fibula ten years ago, and he shows no sign of recurrence. When resection is impracticable, a subcapsular enucleation is performed, followed by the insertion of radium.

#Pulsating Haematoma# or #Aneurysm of Bone#.--A limited number of these are innocent cavernous tumours dating from a congenital angioma. The majority would appear to be the result of changes in a sarcoma, endothelioma, or myeloma. The tumour tissue largely disappears, while the vessels and vascular spaces undergo a remarkable development. The tumour may come to be represented by one large blood-containing space communicating with the arteries of the limb; the walls of the space consist of the remains of the original tumour, plus a shell of bone of varying thickness. The most common seats of the condition are the lower end of the femur, the upper end of the tibia, and the bones of the pelvis.

The clinical features are those of a pulsating tumour of slow development, and as in true aneurysm, the pulsation and bruit disappear on compression of the main artery. The origin of the tumour from bone may be revealed by the presence of egg-shell crackling, and by examination with the X-rays.

If the condition is believed to be innocent, the treatment is the same as for aneurysm--preferably by ligation of the main artery; if malignant, it is the same as for sarcoma.

#Secondary Tumours of Bone.#--These embrace two groups of new growth, those which give rise to secondary growths in the marrow of bones and those which spread to bone by direct continuity.

Metastatic Tumours.--Excepting certain cancers which give rise to metastases by lymphatic permeation (Handley), the common metastases arising in the bone-marrow reach their destination through the blood-stream.

[Illustration: FIG. 153.--Epitheliomatous Ulcer of Leg with direct extension to Tibia.

(Lord Lister's specimen. Anatomical Museum, University of Edinburgh.)]

Secondary cancer is a comparatively common disease, and, as in metastases in other tissues, the secondary growths resemble the parent tumour. The soft forms grow rapidly, and eat away the bone, without altering its shape or form. In slowly growing forms there may be considerable formation of imperfectly formed bone, often deficient in lime salts; this condition may be widely diffused throughout the skeleton, and, as it is associated with softening and bending of the bones, it is known as cancerous osteomalacia. Secondary cancer of bone is attended with pain, or it suddenly attracts notice by the occurrence of pathological fracture--as, for example, in the shaft of the femur or humerus. In the vertebrae, it is attended with a painful form of paraplegia, which may involve the lower or all four extremities. On the other hand, the disease may show itself clinically as a tumour of bone, which may attain a considerable size, and may be mistaken for a sarcoma, unless the existence of the primary cancer is discovered.

The cancers most liable to give rise to metastasis in bone are those of the breast, liver, uterus, prostate, colon, and rectum; hyper-nephroma of the kidney may also give rise to metastases in bone.

Secondary tumours derived from the thyroid gland require special mention, because they are peculiar in that neither the primary growth in

the thyroid nor the secondary growth in the bones is necessarily malignant. They are therefore amenable to operative treatment.

Secondary sarcoma, whether derived from a primary growth in the bone or in the soft parts, is much rarer than secondary cancer. Its removal by operation is usually contra-indicated, but we have known of cases terminating fatally in which the section revealed only one metastasis, the removal of which would have benefited the patient.

In all of these conditions, examination of the bones with the X-rays gives valuable information and often disclose unsuspected metastases.

Cancer of Bone resulting from Direct Extension from Soft Parts.--In this group there are also two clinical types. The first is met with in relation to epithelioma of a mucous surface--for example, the palate, tongue, gums, antrum, frontal sinus, auditory meatus, or middle ear. They will be described under these special regions.

The second type is met with in relation to epithelioma occurring in a sinus_, the sequel of suppurative osteomyelitis, compound fracture, or tuberculous disease. The patient has usually had a discharging sinus for a great number of years: we have known it to last as many as fifty. The epithelioma originates at the skin orifice of the sinus, and spreads to the bone and into its interior, where the progress of the cancer is resisted by dense bone, which obliterates the medullary canal. Although its progress is slow, the infiltration of the bone is usually more extensive than appears externally. It is recognised clinically by the characteristic cauliflower growth at the orifice of the sinus, and by the offensive nature of the discharge. A similar epithelioma may arise in connection with a chronic ulcer of the leg. The cancer may infect the femoral lymph glands. The operative treatment is influenced by the extent of the disease in the soft parts overlying the bone, and consists in wide removal of the diseased tissues and resection of the bone, or in amputation.

#Cysts of Bone.--With the exception of hydatid cysts, cysts in the interior of bone are the result of the liquefaction of solid tissue; this may be that of chondroma, myeloma, or sarcoma, but more commonly of the marrow in osteomyelitis fibrosa.

CHAPTER XXI

DISEASES OF JOINTS

Definition of terms--Ankylosis. DISEASES: Errors of development--Bacterial diseases: Pyogenic; Gonorrhoeal; Tuberculous; Syphilitic; Acute rheumatism--Diseases associated with certain constitutional conditions: Gout; Chronic articular rheumatism; Arthritis deformans; Haemophilia--Diseases associated with affections of the nervous system: Neuro-arthropathies; Charcot's disease--Hysterical or mimetic affections of joints--Tumours and cysts--Loose bodies.

#Definition of Terms.--The term synovitis is applied to any reaction which affects the synovial membrane of a joint. It is usually associated with effusion of fluid, and this may be serous, sero-fibrinous, or purulent. As the term synovitis merely refers to the tissue involved, it should always be used with an adjective--such as gouty, gonorrhoeal, or tuberculous--which indicates its pathological nature.

The terms hydrops, hydrarthrosis, and chronic serous synovitis are synonymous, and are employed when a serous effusion into the joint is the prominent clinical feature. Hydrops may occur apart from disease--for example, in the knee-joint from repeated sprains, or when there is a loose body in the joint--but is met with chiefly in the chronic forms of synovitis which result from gonorrhoea, tuberculosis,

syphilis, arthritis deformans, or arthropathies of nerve origin.

Arthritis is the term applied when not only the synovial membrane but the articular surfaces, and it may be also the ends of the bones, are involved, and it is necessary to prefix a qualifying adjective which indicates its nature. When effusion is present, it may be serous, as in arthritis deformans, or sero-fibrinous or purulent, as in certain forms of pyogenic and tuberculous arthritis. Wasting of the muscles, especially the extensors, in the vicinity of the joint is a constant accompaniment of arthritis. On account of the involvement of the articular surfaces, arthritis is apt to be followed by ankylosis.

The term empyema is sometimes employed to indicate that the cavity of the joint contains pus. This is observed chiefly in chronic disease of pyogenic or tuberculous origin, and is usually attended with the formation of abscesses outside the joint.

Ulceration of cartilage and caries of the articular surfaces are common accompaniments of the more serious and progressive forms of joint disease, especially those of bacterial origin. The destruction of cartilage may be secondary to disease of the synovial membrane or of the subjacent bone. When the disease begins as a synovitis, the synovial membrane spreads over the articular surface, fuses with the cartilage and eats into it, causing defects or holes which are spoken of as ulcers. When the disease begins in the bone, the marrow is converted into granulation tissue, which eats into the cartilage and separates it from the bone. Following on the destruction of the cartilage, the articular surface of the bone undergoes disintegration, a condition spoken of as caries of the articular surface. The occurrence of ulceration of cartilage and of articular caries is attended with the clinical signs of fixation of the joint from involuntary muscular contraction, wasting of muscles, and starting pains. These starting pains are the result of sudden involuntary movements of the joint. They occur most frequently as the patient is dropping off to sleep; the muscles becoming relaxed, the sensitive ulcerated surfaces jar on one another, which causes sudden reflex contraction of the muscles, and the resulting movement being attended with severe pain, wakes the patient with a start. Advanced articular caries is usually associated with some abnormal attitude and with shortening of the limb. It may be possible to feel the bony surfaces grate upon one another. When all its constituent elements are damaged or destroyed, a joint is said to be disorganised. Should recovery take place, repair is usually attended with union of the opposing articular surfaces either by fibrous tissue or by bone.

#Conditions of Impaired Mobility of Joints.--There are four conditions of impaired mobility in joints: rigidity, contracture, ankylosis, and locking. Rigidity is the fixation of a joint by involuntary contraction of muscles, and is of value as a sign of disease in deep-seated joints, such as the hip. It disappears under anaesthesia.

Contracture is the term applied when the fixation is due to permanent shortening of the soft parts around a joint--muscles, tendons, ligaments, fasciae, or skin. As the structures on the flexor aspect are more liable to undergo such shortening, contracture is nearly always associated with flexion. Contracture may result from disease of the joint, or from conditions outside it--for example, disease in one of the adjacent bones, or lesions of the nerves.

Ankylosis is the term applied when impaired mobility results from changes involving the articular surfaces. It is frequently combined with contracture. Three anatomical varieties of ankylosis are recognised--(a) The fibrous, in which there are adhesions between the opposing surfaces, which may be in the form of loose isolated bands of fibrous tissue, or may bind the bones so closely together as to obliterate the cavity of the joint. The resulting stiffness, therefore, varies from a mere restriction of the normal range of movement, up to a close union of the bones which prevents movement. Fibrous ankylosis may follow upon injury, especially dislocation or fracture implicating a joint, or it may result from any form of arthritis. (b) Cartilaginous ankylosis implies the fusion of two apposed cartilaginous surfaces. It

is often found between the patella and the trochlear surface of the femur in tuberculous disease of the knee. The fusion of the cartilaginous surfaces is preceded by the spreading of a vascular connective tissue, derived from the synovial membrane, over the articular cartilage. Clinically, it is associated with absolute immobility, (c) Bony ankylosis or synostosis is an osseous union between articulating surfaces (Figs. 154 and 155). It may follow upon fibrous or cartilaginous ankylosis, or may result from the fusion of two articular surfaces which have lost their cartilage and become covered with granulations. In the majority of cases it is to be regarded as a reparative process, presenting analogies with the union of fracture.

[Illustration: FIG. 154.--Osseous Ankylosis of Femur and Tibia in position of flexion.]

The term arthritis ossificans has been applied by Joseph Griffiths to a condition in which the articular surfaces become fused without evident cause.

The occurrence of ankylosis in a joint before the skeleton has attained maturity does not appear to impair the growth in length of the bones affected; ankylosis of the temporo-maxillary joints, however, greatly impairs the growth of the mandible. When there is arrest of growth accompanying ankylosis, it usually depends on changes in the ossifying junctions caused by the original disease.

To differentiate by manipulation between muscular fixation and ankylosis, it may be necessary to anaesthetise the patient. The nature and extent of ankylosis may be learned by skiagraphy; in osseous ankylosis the shadow of the two bones is a continuous one. In fibrous as contrasted with osseous ankylosis mobility may be elicited, although only to a limited extent; while in osseous ankylosis the joint is rigidly fixed, and attempts to move it are painless.

[Illustration: FIG. 155.--Osseous Ankylosis of Knee in the flexed position following upon Tuberculous Arthritis.

(Anatomical Museum, University of Edinburgh.)]

The treatment is influenced by the nature of the original lesion, the variety of the ankylosis, and the attitude of the joint. When there is restriction of movement due to fibrous adhesions, these may be elongated or ruptured. Elongation of the adhesions may be effected by manipulations, exercises, and the use of special forms of apparatus--such as the application of weights to the limb. It may be necessary to administer an anaesthetic before rupturing strong fibrous adhesions, and this procedure must be carried out with caution, in view of such risks as fracture of the bone--which is often rarefied--or separation of an epiphysis. There is also the risk of fat embolism, and of re-starting the original disease. The giving way of adhesions may be attended with an audible crack; and the procedure is often followed by considerable pain and effusion into the joint, which necessitate rest for some days before exercises and manipulations can be resumed.

Operative treatment may be called for in cases in which the bones are closely bound to one another by fibrous or by osseous tissue.

Arthrolysis, which consists in opening the joint and dividing the fibrous adhesions, is almost inevitably followed by their reunion.

Arthroplasty.--Murphy of Chicago devised this operation for restoring movement to an ankylosed joint. It consists in transplanting between the bones a flap of fat-bearing tissue, from which a bursal cavity lined with endothelium and containing a fluid rich in mucin is ultimately formed.

Arthroplasty is most successful in ankylosis following upon injury; when the ankylosis results from some infective condition such as tuberculosis or gonorrhoea, it is liable to result in failure either because of a fresh outbreak of the infection or because the ankylosis recurs.

When arthroplasty is impracticable, and a movable joint is desired--for example at the elbow--a considerable amount of bone, and it may be also of periosteum and capsular ligament, is resected to allow of the formation of a false joint.

When bony ankylosis has occurred with the joint in an undesirable attitude--for example flexion at the hip or knee--it can sometimes be remedied by osteotomy or by a wedge-shaped resection of the bone, with or without such additional division of the contracted soft parts as will permit of the limb being placed in the attitude desired.

Bony ankylosis of the joints of a finger, whether the result of injury or disease, is difficult to remedy by any operative procedure, for while it is possible to restore mobility, the new joint is apt to be flail-like.

Locking.--A joint is said to lock when its movements are abruptly arrested by the coming together of bony outgrowths around the joint. It is best illustrated in arthritis deformans of the hip in which new bone formed round the rim of the acetabulum mechanically arrests the excursions of the head of the femur. The new bone, which limits the movements, is readily demonstrated in skiagrams; it may be removed by operative means. Locking of joints is more often met with as a result of injuries, especially in fractures occurring in the region of the elbow. In certain injuries of the semilunar menisci of the knee, also, the joint is liable to a variety of locking, which differs, however, in many respects from that described above.

#Errors of Development.#--These include congenital dislocations and other deformities of intra-uterine origin, such as abnormal laxity of joints, absence, displacement, or defective growth of one or other of the essential constituents of a joint. The more important of these are described along with the surgery of the Extremities.

DISEASES OF JOINTS

#Bacterial Diseases.#--In most bacterial diseases the organisms are carried to the joint in the blood-stream, and they lodge either in the synovial membrane or in one of the bones, whence the disease subsequently spreads to the other structures of the joint. Organisms may also be introduced through accidental wounds. It has been shown experimentally that joints are among the most susceptible parts of the body to infection, and this would appear to be due to the viscous character of the synovial fluid, which protects organisms from bactericidal agents in the tissues and fluids.

PYOGENIC DISEASES

The commoner pyogenic diseases are the result of infection of one or other of the joint structures with staphylococci or streptococci, which may be demonstrated in the exudate in the joint and in the substance of the synovial membrane. The mode of infection is the same as in the pyogenic diseases of bone, the metastasis occurring most frequently from the mucous membrane of the pharynx (J. B. Murphy). The localisation of the infection in a particular joint is determined by injury, exposure to cold, antecedent disease of the joint, or other factors, the nature of which is not always apparent.

The effects on the joint vary in severity. In the milder forms, there is engorgement and infiltration of the synovial membrane, and an effusion into the cavity of the joint of serous fluid mixed with flakes of fibrin--serous synovitis. In more severe infections the exudate consists of pus mixed with fibrin, and, it may be, red blood corpuscles--purulent or suppurative synovitis; the synovial membrane and the ligaments are softened, and the surface of the membrane presents granulations resembling those on an ulcer; foci of suppuration may develop in the peri-articular cellular tissue and result in abscesses.

In acute arthritis, all the structures of the joint are involved; the articular cartilage is invaded by granulation tissue derived from the synovial membrane, and from the marrow of the subjacent bone; it presents a worm-eaten or ulcerated appearance, or it may undergo necrosis and separate, exposing the subjacent bone and leading to disintegration of the osseous trabeculae--caries. With the destruction of the ligaments, the stability of the joint is lost, and it becomes disorganised.

The clinical features vary with the extent of the infection. When this is confined to the synovial and peri-synovial tissues--acute serous and purulent synovitis--there is the usual general reaction, associated with pyrexia and great pain in the joint. The part is hot and swollen, the swelling assuming the shape of the distended synovial sac, fluctuation can usually be elicited, and the joint is held in the flexed position.

When the joint is infected by extension from the surrounding cellular tissue, the joint lesion may not be recognised at an early stage because of the swollen condition of the limb, and because there are already symptoms of toxæmia. We have observed a case in which both the hip and knee joints were infected from the cellular tissue.

If the infection involves all the joint structures--acute arthritis--the general and local phenomena are intensified, the temperature rises quickly, often with a rigor, and remains high; the patient looks ill, and is either unable to sleep or the sleep is disturbed by starting pains. The joint is held rigid in the flexed position, and the least attempt at movement causes severe pain; the slightest jar--even the shaking of the bed--may cause agony. The joint is hot, tensely distended, and there may be oedema of the peri-articular tissues or of the limb as a whole. If the pus perforates the joint capsule, there are signs of abscess or of diffuse suppuration in the cellular tissue. The final disorganisation of the joint is indicated by abnormal mobility and grating of the articular surfaces, or by spontaneous displacement of the bones, and this may amount to dislocation. In the acute arthritis of infants, the epiphysis concerned may be separated and displaced.

When the joint is infected through an external wound, the anatomical features are similar to those observed when the infection has reached the joint by the blood-stream, but the destructive changes tend to be more severe and are more likely to result in disorganisation.

The terminations vary with the gravity of the infection and with the stage at which treatment is instituted. In the milder forms recovery is the rule, with more or less complete restoration of function. In more severe forms the joint may be permanently damaged as a result of fibrous or bony ankylosis, or from displacement or dislocation. From changes in the peri-articular structures there may be contracture in an undesirable position, and in young subjects the growth of the limb may be interfered with. The persistence of sinuses is usually due to disease in one or other of the adjacent bones. In the most severe forms, and especially when several joints are involved, death may result from toxæmia.

The treatment is carried out on the same principles as in other pyogenic infections. The limb is immobilised in such an attitude that should stiffness occur there will be the least interference with function. Extension by weight and pulley is the most valuable means of allaying muscular spasm and relieving intra-articular tension and of counteracting the tendency to flexion; as much as 15 or 20 pounds may be required to relieve the pain.

The induction of hyperaemia is sometimes remarkably efficacious in relieving pain and in arresting the progress of the infection. If the fluid in the joint is in sufficient quantity to cause tension, if it persists, or if there is reason to suspect that it is purulent, it should be withdrawn without delay; an exploring syringe usually suffices, the skin being punctured with a tenotomy knife, and, as practised by Murphy, 5 to 15 c.c. of a 2 per cent. solution of formalin

in glycerin are injected and the wound is closed. In virulent infections the injection may be repeated in twenty-four hours. Drainage by tube or otherwise is to be condemned (Murphy). A vaccine may be prepared from the fluid in the joint and injected into the subcutaneous cellular tissue.

Suppuration in the peri-articular soft parts or in one of the adjacent bones must be looked for and dealt with.

When convalescence is established, attention is directed to the restoration of the functions of the limb, and to the prevention of stiffness and deformity by movements and massage, and the use of hot-air and other baths.

At a later stage, and especially in neglected cases, operative and other measures may be required for deformity or ankylosis.

#Metastatic Forms of Pyogenic Infection#

In #pyaemia#, one or more joints may fill with pus without marked symptoms or signs, and if the pus is aspirated without delay the joint often recovers without impairment of function.

In #typhoid fever#, joint lesions result from infection with the typhoid bacillus alone or along with pyogenic organisms, and run their course with or without suppuration; there is again a remarkable absence of symptoms, and attention may only be called to the condition by the occurrence of dislocation.

Joint lesions are comparatively common in #scarlet fever#, and were formerly described as scarlatinal rheumatism. The most frequent clinical type is that of a serous synovitis, occurring within a week or ten days from the onset of the fever. Its favourite seat is in the hand and wrist, the sheaths of the extensor tendons as well as the synovial membrane of the joints being involved. It does not tend to migrate to other joints, and rarely lasts longer than a few days. It is probably due to the specific virus of scarlet fever.

At a later stage, especially in children and in cases in which the throat lesion is severe, an arthritis is sometimes observed that is believed to be a metastasis from the throat; it may be acute and suppurative, affect several joints, and exhibit a septicaemic or pyaemic character.

The joints of the lower extremity are especially apt to suffer; the child is seriously ill, is delirious at night, develops bed-sores over the sacrum and, it may happen that, not being expected to recover, the legs are allowed to assume contracture deformities with ankylosis or dislocation at the hip and flexion ankylosis at the knees; should the child survive, the degree of crippling may be pitiable in the extreme; prolonged orthopaedic treatment and a series of operations--arthroplasty, osteotomies, and resections--may be required to restore even a limited capacity of locomotion.

#Pneumococcal affections of joints#, the result of infection with the pneumococcus of Fraenkel, are being met with in increasing numbers. The local lesion varies from a _synovitis_ with infiltration of the synovial membrane and effusion of serum or pus, to an _acute arthritis_ with erosion of cartilage, caries of the articular surfaces, and disorganisation of the joint. The knee is most frequently affected, but several joints may suffer at the same time. In most cases the joint affection makes its appearance a few days after the commencement of a pneumonia, but in a number of instances, especially among children, the lung is not specially involved, and the condition is an indication of a generalised pneumococcal infection, which may manifest itself by endocarditis, empyema, meningitis, or peritonitis, and frequently has a fatal termination. The differential diagnosis from other forms of pyogenic infection is established by bacteriological examination of the fluid withdrawn from the joint. The treatment is carried out on the same

lines as in other pyogenic infections, considerable reliance being placed on the use of autogenous vaccines.

In #measles#, #diphtheria#, #smallpox#, #influenza#, and #dysentery#, similar joint lesions may occur.

The joint lesions which accompany #acute rheumatism# or "rheumatic fever" are believed to be due to a diplococcus. In the course of a general illness in which there is moderate pyrexia and profuse sweating, some of the larger joints, and not infrequently the smaller ones also, become swollen and extremely sensitive, so that the sufferer lies in bed helpless, dreading the slightest movement. From day to day fresh joints are attacked, while those first affected subside, often with great rapidity. Affections of the heart-valves and of the pericardium are commonly present. On recovery from the acute illness, it may be found that the joints have entirely recovered, but in a small proportion of cases certain of them remain stiff and pass into the crippled condition described under chronic rheumatism. There is no call for operative interference.

#Gonococcal Affections of Joints.#--These include all forms of joint lesion occurring in association with gonorrhoeal urethritis, vulvo-vaginitis, or gonorrhoeal ophthalmia. They may develop at any stage of the urethritis, but are most frequently met with from the eighteenth to the twenty-second day after the primary infection, when the organisms have reached the posterior urethra; they have been observed, however, after the discharge has ceased. There is no connection between the severity of the gonorrhoea and the incidence of joint disease. In women, the gonorrhoeal nature of the discharge must be established by bacteriological examination.

As a complication of ophthalmia, the joint lesions are met with in infants, and occur more commonly towards the end of the second or during the third week.

The gonococcus is carried to the joint in the blood-stream and is first deposited in the synovial membrane, in the tissues of which it can usually be found; it may be impossible to find it in the exudate within the joint. The joint lesions may be the only evidence of metastasis, or they may be part of a general infection involving the endocardium, pleura, and tendon sheaths.

The joints most frequently affected are the knee, elbow, ankle, wrist, and fingers. Usually two or more joints are affected.

Several clinical types are differentiated. (1) A dry poly-arthritis met with in the joints and tendon sheaths of the wrist and hand, formerly described as gonorrhoeal rheumatism, which in some cases is trifling and evanescent, and in others is persistent and progressive, and results in stiffness of the affected joints and permanent crippling of the hand and fingers.

(2) The commonest type is a chronic synovitis or hydrops, in which the joint--very often the knee--becomes filled with a serous or sero-fibrinous exudate. There are no reactive changes in the synovial membrane, cellular tissue, or skin, nor is there any fever or disturbance of health. The movements are free except in so far as they are restricted by the amount of fluid in the joint. It usually subsides in two or three weeks under rest, but tends to relapse.

(3) An acute synovitis with peri-articular phlegmon is most often met with in the elbow, but it occurs also in the knee and ankle. There is a sudden onset of severe pain and swelling in and around the joint, with considerable fever and disturbance of health. The slightest movement causes pain, and the part is sensitive to touch. The skin is hot and tense, and in the case of the elbow may be red and fiery as in erysipelas.

The deposit of fibrin on the synovial membrane and on the articular surfaces may lead to the formation of adhesions, sometimes in the form

of isolated bands, sometimes in the form of a close fibrous union between the bones.

(4) A suppurative arthritis, like that caused by ordinary pus microbes, may be the result of gonococcal infection alone or of a mixed infection. Usually only one joint is affected, but the condition may be multiple. The articular cartilages are destroyed, the ends of the bones are covered with granulations, extra-articular abscesses form, and complete osseous ankylosis results.

The diagnosis is often missed because the possibility of gonorrhoea is not suspected.

The denial of the disease by the patient is not always to be relied upon, especially in the case of women, as they may be ignorant of its presence. The chief points in the differential diagnosis from acute articular rheumatism are, that the gonorrhoeal affection is more often confined to one or two joints, has little tendency to wander from joint to joint, and its progress is not appreciably influenced by salicylates, although these drugs may relieve pain. The conclusive point is the recognition of a gonorrhoeal discharge or of threads in the urine.

The disease may persist or may relapse, and the patient may be laid up for weeks or months, and may finally be crippled in one or in several joints.

The treatment--besides that of the urethral disease or of the ophthalmia--consists in rest until all pain and sensitiveness have disappeared. The pain is relieved by salicylates, but most benefit follows weight extension, the induction of hyperaemia by the rubber bandage and hot-air baths; if the joint is greatly distended, the fluid may be withdrawn by a needle and syringe. Detoxicated vaccines should be given from the first, and in afebrile cases the injection of a foreign protein, such as anti-typhoid vaccine, is beneficial (Harrison).

Murphy has found benefit from the introduction into the joint, in the early stages, of from 5 to 15 c.c. of a 2 per cent. solution of formalin in glycerin. This may be repeated within a week, the patient being kept in bed with light weight extension. In the chronic hydrops the fluid is withdrawn, and about an ounce of a 1 per cent. solution of protargol injected; the patient should be warned of the marked reaction which follows.

After all symptoms have settled down, but not till then, for fear of exciting relapse or metastasis, the joint is massaged and exercised. Stiffness from adhesions is most intractable, and may, in spite of every attention, terminate in ankylosis even in cases where there has been no suppuration. Forceful breaking down of adhesions under anaesthesia is not recommended, as it is followed by great suffering and the adhesions re-form. Operation for ankylosis--arthroplasty--should not be undertaken, as the ankylosis recurs.

TUBERCULOUS DISEASE

Tuberculous disease of joints results from bacillary infection through the arteries. The disease may commence in the synovial membrane or in the marrow of one of the adjacent bones, and the relative frequency of these two seats of infection has been the subject of considerable difference of opinion. The traditional view of Konig is that in the knee and most of the larger joints the disease arises in the bone and in the synovial membrane in about equal proportion, and that in the hip the number of cases beginning in the bones is about five times greater than that originating in the membrane. This estimate, so far as the actual frequency of bone lesions is concerned, has been generally accepted, but recent observers, notably John Fraser, do not accept the presence of bone lesions as necessarily proving that the disease commenced in the bones; he maintains, and we think with good grounds, that in many cases the disease having commenced in the synovial membrane, slowly spreads to the bone by way of the blood vessels and lymphatics, and gives rise to

lesions in the marrow.

#Morbid Anatomy.---Tuberculous disease in the articular end of a long bone may give rise to reactive changes in the adjacent joint, characterised by effusion and by the extension of the synovial membrane over the articular surfaces. This may result in the formation of adhesions which obliterate the cavity of the joint or divide it into compartments. These lesions are comparatively common, and are not necessarily due to actual tuberculous infection of the joint.

The infection of the joint by tubercle originating in the adjacent bone may take place at the periphery, the osseous focus reaching the surface of the bone at the site of reflection of the synovial membrane, and the infection which begins at this point then spreads to the rest of the membrane. Or it may take place in the central area, by the projection of tuberculous granulation tissue into the joint following upon erosion of the cartilage (Fig. 156).

[Illustration: FIG. 156.--Section of Upper End of Fibula, showing caseating focus in marrow, erupting on articular surface and infecting joint.]

Changes in the Synovial Membrane.--In the majority of cases there is a diffuse thickening of the synovial membrane, due to the formation of granulation tissue, or of young connective tissue, in its substance. This new tissue is arranged in two layers--the outer composed of fully formed connective or fibrous tissue, the inner of embryonic tissue, usually permeated with miliary tubercles. On opening the joint, these tubercles may be seen on the surface of the membrane, or the surface may be covered with a layer of fibrinous or caseating tissue. Where there is greater resistance on the part of the tissues, there is active formation of young connective tissue which circumscribes or encapsulates the tubercles, so that they remain embedded in the substance of the membrane, and are only seen on cutting into it.

The thickened synovial membrane is projected into the cavity of the joint, filling up its pouches and recesses, and spreading over the surface of the articular cartilage "like ivy growing on a wall." Wherever the synovial tissue covers the cartilage it becomes adherent to and fused with it. The morbid process may be arrested at this stage, and fibrous adhesions form between the opposing articular surfaces, or it may progress, in which case further changes occur, resulting in destruction of the articular cartilage and exposure of the subjacent bone.

In rare instances the synovial membrane presents nodular masses or lumps, resembling the tuberculous tumours met with in the brain; they project into the cavity of the joint, are often pedunculated, and may give rise to the symptoms of loose body. The fringes of synovial membrane may also undergo a remarkable development, like that observed in arthritis deformans, and described as arborescent lipoma. Both these types are almost exclusively met with in the knee.

The Contents of Tuberculous Joints.--In a large proportion of cases of synovial tuberculosis the joint is entirely filled up by the diffuse thickening of the synovial membrane. In a small number there is an abundant serous exudate, and with this there may be a considerable formation of fibrin, covering the surface of the membrane and floating in the fluid as flakes or masses; under the influence of movement it may assume the shape of melon-seed bodies. More rarely the joint contains pus, and the surface of the synovial membrane resembles the wall of a cold abscess.

Ulceration and Necrosis of Cartilage.--The synovial tissue covering the cartilage causes pitting and perforation of the cartilage and makes its way through it, and often spreads widely between it and the subjacent bone; the cartilage may be detached in portions of considerable size. It may be similarly ulcerated or detached as a result of disease in the bone.

Caries of Articular Surfaces.--Tuberculous infiltration of the marrow in the surface cancelli breaks up the spongy framework of the bone into minute irregular fragments, so that it disintegrates or crumbles away--caries. When there is an absence of caseation and suppuration, the condition is called caries sicca.

The pressure of the articular surfaces against one another favours the progress of ulceration of cartilage and of articular caries. These processes are usually more advanced in the areas most exposed to pressure--for example, in the hip-joint, on the superior aspect of the head of the femur, and on the posterior and upper segment of the acetabulum.

The occurrence of pathological dislocation is due to softening and stretching of the ligaments which normally retain the bones in position, and to some factor causing displacement, which may be the accumulation of fluid or of granulations in the joint, the involuntary contraction of muscles, or some movement or twist of the limb. The occurrence of dislocation is also favoured by destructive changes in the bones.

Peri-articular tubercle and abscess may result from the spread of disease from the bone or joint into the surrounding tissues, either directly or by way of the lymphatics. A peri-articular abscess may spread in several directions, sometimes invading tendon sheaths or bursae, and finally reaching the skin surface by tortuous sinuses.

Reactive changes in the vicinity of tuberculous joints are of common occurrence, and play a considerable part in the production of what is clinically known as white swelling. New connective tissue forms in the peri-articular fat and between muscles and tendons. It may be tough and fibrous, or soft, vascular, and oedematous, and the peri-articular fat becomes swollen and gelatinous, constituting a layer of considerable thickness. The fat disappears and is replaced by a mucoid effusion between the fibrous bundles of connective tissue. This is what was formerly known as gelatinous degeneration of the synovial membrane. In the case of the wrist the newly formed connective tissue may fix the tendons in their sheaths, interfering with the movements of the fingers. In relation to the bones also there may be reactive changes, resulting in the formation of spicules of new bone on the periosteal surfaces and at the attachment of the capsular and other ligaments; these are only met with where pyogenic infection has been superadded.

Terminations and Sequelae.--A natural process of cure may occur at any stage, the tuberculous tissue being replaced by scar tissue. Recovery is apt to be attended with impairment of movement due to adhesions, ankylosis, or contracture of the peri-articular structures. Caseous foci in the interior of the bones may become encapsulated, and a cure be thus effected, or they may be the cause of a relapse of the disease at a later date. Interference with growth is comparatively common, and may involve only the epiphyseal junctions in the immediate vicinity of the joint affected, or those of all the bones of the limb. This is well seen in adults who have suffered from severe disease of the hip in childhood--the entire limb, including the foot, being shorter and smaller than the corresponding parts of the opposite side.

Atrophic conditions are also met with, the bones undergoing fatty atrophy, so that in extreme cases they may be cut with a knife or be easily fractured. These atrophic conditions are most marked in bedridden patients, and are largely due to disuse of the limb; they are recovered from if it is able to resume its functions.

#Clinical Features.#--These vary with the different anatomical forms of the disease, and with the joint affected.

Sometimes the disease is ushered in by a febrile attack attended with pains in several joints--described by John Duncan as tuberculous arthritic fever. This is liable to be mistaken for rheumatic fever, from which, however, it differs in that there is no real migration from joint to joint; there is an absence of sweating and of cardiac complications; and no benefit follows the administration of salicylates.

In exceptional cases, tuberculous joint disease follows an acute course resembling that of the pyogenic arthritis of infants. This has been observed in children, especially in the knee, the lesion being in the synovial membrane, and attended with an accumulation of pus in the joint. If promptly treated by incision and drainage, recovery is rapid, and free movement of the joint, may be preserved.

The onset and early stages of tuberculous disease, however, are more often insidious, and are attended with so few symptoms that the disease may have obtained a considerable hold before it attracts notice. It is not uncommon for patients or their friends to attribute the condition to injury, as it often first attracts attention after some slight trauma or excessive use of the limb. The symptoms usually subside under rest, only to relapse again with use of the limb.

The initial local symptoms may be due to the presence of a focus in the neighbouring bone, perhaps causing neuralgic pains in the joint, or weakness, tiredness, stiffness, and inability to use the limb, these symptoms improving with rest and being aggravated by exertion.

It is rarely possible by external examination to recognise deep-seated osseous foci in the vicinity of joints; but if they are near the surface in a superficial bone--such as the head of the tibia--there may be local thickening of the periosteum, oedema, pain, and tenderness on pressure and on percussion.

X-ray Appearances of Tuberculous Joints.--Gross lesions such as caseous foci in the marrow of the adjacent bone show as clear areas with an ill-defined margin; a sclerosed focus gives a denser shadow than the surrounding bone, and a sequestrum presents a dark shadow of irregular contour, and a clear interval between it and the surrounding bone.

Caries of the articular surface imparts a woolly appearance or irregular contour in place of the well-defined outline of the articular end of the bone. In bony ankylosis the shadow of the two bones is a continuous one, the joint interval having been filled up. The minor changes are best appreciated on comparison with the normal joint of the other limb.

Wasting of muscles is a constant accompaniment of tuberculous joint disease. It is to be attributed partly to want of use, but chiefly to reflex interference with the trophic innervation of the muscles. It is specially well seen in the extensor and adductor muscles of the thigh in disease of the knee, and in the deltoid in disease of the shoulder. The muscles become soft and flaccid, they exhibit tremors on attempted movement, and their excitability to the faradic current is diminished. The muscular tissue may be largely replaced by fat.

Impairment of the normal movements is one of the most valuable diagnostic signs, particularly in deeply seated joints such as the shoulder, hip, and spine. It is due to a protective contraction of the muscles around the joint, designed to prevent movement. This muscular fixation disappears under anaesthesia.

Abnormal attitudes of the limb occur earlier, and are more pronounced in cases in which pain and other irritative symptoms of articular disease are well marked, and are best illustrated by the attitudes assumed in disease of the hip. They are due to reflex or involuntary contraction of the muscles acting on the joint, with the object of placing it in the attitude of greatest ease; they also disappear under anaesthesia. With the lapse of time they not only become exaggerated, but may become permanent from ankylosis or from contracture of the soft parts round the joint.

Startings at night are to be regarded as an indication that there is progressive disease involving the articular surfaces.

The formation of extra-articular abscess may take place early, or it may not occur till long after the disease has subsided. The abscess may develop so insidiously that it does not attract attention until it has

attained considerable size, especially when associated with disease of the spine, pelvis, or hip. The position of the abscess in relation to different joints is fairly constant and is determined by the anatomical relationships of the capsule and synovial membrane to the surrounding tissues. The bursae and tendon sheaths in the vicinity may influence the direction of spread of the abscess and the situation of resulting sinuses. When the abscess is allowed to burst, or is opened and becomes infected with pyogenic bacteria, there is not only the risk of aggravation of the disease and persistent suppuration, but there is a greater liability to general tuberculosis.

The sinuses may be so tortuous that a probe cannot be passed to the primary focus of disease, and their course and disposition can only be demonstrated by injecting the sinuses with an emulsion of bismuth and taking X-ray photographs.

Tuberculous infection of the lymph glands of the limb is exceptional, but may follow upon infection of the skin around the orifice of a sinus.

A slight rise of temperature in the evening may be induced in quiescent joint lesions by injury or by movement of the joint under anaesthesia, or by the fatigue of a railway journey. When sinuses have formed and become infected with pyogenic bacteria, there may be a diurnal variation in the temperature of the type known as hectic fever (Fig. 11).

Relative Frequency of Tuberculous Disease in Different Joints.--Hospital statistics show that joints are affected in the following order of frequency: Spine, knee, hip, ankle and tarsus, elbow, wrist, shoulder. The hip and spine are most often affected in childhood and youth, the shoulder and wrist in adults; the knee, ankle, and elbow show little age preference.

Clinical Variations of Tuberculous Joint Disease.--The above description applies to tuberculous joint disease in general; it must be modified to include special manifestations or varieties.

When the main incidence of the infection affects the synovial membrane, the clinical picture may assume the form of a hydrops, or of an empyema in which the joint is filled with pus. More common than either of these is the well-known white swelling or tumor albus (Wiseman, 1676) which is the clinical manifestation of diffuse thickening of the synovial membrane along with mucoid degeneration of the peri-synovial cellular tissue. It is well seen in joints which are superficial--such as the knee, ankle, elbow, and wrist. The swelling, which is the first and most prominent clinical feature, develops gradually and painlessly, obliterating the bony prominences by filling up the natural hollows. It appears greater to the eye than is borne out by measurement, being thrown into relief by the wasting of the muscles above and below the joint. In the early stage the swelling is elastic, doughy, and non-sensitive, and corresponds to the superficial area of the synovial membrane involved, and there is comparatively little complaint on the part of the patient, because the articular surfaces and ligaments are still intact. There may be a feeling of weight in the limb, and in the case of the knee and ankle the patient tires on walking and drags the leg with more or less of a limp. Movements of the joint are permitted, but are limited in range. The disability is increased by use and exertion, but, for a time at least, it improves under rest.

If the disease is not arrested, there follow the symptoms and signs of involvement of the articular surfaces.

Influence of Tuberculous Joint Disease on the General Health.--Experience shows that the early stages of tuberculous joint disease are compatible with the appearance of good health. As a rule, however, and especially if there is mixed infection, the health suffers, the appetite is impaired, the patient is easily tired, and there may be some loss of weight.

#Treatment.#--In addition to the general treatment of tuberculosis, local measures are employed. These may be described under two heads--the

conservative and the operative.

Conservative treatment is almost always to be employed in the first instance, as by it a larger proportion of cures is obtained with a smaller mortality and with better functional results than by operation.

Treatment by rest implies the immobilisation of the diseased limb until pain and tenderness have disappeared. The attitude in which the limb is immobilised should be that in which, in the event of subsequent stiffness, it will be most serviceable to the patient. Immobilisation may be secured by bandages, splints, extension, or other apparatus.

Extension with weight and pulley is of value in securing rest, especially in disease of the hip or knee; it eliminates muscular spasm, relieves pain and startings at night, and prevents abnormal attitudes of the limb. If, when the patient first comes under observation, the limb is in a deformed attitude which does not readily yield to extension, the deformity should be corrected under an anaesthetic.

The induction of hyperaemia is often helpful, the rubber bandage or the hot-air chamber being employed for an hour or so morning and evening.

Injection of Iodoform.--This is carried out on the same lines as have been described for tuberculous abscess. After the fluid contents of the joint are withdrawn, the iodoform is injected; and this may require to be repeated in a month or six weeks.

After the injection of iodoform there is usually considerable reaction, attended with fever (101 o F.), headache, and malaise, and considerable pain and swelling of the joint. In some cases there is sickness, and there may be blood pigment in the urine. The severity of these phenomena diminishes with each subsequent injection.

The use of Scott's dressing and of blisters and of the actual cautery has largely gone out of fashion, but the cautery may still be employed with benefit for the relief of pain in cases in which ulceration of cartilage is a prominent feature.

The application of the X-rays has proved beneficial in synovial lesions in superficial joints such as the wrist or elbow; prolonged exposures are made at fortnightly intervals, and on account of the cicatricial contraction which attends upon recovery, the joint must be kept in good position.

Conservative treatment is only abandoned if improvement does not show itself after a thorough trial, or if the disease relapses after apparent cure.

Operative Treatment.--Other things being equal, operation is more often indicated in adults than in children, because after the age of twenty there is less prospect of recovery under conservative treatment, there is more tendency for the disease to relapse and to invade the internal organs, and there is no fear of interfering with the growth of the bones. The state of the general health may necessitate operation as the most rapid method of removing the disease. The social status of the patient must also be taken into account; the bread-winner, under existing social conditions, may be unable to give up his work for a sufficient time to give conservative measures a fair trial.

The local conditions which decide for or against operation are differently regarded by different surgeons, but it may be said in general terms that operative interference is indicated in cases in which the disease continues to progress in spite of a fair trial of conservative measures; in cases unsuited for conservative treatment--that is to say, where there are severe bone lesions. Operative interference is indicated also when the functional result will be better than that likely to be obtained by conservative measures, as is often the case in the knee and elbow. Cold abscesses should, if possible, be dealt with before operating on the joint.

In many cases the extent of the operation can only be decided after

exploration. The aim is to remove all the disease with the least impairment of function and the minimum sacrifice of healthy tissue. The more open the method of operating the better, so that all parts of the joint may be available for inspection. The methods of Kocher, which permit of dislocating the joint, are specially to be recommended, as this procedure affords the freest possible access. Diseased synovial membrane is removed with the scissors or knife. If the cartilages are sound, and if a movable joint is aimed at, they may be left; but if ankylosis is desired, they must be removed. Localised disease of the cartilage should be removed with the spoon or gouge, and the bone beneath investigated. If the articular surface is extensively diseased, a thin slice of bone should be removed, and if foci in the marrow are then revealed, it is better to gouge them out than to remove further slices of bone, as this involves sacrifice of the cortex and periosteum.

Operative treatment of deformities resulting from tuberculous joint disease has almost entirely replaced reduction by force; the contracted soft parts are divided, and the bone is resected.

Amputation for tuberculous joint disease has become one of the rare operations of surgery, and is only justified when less radical measures have failed and the condition of the limb is affecting the general health. Amputation is more frequently called for in persons past middle life who are the subjects of pulmonary tuberculosis.

SYPHILITIC DISEASE

Syphilitic affections of joints are comparatively rare. As in tuberculosis, the disease may be first located in the synovial membrane, or it may spread to the joint from one of the bones.

In acquired syphilis, at an early stage and before the skin eruptions appear, one of the large joints, such as the shoulder or knee, may be the seat of pain--arthralgia--which is worse at night. In the secondary stage, a synovitis with serous effusion is not uncommon, and may affect several joints. Syphilitic hydrops is met with almost exclusively in the knee; it is frequently bilateral, and is insidious in its onset and progress, the patient usually being able to go about.

In the tertiary stage the joint lesions are persistent and destructive, and result from the formation of gummata, either in the deeper layers of the synovial membrane or in the adjacent bone or periosteum.

Peri-synovial and peri-bursal gummata are met with in relation to the knee-joint of middle-aged adults, especially women. They are usually multiple, develop slowly, and are rarely sensitive or painful. One or more of the gummata may break down and give rise to tertiary ulcers. The co-existence of indolent swellings, ulcers, and depressed scars in the vicinity of the knee is characteristic of tertiary syphilis.

The disease spreads throughout the capsule and synovial membrane, which becomes diffusely thickened and infiltrated with granulation tissue which eats into and replaces the articular cartilage. Clinically, the condition resembles tuberculous disease of the synovial membrane, for which it is probably frequently mistaken, but in the syphilitic affection the swelling is nodular and uneven, and the subjective symptoms are slight, mobility is little impaired, and yet the deformity is considerable.

Syphilitic osteo-arthritis results from a gumma in the periosteum or marrow of one of the adjacent bones. There is gradual enlargement of one of the bones, the patient complains of pains, which are worst at night. The disease may extend to the synovial membrane and be attended with effusion into the joint, or it may erupt on the periosteal surface and invade the skin, forming one or more sinuses. The further progress is complicated by the occurrence of pyogenic infection leading to necrosis of bone, in the knee-joint, for example, the patella or one of the condyles of the femur or tibia, may furnish a sequestrum. In such cases,

anti-syphilitic treatment must be supplemented by operation for the removal of the diseased tissues. In the knee, excision is rarely necessary; but in the elbow it may be called for to obtain a movable joint.

In #inherited syphilis# the earliest joint affections are those in which there is an effusion into the joint, especially the knee or elbow; and in exceptional cases pyogenic infection may be superadded, and pus form in the joint.

In older children, a gummatous synovitis is met with of which the most striking features are: its insidious development, its chronic course, symmetrical distribution, freedom from pain, the free mobility of the joint, its tendency to relapse, and its association with other syphilitic stigmata, especially in the eyes. The knees are the joints most frequently affected, and the condition usually yields readily to anti-syphilitic treatment without impairment of function.

JOINT DISEASES ACCOMPANYING CERTAIN CONSTITUTIONAL CONDITIONS

#Gout.#--_Arthritis Urica._--One of the manifestations of gout is that certain joints are liable to attacks of inflammation associated with the deposit of a chalk-like material composed of sodium biurate, chiefly in the matrix of the articular cartilage, it may be in streaks or patches towards the central area of the joint, or throughout the entire extent of the cartilage, which appears as if it had been painted over with plaster of Paris. As a result of this uratic infiltration, the cartilage loses its vitality and crumbles away, leading to the formation of what are known as gouty ulcers, and these may extend through the cartilage and invade the bone. The deposit of urates in the synovial membrane is attended with effusion into the joint and the formation of adhesions, while in the ligaments and peri-articular structures it leads to the formation of scar tissue. The metatarso-phalangeal joint of the great toe, on one or on both sides, is that most frequently affected. The disease is met with in men after middle life, and while common enough in England and Ireland, is almost unknown in hospital practice in Scotland.

The clinical features are characteristic. There is a sudden onset of excruciating pain, usually during the early hours of the morning, the joint becomes swollen, red, and glistening, with engorgement of the veins and some fever and disturbance of health and temper. In the course of a week or ten days there is a gradual return to the normal. Such attacks may recur only once a year or they may be more frequent; the successive attacks tend to become less acute but last longer, and the local phenomena persist, the joint remaining permanently swollen and stiff. Masses of chalk form in and around the joint, and those in the subcutaneous tissue may break through the skin, forming indolent ulcers with exposure of the chalky masses (tophi). The hands may become seriously crippled, especially when the tendon sheaths and bursae also are affected; the crippling resembles that resulting from arthritis deformans but it differs in not being symmetrical.

The local treatment consists in employing soothing applications and a Bier's bandage for two or three hours twice daily while the symptoms are acute; later, hot-air baths, massage, and exercises are indicated. It is remarkable how completely even the most deformed joints may recover their function. Dietetic and medicinal treatment must also be employed.

#Chronic Rheumatism.#--This term is applied to a condition which sometimes follows upon acute articular rheumatism in persons presenting a family tendency to acute rheumatism or to inflammations of serous membranes, and manifesting other evidence of the rheumatic taint, such as chorea or rheumatic nodules.

The changes in the joints involve almost exclusively the synovial membrane and the ligaments; they consist in cellular infiltration and exudation, resulting in the formation of new connective tissue which encroaches on the cavity of the joint and gives rise to adhesions, and by contracting causes stiffness and deformity. The articular cartilages

may subsequently be transformed into connective tissue, with consequent fibrous ankylosis and obliteration of the joint. The bones are affected only in so far as they undergo fatty atrophy from disuse of the limb, or alteration in their configuration as a result of partial dislocation. Osseous ankylosis may occur, especially in the small joints of the hand and foot.

The disease is generally poly-articular and may be met with in childhood and youth as well as in adult life. In some cases pain is so severe that the patient resists the least attempt at movement. In others, the joints, although stiff, can be moved but exhibit pronounced crackings. When there is much connective tissue formed in relation to the synovial membrane, the joint is swollen, and as the muscles waste above and below, the swelling is spindle-shaped. Subacute exacerbations occur from time to time, with fever and aggravation of the local symptoms and implication of other joints. After repeated recurrences, there is ankylosis with deformity, the patient becoming a helpless cripple. On account of the tendency to visceral complications, the tenure of life is uncertain.

From the nature of the disease, treatment is for the most part palliative. Salicylates are only of service during the exacerbations attended with pyrexia. The application of soda fomentations, turpentine cloths, or electric or hot-air baths may be useful. Improvement may result from the general and local therapeutics available at such places as Bath, Buxton, Harrogate, Strathpeffer, Wiesbaden, or Aix. In selected cases, a certain measure of success has followed operative interference, which consists in a modified excision. The deformities resulting from chronic rheumatism are but little amenable to surgical treatment, and forcible attempts to remedy stiffness or deformity are to be avoided.

#Arthritis Deformans# (Osteo-arthritis, Rheumatoid Arthritis, Rheumatic Gout, Malum Senile, Traumatic or Mechanical Arthritis).--Under the term arthritis deformans, which was first employed by Virchow, it is convenient to include a number of joint affections which have many anatomical and clinical features in common.

The disease is widely distributed in the animal kingdom, both in domestic species and in wild animals in the natural state such as the larger carnivora and the gorilla; evidence of it has also been found in the bones of animals buried with prehistoric man.

The morbid changes in the joints present a remarkable combination of atrophy and degeneration on the one hand and overgrowth on the other, indicating a profound disturbance of nutrition in the joint structures. The nature of this disturbance and its etiology are imperfectly known. By many writers it is believed to depend upon some form of auto-intoxication, the toxins being absorbed from the gastro-intestinal tract, and those who suffer are supposed to possess what has been called an "arthritic diathesis."

The localisation of the disease in a particular joint may be determined by several factors, of which trauma appears to be the most important. The condition is frequently observed to follow, either directly or after an interval, upon a lesion which involves gross injury of the joint or of one of the neighbouring bones. It occurs with greater frequency after repeated minor injuries affecting the joint and its vicinity, such as sprains and contusions, and particularly those sustained in laborious occupations. This connection between trauma and arthritis deformans led Arbuthnot Lane to apply to it the term traumatic or trade arthritis.

The traumatic or strain factor in the production of the disease may be manifested in a less obvious fashion. In the lower extremity, for example, any condition which disturbs the static equilibrium of the limb as a whole would appear to predispose to the disease in one or other of the joints. The static equilibrium may be disturbed by such deformities as flat-foot or knock-knee, and badly united fractures of the lower extremity. In hallux valgus, the metatarso-phalangeal joint of the great toe undergoes changes characteristic of arthritis deformans.

A number of cases have been recorded in which arthritis deformans has followed upon antecedent disease of the joint, such as pyogenic or gonorrhoeal synovitis, upon repeated haemorrhages into the knee-joint in bleeders, and in unreduced dislocations in which a new joint has been established.

[Illustration: FIG. 157.--Arthritis Deformans of Elbow, showing destruction of articular surfaces and masses of new bone around the articular margins.]

(Anatomical Museum, University of Edinburgh.)]

Lastly, Poncet and other members of the Lyons school regard arthritis deformans as due to an attenuated form of tuberculous infection, and draw attention to the fact that a tuberculous family history is often met with in the subjects of the disease.

[Illustration: FIG. 158.--Arthritis Deformans of Knee, showing eburnation and grooving of articular surfaces.]

(Anatomical Museum, University of Edinburgh.)]

Morbid Anatomy.--The commonest type is that in which the articular surfaces undergo degenerative changes. The primary change involves the articular cartilage, which becomes softened and fibrillated and is worn away until the subjacent bone is exposed. If the bone is rarefied, the enlarged cancellous spaces are opened into and an eroded and worm-eaten appearance is brought about; with further use of the joint, the bone is worn away, so that in a ball-and-socket joint like the hip, the head of the femur and the acetabulum are markedly altered in size and shape. More commonly, the bone exposed as a result of disappearance of the cartilage is denser than normal, and under the influence of the movements of the joint, becomes smooth and polished--a change described as eburnation of the articular surfaces (Fig. 158). In hinge-joints such as the knee and elbow, the influence of movement is shown by a series of parallel grooves corresponding to the lines of friction (Fig. 158).

[Illustration: FIG. 159.--Hypertrophied Fringes of Synovial Membrane in Arthritis Deformans of Knee.]

(Museum of Royal College of Surgeons, Edinburgh.)]

While these degenerative changes are gradually causing destruction of the articular surfaces, reparative and hypertrophic changes are taking place at the periphery. Along the line of the junction between the cartilage and synovial membrane, the proliferation of tissue leads to the formation of nodules or masses of cartilage--ecchondroses--which are subsequently converted into bone (Fig. 157). Gross alterations in the ends of the bone are thus brought about which can be recognised clinically and in skiagrams, and which tend to restrict the normal range of movement. The extension of the ossification into the synovial reflection and capsular ligament adds a collar or "lip" of new bone, known as "lipping" of the articular margins, and also into other ligaments, insertions of tendons and intermuscular septa giving rise to bony outgrowths or osteophytes not unlike those met with in the neuro-arthropathies.

Proliferative changes in the synovial membrane are attended with increased vascularity and thickening of the membrane and an enlargement of its villi and fringes. When the fatty fringes are developed to an exaggerated degree, the condition is described as an arborescent lipoma (Fig. 159). Individual fringes may attain the size of a hazel nut, and the fibro-fatty tissue of which they are composed may be converted into cartilage and bone; such a body may remain attached by a narrow pedicle or stalk, or this may be torn across and the body becomes loose and, unless confined in a recess of the joint, it wanders about and may become impacted between the articular surfaces. These changes in the synovial membrane are often associated with an abundant exudate or hydrops. These degenerative and hypertrophic changes, while usually

attended with marked restriction of movement and sometimes by "locking" of the joint, practically never result in ankylosis.

The ankylosing type of chronic arthritis is fortunately much rarer than those described above, and is chiefly met with in the joints of the fingers and toes and in those of the vertebral column. The synovial membrane proliferates, grows over the cartilage, and replaces it, and when two such articular surfaces are in contact they tend to adhere, thus obliterating the joint, cavity, and resulting in fibrous or bony ankylosis. The changes progress slowly and, before they result in ankylosis, various sub-luxations and dislocations may occur with distortion and deformity which, in the case of the fingers, is extremely disabling and unsightly (Fig. 160).

Clinical Features.--It is usually observed that in patients who are still young the tendency is for the disease to advance with considerable rapidity, so that in the course of months it may cause crippling of several joints. The course of the disease as met with in persons past middle life is more chronic; it begins insidiously, and many years may pass before there is pronounced disability. The earliest symptom is stiffness, especially in the morning after rest, which passes off temporarily with use of the limb. As time goes on, the range of movement becomes restricted, and crackings occur. This stage of the disease may be prolonged indefinitely; if it progresses, stiffness becomes more pronounced, certain movements are lost, others develop in abnormal directions, and deformed attitudes add to the disablement. The disease is compatible with long life, but not with any active occupation, hence those of the hospital class who suffer from it tend to accumulate in workhouse infirmaries.

Hydrops is most marked in the knee, and may affect also the adjacent bursae. As the joint becomes distended with fluid, the ligaments are stretched, the limb becomes weak and unstable, and the patient complains of a feeling of weight, of insecurity, and of tiredness. Pain is occasional and evanescent, and is usually the result of some extra exertion, or exposure to cold and wet. This form of the disease is extremely chronic, and may last for an indefinite number of years. It is to be diagnosed from the other forms of hydrops already considered--the purely traumatic, the pyogenic, gonorrhoeal, tuberculous, and syphilitic--and from that associated with Charcot's disease.

Hypertrophied fringes and pedunculated or loose bodies often co-exist with hydrops, and give rise to characteristic clinical features, particularly in the knee. The fringes, especially when they assume the type of the arborescent lipoma, project into the cavity of the joint, filling up its recesses and distending its capsule so that the joint is swollen and slightly flexed. Pain is not a prominent feature, and the patient may walk fairly well. On grasping the joint while it is being actively flexed and extended, the fringes may be felt moving under the fingers. Symptoms from impaction of a loose body are exceptional.

[Illustration: FIG. 160.--Arthritis Deformans of Hands, showing symmetry of lesions, ulnar deviation of fingers, and nodular thickening at inter-phalangeal joints.]

The dry form of arthritis deformans, although specially common in the knee, is met with in other joints, either as a mono-articular or poly-articular disease; and it is also met with in the joints of the spine and of the fingers as well as in the temporo-mandibular joint. In the joints of the fingers the disease is remarkably symmetrical, and tends to assume a nodular type (Heberden's nodes) (Fig. 160); in younger subjects it assumes a more painful and progressive fusiform type (Fig. 161). In the larger joints the subjective symptoms usually precede

any palpable evidence of disease, the patient complaining of stiffness, crackings, and aching, aggravated by changes in the weather. The roughness due to fibrillation of the articular cartilages causes coarse friction on moving the joint, or, in the knee, on moving the patella on the condyles of the femur. It may be months or even years before the lipping and other hypertrophic changes in the ends of the bones are

recognisable, and before the joint assumes the deformed features which the name of the disease suggests.

The capsular ligament, except in hydrops, is the seat of connective-tissue overgrowth, and tends to become contracted and rigid. Intra-articular ligaments, such as the ligamentum teres in the hip, are usually worn away and disappear. The surrounding muscles undergo atrophy, tendons become adherent to their sheaths and may be ossified, and the sheaths of nerves may be involved by the cicatricial changes in the surrounding tissues.

The X-ray appearances of arthritis deformans necessarily vary with the type of the disease and the joint affected; in the joints of the fingers there is a narrowing of the spaces between the articular ends of the bones as a result of absorption of the articular cartilage, and rarefaction of the cancellous tissue in the vicinity of the joints; in the larger joints there is "lipping" of the articular margins, osteophytes, and other evidence of abnormal ossification in and around the joint. Eburnation of the articular surfaces is shown by increase in the density of the shadow of the bone in the areas affected.

[Illustration: FIG. 161.--Arthritis Deformans affecting several Joints, in a boy aet. 10.

(Dr. Dickson's case.)]

Treatment.--Treatment is for the most part limited to the relief of symptoms. On no account should the affected joints be kept at rest by means of splints or other apparatus. Active movements and exercises of all kinds are to be persevered with. When pain is a prominent feature, it may be relieved either by douches of iodine and hot water (tincture of iodine 1 oz. to the quart), or by the application of lint saturated with a lotion made up of chloral hydrate, gr. v, glycerin [dram]j, water [ounce]j, and covered with oil-silk. Strain and over-use of the joint and sudden changes of temperature are to be avoided. The induction of hyperaemia by means of massage, the elastic bandage, and hot-air baths is often of service. Operative interference is indicated when the disease is of a severe type, when it is mono-articular, and when the general condition of the patient is otherwise favourable. Excision has been practised with success in the hip, knee, elbow, and temporo-mandibular joints. Limitation of movement and locking at the hip-joint when due to new bone round the edge of the acetabulum may be greatly relieved by removal of the bone--a procedure known as cheilotomy. Loose bodies and hypertrophied fringes if causing symptoms may also be removed by operation.

When stiffness and grating on movement are prominent features we have found the injection of from half to one ounce of sterilised white vaseline afford decided relief.

The patient should be nourished well, and there need be no restriction in the diet such as is required in gouty patients, so long as the digestion is not impaired. Benefit is also derived from the administration of cod-liver oil, and of tonics, such as strychnine, arsenic, and iron, and in some cases of iodide of potassium. Luff recommends the administration over long periods of guaiacol carbonate, in cachets beginning with doses of 5-10 grs. and increased to 15-20 grs. thrice daily. A course of treatment at one of the reputed spas--Aix, Bath, Buxton, Gastein, Harrogate, Strathpeffer, Wiesbaden, Wildbad--is often beneficial.

In some cases benefit has followed the prolonged internal administration of liquid paraffin.

On the assumption that the condition is the result of an auto-intoxication from the intestinal tract, saline purges and irrigation of the colon are indicated, and Arbuthnot Lane claims to have brought about improvement by short-circuiting or by resecting the colon.

Residence in a warm and dry climate, with an open-air life, has been

known to arrest the disease when other measures have failed to give relief.

The application of radium and the ingestion of radio-active waters have also been recommended.

#Haemophilic# or #Bleeder's Joint#.--This is a rare but characteristic affection met with chiefly in the knee-joint of boys who are the subjects of haemophilia. After some trivial injury, or even without apparent cause, a haemorrhage takes place into the joint. The joint is tensely swollen, cannot be completely extended, and is so painful that the patient is obliged to lie up. The temperature is often raised (101° to 102° F.), especially if there are also haemorrhages elsewhere. The blood in the joint is slowly re-absorbed, and by the end of a fortnight or so, the symptoms completely disappear. As a rule these attacks are repeated; the pain attending them diminishes, but the joint becomes the seat of permanent changes: the synovial membrane is thickened, abnormally vascular, and coloured brown from the deposit of blood pigment; on its surface, and in parts of the articular cartilage, there is a deposit of rust-coloured fibrin; there may be extensive adhesions, and in some cases changes occur like those observed in arthritis deformans with erosion and ulceration of the cartilage and a form of dry caries of the articular surfaces, which may terminate in ankylosis.

As the swelling of the joint is associated with wasting of the muscles, with stiffness, and with flexion, the condition closely resembles tuberculous disease of the synovial membrane. From errors in diagnosis such joints have been operated upon, with disastrous results due to haemorrhage.

The treatment of a recent haemorrhage consists in securing absolute rest and applying elastic compression. The introduction of blood-serum (10-15 c.c.) into a vein may assist in arresting the haemorrhage; anti-diphtheritic serum is that most readily obtainable.

After an interval, measures should be adopted to promote the absorption of blood and to prevent stiffness and flexion; these include massage, movements, and extension with weight and pulley.

JOINT DISEASES ASSOCIATED WITH LESIONS OF THE NERVOUS SYSTEM: NEURO-ARTHROPATHIES

In Lesions of Peripheral Nerves.--In the hand, and more rarely in the foot, when one or other of the main nerve-trunks has been divided or compressed, the joints may become swollen and painful and afterwards become stiff and deformed. Bony ankylosis has been observed.

In Affections of the Spinal Medulla.--In myelitis, progressive muscular atrophy, poliomyelitis, insular sclerosis, and in traumatic lesions, joint affections are occasionally met with.

The occurrence of joint lesions in locomotor ataxia (*tabes dorsalis*) was first described by Charcot in 1868--hence the term "Charcot's disease" applied to them. Although they usually develop in the ataxic stage, one or more years after the initial spinal symptoms, they may appear before there is any evidence of tabes. The onset is frequently determined by some injury. The joints of the lower extremity are most commonly affected, and the disease is bilateral in a considerable proportion of cases--both knees or both hips, for instance, being implicated.

Among the theories suggested in explanation of these arthropathies the most recent is that by Babinski and Barre, which traces the condition to vascular lesions of a syphilitic type in the articular arteries.

The first symptom is usually a swelling of the joint and its vicinity. There is no redness or heat and no pain on movement. The peri-articular swelling, unlike ordinary oedema, scarcely pits even on firm pressure.

[Illustration: FIG. 162.--Bones of Knee-joint in advanced stage of Charcot's Disease. The medial part of the head of the tibia has disappeared.

(Anatomical Museum, University of Edinburgh).]

In mild cases this condition of affairs may persist for months; in severe cases destructive changes ensue with remarkable rapidity. The joint becomes enormously swollen, loses its normal contour, and the ends of the bones become irregularly deformed (Fig. 162). Sometimes, and especially in the knee, the clinical features are those of an enormous hydrops with fibrinous and other loose bodies and hypertrophied fringes--and great oedema of the peri-articular tissues (Fig. 163). The joint is wobbly or flail-like from stretching and destruction of the controlling ligaments, and is devoid of sensation. In other cases, wearing down and total disappearance of the ends of the bones is the prominent feature, attended with flail-like movements and with coarse grating. Dislocation is observed chiefly at the hip, and is rather a gross displacement with unnatural mobility than a typical dislocation, and it is usually possible to move the bones freely upon one another and to reduce the displacement. A striking feature is the extensive formation of new bone in the capsular ligament and surrounding muscles. The enormous swelling and its rapid development may suggest the growth of a malignant tumour. The most useful factor in diagnosis is the entire absence of pain, of tenderness, and of common sensibility. The freedom with which a tabetic patient will allow his disorganised joint to be handled requires to be seen to be appreciated.

[Illustration: FIG. 163.--Charcot's Disease of Left Knee. The joint is distended with fluid and the whole limb is oedematous.]

The rapidity of the destructive changes in certain cases of tabes, and the entire absence of joint lesions in others, would favour the view that special parts of the spinal medulla must be implicated in the former group.

In syringomyelia, joint affections (gliomatous arthropathies) are more frequent than in tabes, and they usually involve the upper extremity in correspondence with the seat of the spinal lesion, which usually affects the lower cervical and upper thoracic segments. Except that the joint disease is seldom symmetrical, it closely resembles the arthropathy of tabes. The completeness of the analgesia of the articular structures and of the overlying soft parts is illustrated by the fact that in one case the patient himself was in the habit of letting out the fluid from his elbow with the aid of a pair of scissors, and that in another the joint was painlessly excised without an anaesthetic.

[Illustration: FIG. 164.--Charcot's Disease of both Ankles: front view. Man, aet. 32.]

The disease may become arrested or may go on to complete disorganisation; suppuration may ensue from infection through a breach of the surface, and in rare cases the joint has become the seat of tuberculosis.

[Illustration: FIG. 165.--Charcot's Disease of both Ankles: back view. Man, aet. 32.]

Treatment, in addition to that of the nerve lesion underlying the arthropathy, consists in supporting and protecting the joint by means of bandages, splints, and other apparatus. In the lower extremity, the use of crutches is helpful in taking the strain off the affected limb. When there is much distension of the joint, considerable relief follows upon withdrawal of fluid. The best possible result being rigid ankylosis in a good position, it may be advisable to bring this about artificially by arthrodesis or resection. Operation is indicated when only one joint is affected and when the cord lesion is such as will permit of the patient using the limb. The wounds heal well, but the victims of tabes are unfavourable subjects for operative interference, on account of their liability to intercurrent complications. When the limb is quite useless,

amputation may be the best course.

In cerebral lesions attended with hemiplegia, joint affections, characterised by evanescent pain, redness, and swelling, are occasionally met with. The secondary changes in joints which are the seat of paralytic contracture are considered with the surgery of the Extremities.

In cases of hysteria and other functional affections of the nervous system, an intermittent neuropathic hydrops has been observed--especially in the knee. Without apparent cause, the joint fills with fluid and its movements become restricted, and after from two to eight days the swelling subsides and the joint returns to normal. A remarkable feature of the condition is that the effusion into the joint recurs at regular intervals, it may be over a period of years. Psychic conditions have been known to induce attacks, and sometimes to abort them or even to cause their disappearance. Hence it has been recommended that treatment by suggestion should be employed along with tonic doses of quinine and arsenic.

HYSERICAL OR MIMETIC JOINT AFFECTIONS

Under this heading, Sir Benjamin Brodie, in 1822, described an affection of joints, characterised by the prominence of subjective symptoms and the absence of pathological changes. Although most frequently met with in young women with an impressionable nervous system, and especially among those in good social circumstances, it occurs occasionally in men. The onset may be referred to injury or exposure to cold, or may be associated with some disturbance of the emotions or of the generative organs; or the condition may be an involuntary imitation of the symptoms of organic joint disease presented by a relative or friend.

It is characteristic that the symptoms develop abruptly without satisfactory cause, that they are exaggerated and wanting in harmony with one another, and that they do not correspond with the features of any of the known forms of organic disease. In some cases the only complaint is of severe pain; more often this is associated with excessive tenderness and with impairment of the functions of the joint. On examination the joint presents a normal appearance, but the skin over it is remarkably sensitive. A light touch is more likely to excite pain than deep and firm pressure. Stiffness is a variable feature--in some cases amounting to absolute rigidity, so that no ordinary force will elicit movement. It is characteristic of this, as of other neuroses, that the symptoms come and go without sufficient cause. When the patient's attention is diverted, the pain and stiffness may disappear. There is no actual swelling of the joint, although there may be an appearance of this from wasting of the muscles above and below. If the joint is kept rigid for long periods, secondary contracture may occur--in the knee with flexion, in the hip with flexion and adduction.

The diagnosis is often a matter of considerable difficulty, and the condition is liable to be mistaken for such organic lesions as a tuberculous or pyogenic focus in the bone close to the joint.

The greatest difficulty is met with in the knee and hip, where the condition may closely simulate tuberculous disease. The use of the Rontgen rays, or examination of the joint under anaesthesia, is helpful.

The local treatment consists chiefly in improving the nutrition of the affected limb by means of massage, exercises, baths, and electricity. Splints are to be avoided. In refractory cases, benefit may follow the application of blisters or of Corrigan's button. The general condition of the patient must be treated on the same lines as in other neuroses. The Weir-Mitchell treatment may have to be employed in obstinate cases, the patient being secluded from her friends and placed in charge of a nurse. Complete recovery is the rule, but when the muscles are weak and wasted from prolonged disuse, a considerable time may elapse before the limb returns to normal.

TUMOURS AND CYSTS

New growths taking origin in the synovial membrane are rare, and are not usually diagnosed before operation. They are attended with exudation into the joint, and in the case of sarcoma the fluid is usually blood-stained. If the tumour projects in a polypoidal manner into the joint, it may cause symptoms of loose body. One or two cases have been recorded in which a cartilaginous tumour growing from the synovial membrane has erupted through the joint capsule and infiltrated the adjoining muscles. Multiple cartilaginous tumours forming loose bodies are described on p. 544.

Cysts of joints constitute an ill-defined group which includes ganglia formed in relation to the capsular ligament. Cystic distension of bursae which communicate with the joint is most often met with in the region of the knee in cases of long-standing hydrops. It was suggested by Morrant Baker that cystic swellings may result from the hernial protrusion of the synovial membrane between the stretched fibres of the capsular ligament, and the name "Baker's cysts" has been applied to these.

In the majority of cases, cysts in relation to joints give rise to little inconvenience and may be left alone. If interfered with at all, they should be excised.

LOOSE BODIES

It is convenient to describe the varieties of loose bodies under two heads: those composed of fibrin, and those composed of organised connective tissue.

#Fibrinous Loose Bodies# (*Corpora oryzoidea*).--These are homogeneous or concentrically laminated masses of fibrin, sometimes resembling rice grains, melon seeds, or adhesive wafers, sometimes quite irregular in shape. Usually they are present in large numbers, but sometimes there is only one, and it may attain considerable dimensions. They are not peculiar to joints, for they are met with in tendon sheaths and bursae, and their origin from synovial membrane may be accepted as proved. They occur in tuberculosis, arthritis deformans, and in Charcot's disease, and their presence is almost invariably associated with an effusion of fluid into the joint. While they may result from the coagulation of fibrin-forming elements in the exudate, their occurrence in tuberculous hydrops would appear to be the result of coagulation necrosis, or of fibrinous degeneration of the surface layer of the diseased synovial membrane. However formed, their shape is the result of mechanical influences, and especially of the movement of the joint.

Clinically, loose bodies composed of fibrin constitute an unimportant addition to the features of the disease with which they are associated. They never give rise to the classical symptoms associated with impaction of a loose body between the articular surfaces. Their presence may be recognised, especially in the knee, by the crepitating sensation imparted to the fingers of the hand grasping the joint while it is flexed and extended by the patient.

The treatment is directed towards the disease underlying the hydrops. If it is desired to empty the joint, this is best done by open incision.

[Illustration: FIG. 166.--Radiogram of Multiple Loose Bodies in Knee-joint and Semi-membranosus Bursa in a man aet. 38.

(Mr. J. W. Dowden's case.)]

#Bodies composed of Organised Connective Tissue.#--These are comparatively common in joints that are already the seat of some chronic disease, such as arthritis deformans, Charcot's arthropathy, or synovial tuberculosis. They take origin almost exclusively from an erratic overgrowth of the fringes of the synovial membrane, and may consist

entirely of fat, the arborescent lipoma (Fig. 159) being the most pronounced example of this variety. Fibrous tissue or cartilage may form in one or more of the fatty fringes and give rise to hard nodular masses, which may attain a considerable size, and in course of time may undergo ossification.

Like other hypertrophies on a free surface, they tend to become pedunculated, and so acquire a limited range of movement. The pedicle may give way and the body become free. In this condition it may wander about the joint, or lie snugly in one of its recesses until disturbed by some sudden movement. A loose body free in a joint is capable of growth, deriving the necessary nutriment from the surrounding fluid. The size and number of the bodies vary widely. Single specimens have been known to attain the size of the patella. The smaller varieties may number considerably over a hundred.

[Illustration: FIG. 167.--Loose Body from Knee-joint of man aet. 25.
Natural size.]

a = Convex surface. b = Concave surface.]

In arthritis deformans a rarer type of loose body is met with, a portion of the lippling of one of the articular margins being detached by injury. In Charcot's disease, bodies composed of bone are formed in relation to the capsular and other ligaments, and may be made to grate upon one another.

The clinical features in this group are mainly those of the disease which has given rise to the loose bodies, and it is exceptional to meet with symptoms from impaction of the body between the articular surfaces. Treatment is to be directed towards the primary disease in the joint, as well as to the removal of the loose bodies.

[Illustration: FIG. 168.--Multiple partially ossified Chondromas of Synovial Membrane, from Shoulder-joint, the seat of arthritis deformans, from a man aet. 35.]

Loose Bodies in Joints which are otherwise healthy.--It is in joints otherwise healthy that loose bodies causing the classical symptoms and calling for operative treatment are most frequently met with. They occur chiefly in the knee and elbow of healthy males under the age of thirty. The complaint may be of vague pains, of occasional cracking on moving the joint, or of impairment of function--usually an inability to extend or flex the joint completely. In many cases a clear account is given of the symptoms which arise when the body is impacted between the articular surfaces, namely, sudden onset of intense sickening pain, loss of power in the limb and locking of the joint, followed by effusion and other accompaniments of a severe sprain. On some particular movement, the body is disengaged, the locking disappears, and recovery takes place. Attacks of this kind may recur at irregular intervals, during a period of many years. On examining the joint, it is usually found to contain fluid, and there may be points of special tenderness corresponding to the ligaments that have been overstretched. In cases in which there has been recurrent attacks of locking, the ligaments become slack, the joint is wobbly, and the quadriceps is wasted. The patient himself, or the surgeon, may discover the loose body and feel it roll beneath his fingers, especially if it is lodged in the supra-patellar pouch in the knee, or on one or other side of the olecranon in the elbow. In most instances the patient has carefully observed his own symptoms, and is aware not only of the existence of the loose body, but of its erratic appearance at different parts of the joint. This feature serves to differentiate the lesions from a torn medial meniscus in which the pain and tenderness are always in the same spot. As the body usually contains bone, it is recognisable in a skiagram.

[Illustration: FIG. 169.--Multiple Cartilaginous Loose Bodies from Knee-joint.]

There are two methods of removing the body; the first and simpler method is applicable when the body can be palpated, usually in the

supra-patellar pouch; it is preferably transfixated by a needle and can then be removed through a small incision; otherwise, the joint must be freely opened and explored, firstly to find the body and further to remove it.

The characters of this type of loose body are remarkably constant. It is usually solitary, about the size of a bean or almond, concavo-convex in shape, the convex aspect being smooth like an articular surface, the concave aspect uneven and nodulated and showing reparative changes, healing over of the raw surface, and the new formation of fibrous tissue, hyaline cartilage and bone, the necessary nutriment being derived from the synovial fluid (Fig. 167). The body is sometimes found to be lodged in a defect or excavation in one of the articular surfaces, usually the medial condyle of the femur, from which it is readily shelled out by means of an elevator. It presents on section a layer of articular cartilage on the convex aspect and a variable thickness of spongy bone beneath this.

The origin of these bodies is one of the most debated questions in surgical pathology; they obviously consist of a portion of the articular surface of one of the bones, but how this is detached still remains a mystery; some maintain that it is purely traumatic; Konig regards them as portions of the articular surface which have been detached by a morbid process which he calls "osteochondritis dessicans."

Multiple Chondromas and Osteomas of the Synovial Membrane. --In this rare type of loose body, the surface of the synovial membrane is studded with small sessile or pedunculated tumours composed of pure hyaline cartilage, or of bone, or of transition stages between cartilage and bone. They are pearly white in colour, pitted and nodular on the surface, rarely larger than a pea, although when compressed they may cake into masses of considerable size. With the movements of the joint many of the tumours become detached and lie in the serous exudate excited by their presence. They are found also in the diverticula of the synovial membrane, in the shoulder in the downward prolongation along the tendon of the biceps, in the hip in the bursal extension beneath the psoas.

The patient complains of increasing disability of the limb, movements of the joint becoming more and more restricted and painful. There is swelling corresponding to the distended capsule of the joint, and on palpation the bodies moving under the fingers yield a sensation as of grains of rice shifting in a bag. If the bodies are so numerous as to be tightly packed together, the impression is that of a plastic mass having the shape of the synovial sac. The stiffness and the cracking on movement may suggest arthritis deformans, but the X-ray appearances make the diagnosis an easy one. We have observed two cases of this affection in the knee-joint of adult women, one in the shoulder-joint of an adult male (Fig. 168), and Caird has observed one in the hip. The treatment consists in opening the joint by free incision and removing the bodies.

Displacement of the menisci of the knee is referred to with injuries of that joint.

End of the Project Gutenberg EBook of Manual of Surgery, by
Alexis Thomson and Alexander Miles

*** END OF THIS PROJECT GUTENBERG EB00K MANUAL OF SURGERY ***

***** This file should be named 17921-8.txt or 17921-8.zip *****
This and all associated files of various formats will be found in:
<http://www.gutenberg.org/1/7/9/2/17921/>

Produced by Jonathan Ingram, Laura Wisewell and the Online
Distributed Proofreading Team at <http://www.pgdp.net>

Updated editions will replace the previous one--the old editions
will be renamed.

Creating the works from public domain print editions means that no
one owns a United States copyright in these works, so the Foundation
(and you!) can copy and distribute it in the United States without
permission and without paying copyright royalties. Special rules,
set forth in the General Terms of Use part of this license, apply to
copying and distributing Project Gutenberg-tm electronic works to
protect the PROJECT GUTENBERG-tm concept and trademark. Project
Gutenberg is a registered trademark, and may not be used if you
charge for the eBooks, unless you receive specific permission. If you
do not charge anything for copies of this eBook, complying with the
rules is very easy. You may use this eBook for nearly any purpose
such as creation of derivative works, reports, performances and
research. They may be modified and printed and given away--you may do
practically ANYTHING with public domain eBooks. Redistribution is
subject to the trademark license, especially commercial
redistribution.

*** START: FULL LICENSE ***

THE FULL PROJECT GUTENBERG LICENSE
PLEASE READ THIS BEFORE YOU DISTRIBUTE OR USE THIS WORK

To protect the Project Gutenberg-tm mission of promoting the free
distribution of electronic works, by using or distributing this work
(or any other work associated in any way with the phrase "Project
Gutenberg"), you agree to comply with all the terms of the Full Project
Gutenberg-tm License (available with this file or online at
<http://gutenberg.org/license>).

Section 1. General Terms of Use and Redistributing Project Gutenberg-tm
electronic works

1.A. By reading or using any part of this Project Gutenberg-tm
electronic work, you indicate that you have read, understand, agree to
and accept all the terms of this license and intellectual property
(trademark/copyright) agreement. If you do not agree to abide by all
the terms of this agreement, you must cease using and return or destroy
all copies of Project Gutenberg-tm electronic works in your possession.
If you paid a fee for obtaining a copy of or access to a Project
Gutenberg-tm electronic work and you do not agree to be bound by the
terms of this agreement, you may obtain a refund from the person or
entity to whom you paid the fee as set forth in paragraph 1.E.8.

1.B. "Project Gutenberg" is a registered trademark. It may only be
used on or associated in any way with an electronic work by people who
agree to be bound by the terms of this agreement. There are a few
things that you can do with most Project Gutenberg-tm electronic works
even without complying with the full terms of this agreement. See
paragraph 1.C below. There are a lot of things you can do with Project
Gutenberg-tm electronic works if you follow the terms of this agreement

and help preserve free future access to Project Gutenberg-tm electronic works. See paragraph 1.E below.

1.C. The Project Gutenberg Literary Archive Foundation ("the Foundation" or PGLAF), owns a compilation copyright in the collection of Project Gutenberg-tm electronic works. Nearly all the individual works in the collection are in the public domain in the United States. If an individual work is in the public domain in the United States and you are located in the United States, we do not claim a right to prevent you from copying, distributing, performing, displaying or creating derivative works based on the work as long as all references to Project Gutenberg are removed. Of course, we hope that you will support the Project Gutenberg-tm mission of promoting free access to electronic works by freely sharing Project Gutenberg-tm works in compliance with the terms of this agreement for keeping the Project Gutenberg-tm name associated with the work. You can easily comply with the terms of this agreement by keeping this work in the same format with its attached full Project Gutenberg-tm License when you share it without charge with others.

1.D. The copyright laws of the place where you are located also govern what you can do with this work. Copyright laws in most countries are in a constant state of change. If you are outside the United States, check the laws of your country in addition to the terms of this agreement before downloading, copying, displaying, performing, distributing or creating derivative works based on this work or any other Project Gutenberg-tm work. The Foundation makes no representations concerning the copyright status of any work in any country outside the United States.

1.E. Unless you have removed all references to Project Gutenberg:

1.E.1. The following sentence, with active links to, or other immediate access to, the full Project Gutenberg-tm License must appear prominently whenever any copy of a Project Gutenberg-tm work (any work on which the phrase "Project Gutenberg" appears, or with which the phrase "Project Gutenberg" is associated) is accessed, displayed, performed, viewed, copied or distributed:

This eBook is for the use of anyone anywhere at no cost and with almost no restrictions whatsoever. You may copy it, give it away or re-use it under the terms of the Project Gutenberg License included with this eBook or online at www.gutenberg.org

1.E.2. If an individual Project Gutenberg-tm electronic work is derived from the public domain (does not contain a notice indicating that it is posted with permission of the copyright holder), the work can be copied and distributed to anyone in the United States without paying any fees or charges. If you are redistributing or providing access to a work with the phrase "Project Gutenberg" associated with or appearing on the work, you must comply either with the requirements of paragraphs 1.E.1 through 1.E.7 or obtain permission for the use of the work and the Project Gutenberg-tm trademark as set forth in paragraphs 1.E.8 or 1.E.9.

1.E.3. If an individual Project Gutenberg-tm electronic work is posted with the permission of the copyright holder, your use and distribution must comply with both paragraphs 1.E.1 through 1.E.7 and any additional terms imposed by the copyright holder. Additional terms will be linked to the Project Gutenberg-tm License for all works posted with the permission of the copyright holder found at the beginning of this work.

1.E.4. Do not unlink or detach or remove the full Project Gutenberg-tm License terms from this work, or any files containing a part of this work or any other work associated with Project Gutenberg-tm.

1.E.5. Do not copy, display, perform, distribute or redistribute this electronic work, or any part of this electronic work, without prominently displaying the sentence set forth in paragraph 1.E.1 with active links or immediate access to the full terms of the Project Gutenberg-tm License.

1.E.6. You may convert to and distribute this work in any binary, compressed, marked up, nonproprietary or proprietary form, including any word processing or hypertext form. However, if you provide access to or distribute copies of a Project Gutenberg-tm work in a format other than "Plain Vanilla ASCII" or other format used in the official version posted on the official Project Gutenberg-tm web site (www.gutenberg.org), you must, at no additional cost, fee or expense to the user, provide a copy, a means of exporting a copy, or a means of obtaining a copy upon request, of the work in its original "Plain Vanilla ASCII" or other form. Any alternate format must include the full Project Gutenberg-tm License as specified in paragraph 1.E.1.

1.E.7. Do not charge a fee for access to, viewing, displaying, performing, copying or distributing any Project Gutenberg-tm works unless you comply with paragraph 1.E.8 or 1.E.9.

1.E.8. You may charge a reasonable fee for copies of or providing access to or distributing Project Gutenberg-tm electronic works provided that

- You pay a royalty fee of 20% of the gross profits you derive from the use of Project Gutenberg-tm works calculated using the method you already use to calculate your applicable taxes. The fee is owed to the owner of the Project Gutenberg-tm trademark, but he has agreed to donate royalties under this paragraph to the Project Gutenberg Literary Archive Foundation. Royalty payments must be paid within 60 days following each date on which you prepare (or are legally required to prepare) your periodic tax returns. Royalty payments should be clearly marked as such and sent to the Project Gutenberg Literary Archive Foundation at the address specified in Section 4, "Information about donations to the Project Gutenberg Literary Archive Foundation."
- You provide a full refund of any money paid by a user who notifies you in writing (or by e-mail) within 30 days of receipt that s/he does not agree to the terms of the full Project Gutenberg-tm License. You must require such a user to return or destroy all copies of the works possessed in a physical medium and discontinue all use of and all access to other copies of Project Gutenberg-tm works.
- You provide, in accordance with paragraph 1.F.3, a full refund of any money paid for a work or a replacement copy, if a defect in the electronic work is discovered and reported to you within 90 days of receipt of the work.
- You comply with all other terms of this agreement for free distribution of Project Gutenberg-tm works.

1.E.9. If you wish to charge a fee or distribute a Project Gutenberg-tm electronic work or group of works on different terms than are set forth in this agreement, you must obtain permission in writing from both the Project Gutenberg Literary Archive Foundation and Michael Hart, the owner of the Project Gutenberg-tm trademark. Contact the Foundation as set forth in Section 3 below.

1.F.

1.F.1. Project Gutenberg volunteers and employees expend considerable effort to identify, do copyright research on, transcribe and proofread public domain works in creating the Project Gutenberg-tm collection. Despite these efforts, Project Gutenberg-tm electronic works, and the medium on which they may be stored, may contain "Defects," such as, but not limited to, incomplete, inaccurate or corrupt data, transcription errors, a copyright or other intellectual property infringement, a defective or damaged disk or other medium, a computer virus, or computer codes that damage or cannot be read by your equipment.

1.F.2. LIMITED WARRANTY, DISCLAIMER OF DAMAGES - Except for the "Right of Replacement or Refund" described in paragraph 1.F.3, the Project Gutenberg Literary Archive Foundation, the owner of the Project Gutenberg-tm trademark, and any other party distributing a Project Gutenberg-tm electronic work under this agreement, disclaim all liability to you for damages, costs and expenses, including legal fees. YOU AGREE THAT YOU HAVE NO REMEDIES FOR NEGLIGENCE, STRICT LIABILITY, BREACH OF WARRANTY OR BREACH OF CONTRACT EXCEPT THOSE PROVIDED IN PARAGRAPH F3. YOU AGREE THAT THE FOUNDATION, THE TRADEMARK OWNER, AND ANY DISTRIBUTOR UNDER THIS AGREEMENT WILL NOT BE LIABLE TO YOU FOR ACTUAL, DIRECT, INDIRECT, CONSEQUENTIAL, PUNITIVE OR INCIDENTAL DAMAGES EVEN IF YOU GIVE NOTICE OF THE POSSIBILITY OF SUCH DAMAGE.

1.F.3. LIMITED RIGHT OF REPLACEMENT OR REFUND - If you discover a defect in this electronic work within 90 days of receiving it, you can receive a refund of the money (if any) you paid for it by sending a written explanation to the person you received the work from. If you received the work on a physical medium, you must return the medium with your written explanation. The person or entity that provided you with the defective work may elect to provide a replacement copy in lieu of a refund. If you received the work electronically, the person or entity providing it to you may choose to give you a second opportunity to receive the work electronically in lieu of a refund. If the second copy is also defective, you may demand a refund in writing without further opportunities to fix the problem.

1.F.4. Except for the limited right of replacement or refund set forth in paragraph 1.F.3, this work is provided to you 'AS-IS', WITH NO OTHER WARRANTIES OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OF MERCHANTABILITY OR FITNESS FOR ANY PURPOSE.

1.F.5. Some states do not allow disclaimers of certain implied warranties or the exclusion or limitation of certain types of damages. If any disclaimer or limitation set forth in this agreement violates the law of the state applicable to this agreement, the agreement shall be interpreted to make the maximum disclaimer or limitation permitted by the applicable state law. The invalidity or unenforceability of any provision of this agreement shall not void the remaining provisions.

1.F.6. INDEMNITY - You agree to indemnify and hold the Foundation, the trademark owner, any agent or employee of the Foundation, anyone providing copies of Project Gutenberg-tm electronic works in accordance with this agreement, and any volunteers associated with the production, promotion and distribution of Project Gutenberg-tm electronic works, harmless from all liability, costs and expenses, including legal fees, that arise directly or indirectly from any of the following which you do or cause to occur: (a) distribution of this or any Project Gutenberg-tm work, (b) alteration, modification, or additions or deletions to any Project Gutenberg-tm work, and (c) any Defect you cause.

Section 2. Information about the Mission of Project Gutenberg-tm

Project Gutenberg-tm is synonymous with the free distribution of electronic works in formats readable by the widest variety of computers including obsolete, old, middle-aged and new computers. It exists because of the efforts of hundreds of volunteers and donations from people in all walks of life.

Volunteers and financial support to provide volunteers with the assistance they need, is critical to reaching Project Gutenberg-tm's goals and ensuring that the Project Gutenberg-tm collection will remain freely available for generations to come. In 2001, the Project Gutenberg Literary Archive Foundation was created to provide a secure and permanent future for Project Gutenberg-tm and future generations. To learn more about the Project Gutenberg Literary Archive Foundation and how your efforts and donations can help, see Sections 3 and 4 and the Foundation web page at <http://www.pglaf.org>.

Section 3. Information about the Project Gutenberg Literary Archive Foundation

The Project Gutenberg Literary Archive Foundation is a non profit 501(c)(3) educational corporation organized under the laws of the state of Mississippi and granted tax exempt status by the Internal Revenue Service. The Foundation's EIN or federal tax identification number is 64-6221541. Its 501(c)(3) letter is posted at <http://pglaf.org/fundraising>. Contributions to the Project Gutenberg Literary Archive Foundation are tax deductible to the full extent permitted by U.S. federal laws and your state's laws.

The Foundation's principal office is located at 4557 Melan Dr. S. Fairbanks, AK, 99712., but its volunteers and employees are scattered throughout numerous locations. Its business office is located at 809 North 1500 West, Salt Lake City, UT 84116, (801) 596-1887, email business@pglaf.org. Email contact links and up to date contact information can be found at the Foundation's web site and official page at <http://pglaf.org>

For additional contact information:

Dr. Gregory B. Newby
Chief Executive and Director
gbnewby@pglaf.org

Section 4. Information about Donations to the Project Gutenberg Literary Archive Foundation

Project Gutenberg-tm depends upon and cannot survive without wide spread public support and donations to carry out its mission of increasing the number of public domain and licensed works that can be freely distributed in machine readable form accessible by the widest array of equipment including outdated equipment. Many small donations (\$1 to \$5,000) are particularly important to maintaining tax exempt status with the IRS.

The Foundation is committed to complying with the laws regulating charities and charitable donations in all 50 states of the United States. Compliance requirements are not uniform and it takes a considerable effort, much paperwork and many fees to meet and keep up with these requirements. We do not solicit donations in locations where we have not received written confirmation of compliance. To SEND DONATIONS or determine the status of compliance for any particular state visit <http://pglaf.org>

While we cannot and do not solicit contributions from states where we have not met the solicitation requirements, we know of no prohibition against accepting unsolicited donations from donors in such states who approach us with offers to donate.

International donations are gratefully accepted, but we cannot make any statements concerning tax treatment of donations received from outside the United States. U.S. laws alone swamp our small staff.

Please check the Project Gutenberg Web pages for current donation methods and addresses. Donations are accepted in a number of other ways including checks, online payments and credit card donations. To donate, please visit: <http://pglaf.org/donate>

Section 5. General Information About Project Gutenberg-tm electronic works.

Professor Michael S. Hart is the originator of the Project Gutenberg-tm concept of a library of electronic works that could be freely shared with anyone. For thirty years, he produced and distributed Project Gutenberg-tm eBooks with only a loose network of volunteer support.

Project Gutenberg-tm eBooks are often created from several printed

editions, all of which are confirmed as Public Domain in the U.S. unless a copyright notice is included. Thus, we do not necessarily keep eBooks in compliance with any particular paper edition.

Most people start at our Web site which has the main PG search facility:

<http://www.gutenberg.org>

This Web site includes information about Project Gutenberg-tm, including how to make donations to the Project Gutenberg Literary Archive Foundation, how to help produce our new eBooks, and how to subscribe to our email newsletter to hear about new eBooks.

*** START OF THE PROJECT GUTENBERG EBOOK, WAR AND PEACE ***

War and Peace

by Leo Tolstoy/Tolstoi

BOOK ONE: 1805

CHAPTER I

"Well, Prince, so Genoa and Lucca are now just family estates of the Buonapartes. But I warn you, if you don't tell me that this means war, if you still try to defend the infamies and horrors perpetrated by that Antichrist--I really believe he is Antichrist--I will have nothing more to do with you and you are no longer my friend, no longer my 'faithful slave,' as you call yourself! But how do you do? I see I have frightened you--sit down and tell me all the news."

It was in July, 1805, and the speaker was the well-known Anna Pavlovna Scherer, maid of honor and favorite of the Empress Marya Fedorovna. With these words she greeted Prince Vasili Kuragin, a man of high rank and importance, who was the first to arrive at her reception. Anna Pavlovna had had a cough for some days. She was, as she said, suffering from la grippe; grippe being then a new word in St. Petersburg, used only by the elite.

All her invitations without exception, written in French, and delivered by a scarlet-liveried footman that morning, ran as follows:

"If you have nothing better to do, Count [or Prince], and if the prospect of spending an evening with a poor invalid is not too terrible, I shall be very charmed to see you tonight between 7 and 10- Annette Scherer."

"Heavens! what a virulent attack!" replied the prince, not in the least disconcerted by this reception. He had just entered, wearing an embroidered court uniform, knee breeches, and shoes, and had stars on his breast and a serene expression on his flat face. He spoke in that refined French in which our grandfathers not only spoke but thought, and with the gentle, patronizing intonation natural to a man of importance who had grown old in society and at court. He went up to Anna Pavlovna, kissed her hand, presenting to her his bald, scented, and shining head, and complacently seated himself on the sofa.

"First of all, dear friend, tell me how you are. Set your friend's mind at rest," said he without altering his tone, beneath the politeness and affected sympathy of which indifference and even irony could be discerned.

"Can one be well while suffering morally? Can one be calm in times like these if one has any feeling?" said Anna Pavlovna. "You are staying the whole evening, I hope?"

"And the fete at the English ambassador's? Today is Wednesday. I must put in an appearance there," said the prince. "My daughter is coming for me to take me there."

"I thought today's fete had been canceled. I confess all these festivities and fireworks are becoming wearisome."

"If they had known that you wished it, the entertainment would have been put off," said the prince, who, like a wound-up clock, by force of habit said things he did not even wish to be believed.

"Don't tease! Well, and what has been decided about Novosiltsev's dispatch? You know everything."

"What can one say about it?" replied the prince in a cold, listless tone. "What has been decided? They have decided that Buonaparte has burnt his boats, and I believe that we are ready to burn ours."

Prince Vasili always spoke languidly, like an actor repeating a stale part. Anna Pavlovna Scherer on the contrary, despite her forty years, overflowed with animation and impulsiveness. To be an enthusiast had become her social vocation and, sometimes even when she did not feel like it, she became enthusiastic in order not to disappoint the expectations of those who knew her. The subdued smile which, though it did not suit her faded features, always played round her lips expressed, as in a spoiled child, a continual consciousness of her charming defect, which she neither wished, nor could, nor considered it necessary, to correct.

In the midst of a conversation on political matters Anna Pavlovna burst out:

"Oh, don't speak to me of Austria. Perhaps I don't understand things, but Austria never has wished, and does not wish, for war. She is betraying us! Russia alone must save Europe. Our gracious sovereign recognizes his high vocation and will be true to it. That is the one thing I have faith in! Our good and wonderful sovereign has to perform the noblest role on earth, and he is so virtuous and noble that God will not forsake him. He will fulfill his vocation and crush the hydra of revolution, which has become more terrible than ever in the person of this murderer and villain! We alone must avenge the blood of the just one.... Whom, I ask you, can we rely on?... England with her commercial spirit will not and cannot understand the Emperor Alexander's loftiness of soul. She has refused to evacuate Malta. She wanted to find, and still seeks, some secret motive in our actions. What answer did Novosiltsev get? None. The English have not understood and cannot understand the self-abnegation of our Emperor who wants nothing for himself, but only desires the good of mankind. And what have they promised? Nothing! And what little they have promised they will not perform! Prussia has always declared that Buonaparte is invincible, and that all Europe is powerless before him.... And I don't believe a word that Hardenburg says, or Haugwitz either. This famous Prussian neutrality is just a trap. I have faith only in God and the lofty destiny of our adored monarch. He will save Europe!"

She suddenly paused, smiling at her own impetuosity.

"I think," said the prince with a smile, "that if you had been sent instead of our dear Wintzingerode you would have captured the King of Prussia's consent by assault. You are so eloquent. Will you give me a cup of tea?"

"In a moment. A propos," she added, becoming calm again, "I am expecting two very interesting men tonight, le Vicomte de Mortemart, who is connected with the Montmorencys through the Rohans, one of the best French families. He is one of the genuine emigres, the good ones. And also the Abbe Morio. Do you know that profound thinker? He has been received by the Emperor. Had you heard?"

"I shall be delighted to meet them," said the prince. "But tell me," he added with studied carelessness as if it had only just occurred to him, though the question he was about to ask was the chief motive of his visit, "is it true that the Dowager Empress wants Baron Funke to be appointed first secretary at Vienna? The baron by all accounts is a poor creature."

Prince Vasili wished to obtain this post for his son, but others were trying through the Dowager Empress Marya Fedorovna to secure it for the baron.

Anna Pavlovna almost closed her eyes to indicate that neither she nor anyone else had a right to criticize what the Empress desired or

was pleased with.

"Baron Funke has been recommended to the Dowager Empress by her sister," was all she said, in a dry and mournful tone.

As she named the Empress, Anna Pavlovna's face suddenly assumed an expression of profound and sincere devotion and respect mingled with sadness, and this occurred every time she mentioned her illustrious patroness. She added that Her Majesty had deigned to show Baron Funke beaucoup d'estime, and again her face clouded over with sadness.

The prince was silent and looked indifferent. But, with the womanly and courtierlike quickness and tact habitual to her, Anna Pavlovna wished both to rebuke him (for daring to speak he had done of a man recommended to the Empress) and at the same time to console him, so she said:

"Now about your family. Do you know that since your daughter came out everyone has been enraptured by her? They say she is amazingly beautiful."

The prince bowed to signify his respect and gratitude.

"I often think," she continued after a short pause, drawing nearer to the prince and smiling amiably at him as if to show that political and social topics were ended and the time had come for intimate conversation--"I often think how unfairly sometimes the joys of life are distributed. Why has fate given you two such splendid children? I don't speak of Anatole, your youngest. I don't like him," she added in a tone admitting of no rejoinder and raising her eyebrows. "Two such charming children. And really you appreciate them less than anyone, and so you don't deserve to have them."

And she smiled her ecstatic smile.

"I can't help it," said the prince. "Lavater would have said I lack the bump of paternity."

"Don't joke; I mean to have a serious talk with you. Do you know I am dissatisfied with your younger son? Between ourselves" (and her face assumed its melancholy expression), "he was mentioned at Her Majesty's and you were pitied...."

The prince answered nothing, but she looked at him significantly, awaiting a reply. He frowned.

"What would you have me do?" he said at last. "You know I did all a father could for their education, and they have both turned out fools. Hippolyte is at least a quiet fool, but Anatole is an active one. That is the only difference between them." He said this smiling in a way more natural and animated than usual, so that the wrinkles round his mouth very clearly revealed something unexpectedly coarse and unpleasant.

"And why are children born to such men as you? If you were not a father there would be nothing I could reproach you with," said Anna Pavlovna, looking up pensively.

"I am your faithful slave and to you alone I can confess that my children are the bane of my life. It is the cross I have to bear. That is how I explain it to myself. It can't be helped!"

He said no more, but expressed his resignation to cruel fate by a gesture. Anna Pavlovna meditated.

"Have you never thought of marrying your prodigal son Anatole?" she asked. "They say old maids have a mania for matchmaking, and though I don't feel that weakness in myself as yet, I know a little person who is very unhappy with her father. She is a relation of yours, Princess Mary Bolkonskaya."

Prince Vasili did not reply, though, with the quickness of memory and perception befitting a man of the world, he indicated by a movement of the head that he was considering this information.

"Do you know," he said at last, evidently unable to check the sad current of his thoughts, "that Anatole is costing me forty thousand rubles a year? And," he went on after a pause, "what will it be in five years, if he goes on like this?" Presently he added: "That's what we fathers have to put up with.... Is this princess of yours rich?"

"Her father is very rich and stingy. He lives in the country. He is the well-known Prince Bolkonski who had to retire from the army under the late Emperor, and was nicknamed 'the King of Prussia.' He is very clever but eccentric, and a bore. The poor girl is very unhappy. She has a brother; I think you know him, he married Lise Meinen lately. He is an aide-de-camp of Kutuzov's and will be here tonight."

"Listen, dear Annette," said the prince, suddenly taking Anna Pavlovna's hand and for some reason drawing it downwards. "Arrange that affair for me and I shall always be your most devoted slave-slave with an f, as a village elder of mine writes in his reports. She is rich and of good family and that's all I want."

And with the familiarity and easy grace peculiar to him, he raised the maid of honor's hand to his lips, kissed it, and swung it to and fro as he lay back in his armchair, looking in another direction.

"Attendez," said Anna Pavlovna, reflecting, "I'll speak to Lise, young Bolkonski's wife, this very evening, and perhaps the thing can be arranged. It shall be on your family's behalf that I'll start my apprenticeship as old maid."

CHAPTER II

Anna Pavlovna's drawing room was gradually filling. The highest Petersburg society was assembled there: people differing widely in age and character but alike in the social circle to which they belonged. Prince Vasili's daughter, the beautiful Helene, came to take her father to the ambassador's entertainment; she wore a ball dress and her badge as maid of honor. The youthful little Princess Bolkonskaya, known as la femme la plus seduisante de Petersbourg,* was also there. She had been married during the previous winter, and being pregnant did not go to any large gatherings, but only to small receptions. Prince Vasili's son, Hippolyte, had come with Mortemart, whom he introduced. The Abbe Morio and many others had also come.

*The most fascinating woman in Petersburg.

To each new arrival Anna Pavlovna said, "You have not yet seen my aunt," or "You do not know my aunt?" and very gravely conducted him or her to a little old lady, wearing large bows of ribbon in her cap, who had come sailing in from another room as soon as the guests began to arrive; and slowly turning her eyes from the visitor to her aunt, Anna Pavlovna mentioned each one's name and then left them.

Each visitor performed the ceremony of greeting this old aunt whom not one of them knew, not one of them wanted to know, and not one of them cared about; Anna Pavlovna observed these greetings with mournful and solemn interest and silent approval. The aunt spoke to each of them in the same words, about their health and her own, and the health of Her Majesty, "who, thank God, was better today." And each

visitor, though politeness prevented his showing impatience, left the old woman with a sense of relief at having performed a vexatious duty and did not return to her the whole evening.

The young Princess Bolkonskaya had brought some work in a gold-embroidered velvet bag. Her pretty little upper lip, on which a delicate dark down was just perceptible, was too short for her teeth, but it lifted all the more sweetly, and was especially charming when she occasionally drew it down to meet the lower lip. As is always the case with a thoroughly attractive woman, her defect--the shortness of her upper lip and her half-open mouth--seemed to be her own special and peculiar form of beauty. Everyone brightened at the sight of this pretty young woman, so soon to become a mother, so full of life and health, and carrying her burden so lightly. Old men and dull dispirited young ones who looked at her, after being in her company and talking to her a little while, felt as if they too were becoming, like her, full of life and health. All who talked to her, and at each word saw her bright smile and the constant gleam of her white teeth, thought that they were in a specially amiable mood that day.

The little princess went round the table with quick, short, swaying steps, her workbag on her arm, and gaily spreading out her dress sat down on a sofa near the silver samovar, as if all she was doing was a pleasure to herself and to all around her. "I have brought my work," said she in French, displaying her bag and addressing all present. "Mind, Annette, I hope you have not played a wicked trick on me," she added, turning to her hostess. "You wrote that it was to be quite a small reception, and just see how badly I am dressed." And she spread out her arms to show her short-waisted, lace-trimmed, dainty gray dress, girdled with a broad ribbon just below the breast.

"Soyez tranquille, Lise, you will always be prettier than anyone else," replied Anna Pavlovna.

"You know," said the princess in the same tone of voice and still in French, turning to a general, "my husband is deserting me? He is going to get himself killed. Tell me what this wretched war is for?" she added, addressing Prince Vasili, and without waiting for an answer she turned to speak to his daughter, the beautiful Helene.

"What a delightful woman this little princess is!" said Prince Vasili to Anna Pavlovna.

One of the next arrivals was a stout, heavily built young man with close-cropped hair, spectacles, the light-colored breeches fashionable at that time, a very high ruffle, and a brown dress coat. This stout young man was an illegitimate son of Count Bezukhov, a well-known grandee of Catherine's time who now lay dying in Moscow. The young man had not yet entered either the military or civil service, as he had only just returned from abroad where he had been educated, and this was his first appearance in society. Anna Pavlovna greeted him with the nod she accorded to the lowest hierarchy in her drawing room. But in spite of this lowest-grade greeting, a look of anxiety and fear, as at the sight of something too large and unsuited to the place, came over her face when she saw Pierre enter. Though he was certainly rather bigger than the other men in the room, her anxiety could only have reference to the clever though shy, but observant and natural, expression which distinguished him from everyone else in that drawing room.

"It is very good of you, Monsieur Pierre, to come and visit a poor invalid," said Anna Pavlovna, exchanging an alarmed glance with her aunt as she conducted him to her.

Pierre murmured something unintelligible, and continued to look round as if in search of something. On his way to the aunt he bowed to the little princess with a pleased smile, as to an intimate acquaintance.

Anna Pavlovna's alarm was justified, for Pierre turned away from the aunt without waiting to hear her speech about Her Majesty's health. Anna Pavlovna in dismay detained him with the words: "Do you know the Abbe Morio? He is a most interesting man."

"Yes, I have heard of his scheme for perpetual peace, and it is very interesting but hardly feasible."

"You think so?" rejoined Anna Pavlovna in order to say something and get away to attend to her duties as hostess. But Pierre now committed a reverse act of impoliteness. First he had left a lady before she had finished speaking to him, and now he continued to speak to another who wished to get away. With his head bent, and his big feet spread apart, he began explaining his reasons for thinking the abbe's plan chimerical.

"We will talk of it later," said Anna Pavlovna with a smile.

And having got rid of this young man who did not know how to behave, she resumed her duties as hostess and continued to listen and watch, ready to help at any point where the conversation might happen to flag. As the foreman of a spinning mill, when he has set the hands to work, goes round and notices here a spindle that has stopped or there one that creaks or makes more noise than it should, and hastens to check the machine or set it in proper motion, so Anna Pavlovna moved about her drawing room, approaching now a silent, now a too-noisy group, and by a word or slight rearrangement kept the conversational machine in steady, proper, and regular motion. But amid these cares her anxiety about Pierre was evident. She kept an anxious watch on him when he approached the group round Mortemart to listen to what was being said there, and again when he passed to another group whose center was the abbe.

Pierre had been educated abroad, and this reception at Anna Pavlovna's was the first he had attended in Russia. He knew that all the intellectual lights of Petersburg were gathered there and, like a child in a toyshop, did not know which way to look, afraid of missing any clever conversation that was to be heard. Seeing the self-confident and refined expression on the faces of those present he was always expecting to hear something very profound. At last he came up to Morio. Here the conversation seemed interesting and he stood waiting for an opportunity to express his own views, as young people are fond of doing.

CHAPTER III

Anna Pavlovna's reception was in full swing. The spindles hummed steadily and ceaselessly on all sides. With the exception of the aunt, beside whom sat only one elderly lady, who with her thin careworn face was rather out of place in this brilliant society, the whole company had settled into three groups. One, chiefly masculine, had formed round the abbe. Another, of young people, was grouped round the beautiful Princess Helene, Prince Vasili's daughter, and the little Princess Bolkonskaya, very pretty and rosy, though rather too plump for her age. The third group was gathered round Mortemart and Anna Pavlovna.

The vicomte was a nice-looking young man with soft features and polished manners, who evidently considered himself a celebrity but out of politeness modestly placed himself at the disposal of the circle in which he found himself. Anna Pavlovna was obviously serving him up as a treat to her guests. As a clever maitre d'hotel serves up as a specially choice delicacy a piece of meat that no one who had seen it in the kitchen would have cared to eat, so Anna Pavlovna served up to her guests, first the vicomte and then the abbe, as peculiarly choice morsels. The group about Mortemart immediately began discussing

the murder of the Duc d'Enghien. The vicomte said that the Duc d'Enghien had perished by his own magnanimity, and that there were particular reasons for Buonaparte's hatred of him.

"Ah, yes! Do tell us all about it, Vicomte," said Anna Pavlovna, with a pleasant feeling that there was something a la Louis XV in the sound of that sentence: "Contez nous cela, Vicomte."

The vicomte bowed and smiled courteously in token of his willingness to comply. Anna Pavlovna arranged a group round him, inviting everyone to listen to his tale.

"The vicomte knew the duc personally," whispered Anna Pavlovna to one of the guests. "The vicomte is a wonderful raconteur," said she to another. "How evidently he belongs to the best society," said she to a third; and the vicomte was served up to the company in the choicest and most advantageous style, like a well-garnished joint of roast beef on a hot dish.

The vicomte wished to begin his story and gave a subtle smile.

"Come over here, Helene, dear," said Anna Pavlovna to the beautiful young princess who was sitting some way off, the center of another group.

The princess smiled. She rose with the same unchanging smile with which she had first entered the room--the smile of a perfectly beautiful woman. With a slight rustle of her white dress trimmed with moss and ivy, with a gleam of white shoulders, glossy hair, and sparkling diamonds, she passed between the men who made way for her, not looking at any of them but smiling on all, as if graciously allowing each the privilege of admiring her beautiful figure and shapely shoulders, back, and bosom--which in the fashion of those days were very much exposed--and she seemed to bring the glamour of a ballroom with her as she moved toward Anna Pavlovna. Helene was so lovely that not only did she not show any trace of coquetry, but on the contrary she even appeared shy of her unquestionable and all too victorious beauty. She seemed to wish, but to be unable, to diminish its effect.

"How lovely!" said everyone who saw her; and the vicomte lifted his shoulders and dropped his eyes as if startled by something extraordinary when she took her seat opposite and beamed upon him also with her unchanging smile.

"Madame, I doubt my ability before such an audience," said he, smilingly inclining his head.

The princess rested her bare round arm on a little table and considered a reply unnecessary. She smilingly waited. All the time the story was being told she sat upright, glancing now at her beautiful round arm, altered in shape by its pressure on the table, now at her still more beautiful bosom, on which she readjusted a diamond necklace. From time to time she smoothed the folds of her dress, and whenever the story produced an effect she glanced at Anna Pavlovna, at once adopted just the expression she saw on the maid of honor's face, and again relapsed into her radiant smile.

The little princess had also left the tea table and followed Helene.

"Wait a moment, I'll get my work.... Now then, what are you thinking of?" she went on, turning to Prince Hippolyte. "Fetch me my workbag."

There was a general movement as the princess, smiling and talking merrily to everyone at once, sat down and gaily arranged herself in her seat.

"Now I am all right," she said, and asking the vicomte to begin, she took up her work.

Prince Hippolyte, having brought the workbag, joined the circle and moving a chair close to hers seated himself beside her.

Le charmant Hippolyte was surprising by his extraordinary resemblance to his beautiful sister, but yet more by the fact that in spite of this resemblance he was exceedingly ugly. His features were like his sister's, but while in her case everything was lit up by a joyous, self-satisfied, youthful, and constant smile of animation, and by the wonderful classic beauty of her figure, his face on the contrary was dulled by imbecility and a constant expression of sullen self-confidence, while his body was thin and weak. His eyes, nose, and mouth all seemed puckered into a vacant, wearied grimace, and his arms and legs always fell into unnatural positions.

"It's not going to be a ghost story?" said he, sitting down beside the princess and hastily adjusting his lorgnette, as if without this instrument he could not begin to speak.

"Why no, my dear fellow," said the astonished narrator, shrugging his shoulders.

"Because I hate ghost stories," said Prince Hippolyte in a tone which showed that he only understood the meaning of his words after he had uttered them.

He spoke with such self-confidence that his hearers could not be sure whether what he said was very witty or very stupid. He was dressed in a dark-green dress coat, knee breeches of the color of cuisse de nymphe effrayee, as he called it, shoes, and silk stockings.

The vicomte told his tale very neatly. It was an anecdote, then current, to the effect that the Duc d'Enghien had gone secretly to Paris to visit Mademoiselle George; that at her house he came upon Bonaparte, who also enjoyed the famous actress' favors, and that in his presence Napoleon happened to fall into one of the fainting fits to which he was subject, and was thus at the duc's mercy. The latter spared him, and this magnanimity Bonaparte subsequently repaid by death.

The story was very pretty and interesting, especially at the point where the rivals suddenly recognized one another; and the ladies looked agitated.

"Charming!" said Anna Pavlovna with an inquiring glance at the little princess.

"Charming!" whispered the little princess, sticking the needle into her work as if to testify that the interest and fascination of the story prevented her from going on with it.

The vicomte appreciated this silent praise and smiling gratefully prepared to continue, but just then Anna Pavlovna, who had kept a watchful eye on the young man who so alarmed her, noticed that he was talking too loudly and vehemently with the abbe, so she hurried to the rescue. Pierre had managed to start a conversation with the abbe about the balance of power, and the latter, evidently interested by the young man's simple-minded eagerness, was explaining his pet theory. Both were talking and listening too eagerly and too naturally, which was why Anna Pavlovna disapproved.

"The means are... the balance of power in Europe and the rights of the people," the abbe was saying. "It is only necessary for one powerful nation like Russia--barbaric as she is said to be--to place herself disinterestedly at the head of an alliance having for its object the maintenance of the balance of power of Europe, and it would save the world!"

"But how are you to get that balance?" Pierre was beginning.

At that moment Anna Pavlovna came up and, looking severely at

Pierre, asked the Italian how he stood Russian climate. The Italian's face instantly changed and assumed an offensively affected, sugary expression, evidently habitual to him when conversing with women.

"I am so enchanted by the brilliancy of the wit and culture of the society, more especially of the feminine society, in which I have had the honor of being received, that I have not yet had time to think of the climate," said he.

Not letting the abbe and Pierre escape, Anna Pavlovna, the more conveniently to keep them under observation, brought them into the larger circle.

CHAPTER IV

Just then another visitor entered the drawing room: Prince Andrew Bolkonski, the little princess' husband. He was a very handsome young man, of medium height, with firm, clearcut features. Everything about him, from his weary, bored expression to his quiet, measured step, offered a most striking contrast to his quiet, little wife. It was evident that he not only knew everyone in the drawing room, but had found them to be so tiresome that it wearied him to look at or listen to them. And among all these faces that he found so tedious, none seemed to bore him so much as that of his pretty wife. He turned away from her with a grimace that distorted his handsome face, kissed Anna Pavlovna's hand, and screwing up his eyes scanned the whole company.

"You are off to the war, Prince?" said Anna Pavlovna.

"General Kutuzov," said Bolkonski, speaking French and stressing the last syllable of the general's name like a Frenchman, "has been pleased to take me as an aide-de-camp...."

"And Lise, your wife?"

"She will go to the country."

"Are you not ashamed to deprive us of your charming wife?"

"Andre," said his wife, addressing her husband in the same coquettish manner in which she spoke to other men, "the vicomte has been telling us such a tale about Mademoiselle George and Buonaparte!"

Prince Andrew screwed up his eyes and turned away. Pierre, who from the moment Prince Andrew entered the room had watched him with glad, affectionate eyes, now came up and took his arm. Before he looked round Prince Andrew frowned again, expressing his annoyance with whoever was touching his arm, but when he saw Pierre's beaming face he gave him an unexpectedly kind and pleasant smile.

"There now!... So you, too, are in the great world?" said he to Pierre.

"I knew you would be here," replied Pierre. "I will come to supper with you. May I?" he added in a low voice so as not to disturb the vicomte who was continuing his story.

"No, impossible!" said Prince Andrew, laughing and pressing Pierre's hand to show that there was no need to ask the question. He wished to say something more, but at that moment Prince Vasili and his daughter got up to go and the two young men rose to let them pass.

"You must excuse me, dear Vicomte," said Prince Vasili to the

Frenchman, holding him down by the sleeve in a friendly way to prevent his rising. "This unfortunate fete at the ambassador's deprives me of a pleasure, and obliges me to interrupt you. I am very sorry to leave your enchanting party," said he, turning to Anna Pavlovna.

His daughter, Princess Helene, passed between the chairs, lightly holding up the folds of her dress, and the smile shone still more radiantly on her beautiful face. Pierre gazed at her with rapturous, almost frightened, eyes as she passed him.

"Very lovely," said Prince Andrew.

"Very," said Pierre.

In passing Prince Vasili seized Pierre's hand and said to Anna Pavlovna: "Educate this bear for me! He has been staying with me a whole month and this is the first time I have seen him in society. Nothing is so necessary for a young man as the society of clever women."

Anna Pavlovna smiled and promised to take Pierre in hand. She knew his father to be a connection of Prince Vasili's. The elderly lady who had been sitting with the old aunt rose hurriedly and overtook Prince Vasili in the anteroom. All the affectation of interest she had assumed had left her kindly and tearworn face and it now expressed only anxiety and fear.

"How about my son Boris, Prince?" said she, hurrying after him into the anteroom. "I can't remain any longer in Petersburg. Tell me what news I may take back to my poor boy."

Although Prince Vasili listened reluctantly and not very politely to the elderly lady, even betraying some impatience, she gave him an ingratiating and appealing smile, and took his hand that he might not go away.

"What would it cost you to say a word to the Emperor, and then he would be transferred to the Guards at once?" said she.

"Believe me, Princess, I am ready to do all I can," answered Prince Vasili, "but it is difficult for me to ask the Emperor. I should advise you to appeal to Rumyantsev through Prince Golitsyn. That would be the best way."

The elderly lady was a Princess Drubetskaya, belonging to one of the best families in Russia, but she was poor, and having long been out of society had lost her former influential connections. She had now come to Petersburg to procure an appointment in the Guards for her only son. It was, in fact, solely to meet Prince Vasili that she had obtained an invitation to Anna Pavlovna's reception and had sat listening to the vicomte's story. Prince Vasili's words frightened her, an embittered look clouded her once handsome face, but only for a moment; then she smiled again and clutched Prince Vasili's arm more tightly.

"Listen to me, Prince," said she. "I have never yet asked you for anything and I never will again, nor have I ever reminded you of my father's friendship for you; but now I entreat you for God's sake to do this for my son--and I shall always regard you as a benefactor," she added hurriedly. "No, don't be angry, but promise! I have asked Golitsyn and he has refused. Be the kindhearted man you always were," she said, trying to smile though tears were in her eyes.

"Papa, we shall be late," said Princess Helene, turning her beautiful head and looking over her classically molded shoulder as she stood waiting by the door.

Influence in society, however, is a capital which has to be

economized if it is to last. Prince Vasili knew this, and having once realized that if he asked on behalf of all who begged of him, he would soon be unable to ask for himself, he became chary of using his influence. But in Princess Drubetskaya's case he felt, after her second appeal, something like qualms of conscience. She had reminded him of what was quite true; he had been indebted to her father for the first steps in his career. Moreover, he could see by her manners that she was one of those women--mostly mothers--who, having once made up their minds, will not rest until they have gained their end, and are prepared if necessary to go on insisting day after day and hour after hour, and even to make scenes. This last consideration moved him.

"My dear Anna Mikhaylovna," said he with his usual familiarity and weariness of tone, "it is almost impossible for me to do what you ask; but to prove my devotion to you and how I respect your father's memory, I will do the impossible--your son shall be transferred to the Guards. Here is my hand on it. Are you satisfied?"

"My dear benefactor! This is what I expected from you--I knew your kindness!" He turned to go.

"Wait--just a word! When he has been transferred to the Guards..." she faltered. "You are on good terms with Michael Ilarionovich Kutuzov... recommend Boris to him as adjutant! Then I shall be at rest, and then..."

Prince Vasili smiled.

"No, I won't promise that. You don't know how Kutuzov is pestered since his appointment as Commander in Chief. He told me himself that all the Moscow ladies have conspired to give him all their sons as adjutants."

"No, but do promise! I won't let you go! My dear benefactor..."

"Papa," said his beautiful daughter in the same tone as before, "we shall be late."

"Well, au revoir! Good-by! You hear her?"

"Then tomorrow you will speak to the Emperor?"

"Certainly; but about Kutuzov, I don't promise."

"Do promise, do promise, Vasili!" cried Anna Mikhaylovna as he went, with the smile of a coquettish girl, which at one time probably came naturally to her, but was now very ill-suited to her careworn face.

Apparently she had forgotten her age and by force of habit employed all the old feminine arts. But as soon as the prince had gone her face resumed its former cold, artificial expression. She returned to the group where the vicomte was still talking, and again pretended to listen, while waiting till it would be time to leave. Her task was accomplished.

CHAPTER V

"And what do you think of this latest comedy, the coronation at Milan?" asked Anna Pavlovna, "and of the comedy of the people of Genoa and Lucca laying their petitions before Monsieur Buonaparte, and Monsieur Buonaparte sitting on a throne and granting the petitions of the nations? Adorable! It is enough to make one's head whirl! It is as if the whole world had gone crazy."

Prince Andrew looked Anna Pavlovna straight in the face with a sarcastic smile.

"'Dieu me la donne, gare a qui la touche!'"* They say he was very fine when he said that," he remarked, repeating the words in Italian: "'Dio mi l'ha dato. Guai a chi la tocchi!'"

*God has given it to me, let him who touches it beware!

"I hope this will prove the last drop that will make the glass run over," Anna Pavlovna continued. "The sovereigns will not be able to endure this man who is a menace to everything."

"The sovereigns? I do not speak of Russia," said the vicomte, polite but hopeless: "The sovereigns, madame... What have they done for Louis XVII, for the Queen, or for Madame Elizabeth? Nothing!" and he became more animated. "And believe me, they are reaping the reward of their betrayal of the Bourbon cause. The sovereigns! Why, they are sending ambassadors to compliment the usurper."

And sighing disdainfully, he again changed his position.

Prince Hippolyte, who had been gazing at the vicomte for some time through his lorgnette, suddenly turned completely round toward the little princess, and having asked for a needle began tracing the Conde coat of arms on the table. He explained this to her with as much gravity as if she had asked him to do it.

"Baton de gueules, engrele de gueules d' azur--maison Conde," said he.

The princess listened, smiling.

"If Buonaparte remains on the throne of France a year longer," the vicomte continued, with the air of a man who, in a matter with which he is better acquainted than anyone else, does not listen to others but follows the current of his own thoughts, "things will have gone too far. By intrigues, violence, exile, and executions, French society--I mean good French society--will have been forever destroyed, and then..."

He shrugged his shoulders and spread out his hands. Pierre wished to make a remark, for the conversation interested him, but Anna Pavlovna, who had him under observation, interrupted:

"The Emperor Alexander," said she, with the melancholy which always accompanied any reference of hers to the Imperial family,

"has declared that he will leave it to the French people themselves to choose their own form of government; and I believe that once free from the usurper, the whole nation will certainly throw itself into the arms of its rightful king," she concluded, trying to be amiable to the royalist emigrant.

"That is doubtful," said Prince Andrew. "Monsieur le Vicomte quite rightly supposes that matters have already gone too far. I think it will be difficult to return to the old regime."

"From what I have heard," said Pierre, blushing and breaking into the conversation, "almost all the aristocracy has already gone over to Bonaparte's side."

"It is the Buonapartists who say that," replied the vicomte without looking at Pierre. "At the present time it is difficult to know the real state of French public opinion."

"Bonaparte has said so," remarked Prince Andrew with a sarcastic smile.

It was evident that he did not like the vicomte and was aiming his remarks at him, though without looking at him.

"'I showed them the path to glory, but they did not follow it,'" Prince Andrew continued after a short silence, again quoting Napoleon's words. "'I opened my antechambers and they crowded in.' I do not know how far he was justified in saying so."

"Not in the least," replied the vicomte. "After the murder of the duc even the most partial ceased to regard him as a hero. If to some people," he went on, turning to Anna Pavlovna, "he ever was a hero, after the murder of the duc there was one martyr more in heaven and one hero less on earth."

Before Anna Pavlovna and the others had time to smile their appreciation of the vicomte's epigram, Pierre again broke into the conversation, and though Anna Pavlovna felt sure he would say something inappropriate, she was unable to stop him.

"The execution of the Duc d'Enghien," declared Monsieur Pierre, "was a political necessity, and it seems to me that Napoleon showed greatness of soul by not fearing to take on himself the whole responsibility of that deed."

"Dieu! Mon Dieu!" muttered Anna Pavlovna in a terrified whisper.

"What, Monsieur Pierre... Do you consider that assassination shows greatness of soul?" said the little princess, smiling and drawing her work nearer to her.

"Oh! Oh!" exclaimed several voices.

"Capital!" said Prince Hippolyte in English, and began slapping his knee with the palm of his hand.

The vicomte merely shrugged his shoulders. Pierre looked solemnly at his audience over his spectacles and continued.

"I say so," he continued desperately, "because the Bourbons fled from the Revolution leaving the people to anarchy, and Napoleon alone understood the Revolution and quelled it, and so for the general good, he could not stop short for the sake of one man's life."

"Won't you come over to the other table?" suggested Anna Pavlovna.

But Pierre continued his speech without heeding her.

"No," cried he, becoming more and more eager, "Napoleon is great because he rose superior to the Revolution, suppressed its abuses, preserved all that was good in it--equality of citizenship and freedom of speech and of the press--and only for that reason did he obtain power."

"Yes, if having obtained power, without availing himself of it to commit murder he had restored it to the rightful king, I should have called him a great man," remarked the vicomte.

"He could not do that. The people only gave him power that he might rid them of the Bourbons and because they saw that he was a great man. The Revolution was a grand thing!" continued Monsieur Pierre, betraying by this desperate and provocative proposition his extreme youth and his wish to express all that was in his mind.

"What? Revolution and regicide a grand thing?... Well, after that... But won't you come to this other table?" repeated Anna Pavlovna.

"Rousseau's *Contrat social*," said the vicomte with a tolerant smile.

"I am not speaking of regicide, I am speaking about ideas."

"Yes: ideas of robbery, murder, and regicide," again interjected an ironical voice.

"Those were extremes, no doubt, but they are not what is most important. What is important are the rights of man, emancipation from prejudices, and equality of citizenship, and all these ideas Napoleon has retained in full force."

"Liberty and equality," said the vicomte contemptuously, as if at last deciding seriously to prove to this youth how foolish his words were, "high-sounding words which have long been discredited. Who does not love liberty and equality? Even our Saviour preached liberty and equality. Have people since the Revolution become happier? On the contrary. We wanted liberty, but Buonaparte has destroyed it."

Prince Andrew kept looking with an amused smile from Pierre to the vicomte and from the vicomte to their hostess. In the first moment of Pierre's outburst Anna Pavlovna, despite her social experience, was horror-struck. But when she saw that Pierre's sacrilegious words had not exasperated the vicomte, and had convinced herself that it was impossible to stop him, she rallied her forces and joined the vicomte in a vigorous attack on the orator.

"But, my dear Monsieur Pierre," said she, "how do you explain the fact of a great man executing a duc--or even an ordinary man who--is innocent and untried?"

"I should like," said the vicomte, "to ask how monsieur explains the 18th Brumaire; was not that an imposture? It was a swindle, and not at all like the conduct of a great man!"

"And the prisoners he killed in Africa? That was horrible!" said the little princess, shrugging her shoulders.

"He's a low fellow, say what you will," remarked Prince Hippolyte.

Pierre, not knowing whom to answer, looked at them all and smiled. His smile was unlike the half-smile of other people. When he smiled, his grave, even rather gloomy, look was instantaneously replaced by another--a childlike, kindly, even rather silly look, which seemed to ask forgiveness.

The vicomte who was meeting him for the first time saw clearly that this young Jacobin was not so terrible as his words suggested. All were silent.

"How do you expect him to answer you all at once?" said Prince Andrew. "Besides, in the actions of a statesman one has to distinguish between his acts as a private person, as a general, and as an emperor. So it seems to me."

"Yes, yes, of course!" Pierre chimed in, pleased at the arrival of this reinforcement.

"One must admit," continued Prince Andrew, "that Napoleon as a man was great on the bridge of Arcola, and in the hospital at Jaffa where he gave his hand to the plague-stricken; but... but there are other acts which it is difficult to justify."

Prince Andrew, who had evidently wished to tone down the awkwardness of Pierre's remarks, rose and made a sign to his wife that it was time to go.

Suddenly Prince Hippolyte started up making signs to everyone to attend, and asking them all to be seated began:

"I was told a charming Moscow story today and must treat you to it. Excuse me, Vicomte--I must tell it in Russian or the point will be

lost...." And Prince Hippolyte began to tell his story in such Russian as a Frenchman would speak after spending about a year in Russia. Everyone waited, so emphatically and eagerly did he demand their attention to his story.

"There is in Moscow a lady, une dame, and she is very stingy. She must have two footmen behind her carriage, and very big ones. That was her taste. And she had a lady's maid, also big. She said..."

Here Prince Hippolyte paused, evidently collecting his ideas with difficulty.

"She said... Oh yes! She said, 'Girl,' to the maid, 'put on a livery, get up behind the carriage, and come with me while I make some calls.'"

Here Prince Hippolyte spluttered and burst out laughing long before his audience, which produced an effect unfavorable to the narrator. Several persons, among them the elderly lady and Anna Pavlovna, did however smile.

"She went. Suddenly there was a great wind. The girl lost her hat and her long hair came down...." Here he could contain himself no longer and went on, between gasps of laughter: "And the whole world knew...."

And so the anecdote ended. Though it was unintelligible why he had told it, or why it had to be told in Russian, still Anna Pavlovna and the others appreciated Prince Hippolyte's social tact in so agreeably ending Pierre's unpleasant and unamiable outburst. After the anecdote the conversation broke up into insignificant small talk about the last and next balls, about theatricals, and who would meet whom, and when and where.

CHAPTER VI

Having thanked Anna Pavlovna for her charming soiree, the guests began to take their leave.

Pierre was ungainly. Stout, about the average height, broad, with huge red hands; he did not know, as the saying is, how to enter a drawing room and still less how to leave one; that is, how to say something particularly agreeable before going away. Besides this he was absent-minded. When he rose to go, he took up instead of his own, the general's three-cornered hat, and held it, pulling at the plume, till the general asked him to restore it. All his absent-mindedness and inability to enter a room and converse in it was, however, redeemed by his kindly, simple, and modest expression. Anna Pavlovna turned toward him and, with a Christian mildness that expressed forgiveness of his indiscretion, nodded and said: "I hope to see you again, but I also hope you will change your opinions, my dear Monsieur Pierre."

When she said this, he did not reply and only bowed, but again everybody saw his smile, which said nothing, unless perhaps, "Opinions are opinions, but you see what a capital, good-natured fellow I am." And everyone, including Anna Pavlovna, felt this.

Prince Andrew had gone out into the hall, and, turning his shoulders to the footman who was helping him on with his cloak, listened indifferently to his wife's chatter with Prince Hippolyte who had also come into the hall. Prince Hippolyte stood close to the pretty, pregnant princess, and stared fixedly at her through his eyeglass.

"Go in, Annette, or you will catch cold," said the little

princess, taking leave of Anna Pavlovna. "It is settled," she added in a low voice.

Anna Pavlovna had already managed to speak to Lise about the match she contemplated between Anatole and the little princess' sister-in-law.

"I rely on you, my dear," said Anna Pavlovna, also in a low tone. "Write to her and let me know how her father looks at the matter. Au revoir!"--and she left the hall.

Prince Hippolyte approached the little princess and, bending his face close to her, began to whisper something.

Two footmen, the princess' and his own, stood holding a shawl and a cloak, waiting for the conversation to finish. They listened to the French sentences which to them were meaningless, with an air of understanding but not wishing to appear to do so. The princess as usual spoke smilingly and listened with a laugh.

"I am very glad I did not go to the ambassador's," said Prince Hippolyte "-so dull-. It has been a delightful evening, has it not? Delightful!"

"They say the ball will be very good," replied the princess, drawing up her downy little lip. "All the pretty women in society will be there."

"Not all, for you will not be there; not all," said Prince Hippolyte smiling joyfully; and snatching the shawl from the footman, whom he even pushed aside, he began wrapping it round the princess. Either from awkwardness or intentionally (no one could have said which) after the shawl had been adjusted he kept his arm around her for a long time, as though embracing her.

Still smiling, she gracefully moved away, turning and glancing at her husband. Prince Andrew's eyes were closed, so weary and sleepy did he seem.

"Are you ready?" he asked his wife, looking past her.

Prince Hippolyte hurriedly put on his cloak, which in the latest fashion reached to his very heels, and, stumbling in it, ran out into the porch following the princess, whom a footman was helping into the carriage.

"Princesse, au revoir," cried he, stumbling with his tongue as well as with his feet.

The princess, picking up her dress, was taking her seat in the dark carriage, her husband was adjusting his saber; Prince Hippolyte, under pretense of helping, was in everyone's way.

"Allow me, sir," said Prince Andrew in Russian in a cold, disagreeable tone to Prince Hippolyte who was blocking his path.

"I am expecting you, Pierre," said the same voice, but gently and affectionately.

The postilion started, the carriage wheels rattled. Prince Hippolyte laughed spasmodically as he stood in the porch waiting for the vicomte whom he had promised to take home.

"Well, mon cher," said the vicomte, having seated himself beside Hippolyte in the carriage, "your little princess is very nice, very nice indeed, quite French," and he kissed the tips of his fingers. Hippolyte burst out laughing.

"Do you know, you are a terrible chap for all your innocent airs," continued the vicomte. "I pity the poor husband, that little officer

who gives himself the airs of a monarch."

Hippolyte spluttered again, and amid his laughter said, "And you were saying that the Russian ladies are not equal to the French? One has to know how to deal with them."

Pierre reaching the house first went into Prince Andrew's study like one quite at home, and from habit immediately lay down on the sofa, took from the shelf the first book that came to his hand (it was Caesar's Commentaries), and resting on his elbow, began reading it in the middle.

"What have you done to Mlle Scherer? She will be quite ill now," said Prince Andrew, as he entered the study, rubbing his small white hands.

Pierre turned his whole body, making the sofa creak. He lifted his eager face to Prince Andrew, smiled, and waved his hand.

"That abbe is very interesting but he does not see the thing in the right light.... In my opinion perpetual peace is possible but--I do not know how to express it... not by a balance of political power...."

It was evident that Prince Andrew was not interested in such abstract conversation.

"One can't everywhere say all one thinks, mon cher. Well, have you at last decided on anything? Are you going to be a guardsman or a diplomatist?" asked Prince Andrew after a momentary silence.

Pierre sat up on the sofa, with his legs tucked under him.

"Really, I don't yet know. I don't like either the one or the other."

"But you must decide on something! Your father expects it."

Pierre at the age of ten had been sent abroad with an abbe as tutor, and had remained away till he was twenty. When he returned to Moscow his father dismissed the abbe and said to the young man, "Now go to Petersburg, look round, and choose your profession. I will agree to anything. Here is a letter to Prince Vasili, and here is money. Write to me all about it, and I will help you in everything." Pierre had already been choosing a career for three months, and had not decided on anything. It was about this choice that Prince Andrew was speaking. Pierre rubbed his forehead.

"But he must be a Freemason," said he, referring to the abbe whom he had met that evening.

"That is all nonsense." Prince Andrew again interrupted him, "let us talk business. Have you been to the Horse Guards?"

"No, I have not; but this is what I have been thinking and wanted to tell you. There is a war now against Napoleon. If it were a war for freedom I could understand it and should be the first to enter the army; but to help England and Austria against the greatest man in the world is not right."

Prince Andrew only shrugged his shoulders at Pierre's childish words. He put on the air of one who finds it impossible to reply to such nonsense, but it would in fact have been difficult to give any other answer than the one Prince Andrew gave to this naive question.

"If no one fought except on his own conviction, there would be no wars," he said.

"And that would be splendid," said Pierre.

Prince Andrew smiled ironically.

"Very likely it would be splendid, but it will never come about..."

"Well, why are you going to the war?" asked Pierre.

"What for? I don't know. I must. Besides that I am going..." He paused. "I am going because the life I am leading here does not suit me!"

CHAPTER VII

The rustle of a woman's dress was heard in the next room. Prince Andrew shook himself as if waking up, and his face assumed the look it had had in Anna Pavlovna's drawing room. Pierre removed his feet from the sofa. The princess came in. She had changed her gown for a house dress as fresh and elegant as the other. Prince Andrew rose and politely placed a chair for her.

"How is it," she began, as usual in French, settling down briskly and fussily in the easy chair, "how is it Annette never got married? How stupid you men all are not to have married her! Excuse me for saying so, but you have no sense about women. What an argumentative fellow you are, Monsieur Pierre!"

"And I am still arguing with your husband. I can't understand why he wants to go to the war," replied Pierre, addressing the princess with none of the embarrassment so commonly shown by young men in their intercourse with young women.

The princess started. Evidently Pierre's words touched her to the quick.

"Ah, that is just what I tell him!" said she. "I don't understand it; I don't in the least understand why men can't live without wars. How is it that we women don't want anything of the kind, don't need it? Now you shall judge between us. I always tell him: Here he is Uncle's aide-de-camp, a most brilliant position. He is so well known, so much appreciated by everyone. The other day at the Apraksins' I heard a lady asking, 'Is that the famous Prince Andrew?' I did indeed." She laughed. "He is so well received everywhere. He might easily become aide-de-camp to the Emperor. You know the Emperor spoke to him most graciously. Annette and I were speaking of how to arrange it. What do you think?"

Pierre looked at his friend and, noticing that he did not like the conversation, gave no reply.

"When are you starting?" he asked.

"Oh, don't speak of his going, don't! I won't hear it spoken of," said the princess in the same petulantly playful tone in which she had spoken to Hippolyte in the drawing room and which was so plainly ill-suited to the family circle of which Pierre was almost a member. "Today when I remembered that all these delightful associations must be broken off... and then you know, Andre..." (she looked significantly at her husband) "I'm afraid, I'm afraid!" she whispered, and a shudder ran down her back.

Her husband looked at her as if surprised to notice that someone besides Pierre and himself was in the room, and addressed her in a tone of frigid politeness.

"What is it you are afraid of, Lise? I don't understand," said he.

"There, what egotists men all are: all, all egotists! Just for a whim of his own, goodness only knows why, he leaves me and locks me up alone in the country."

"With my father and sister, remember," said Prince Andrew gently.

"Alone all the same, without my friends.... And he expects me not to be afraid."

Her tone was now querulous and her lip drawn up, giving her not a joyful, but an animal, squirrel-like expression. She paused as if she felt it indecorous to speak of her pregnancy before Pierre, though the gist of the matter lay in that.

"I still can't understand what you are afraid of," said Prince Andrew slowly, not taking his eyes off his wife.

The princess blushed, and raised her arms with a gesture of despair.

"No, Andrew, I must say you have changed. Oh, how you have..."

"Your doctor tells you to go to bed earlier," said Prince Andrew.
"You had better go."

The princess said nothing, but suddenly her short downy lip quivered. Prince Andrew rose, shrugged his shoulders, and walked about the room.

Pierre looked over his spectacles with naive surprise, now at him and now at her, moved as if about to rise too, but changed his mind.

"Why should I mind Monsieur Pierre being here?" exclaimed the little princess suddenly, her pretty face all at once distorted by a tearful grimace. "I have long wanted to ask you, Andrew, why you have changed so to me? What have I done to you? You are going to the war and have no pity for me. Why is it?"

"Lise!" was all Prince Andrew said. But that one word expressed an entreaty, a threat, and above all conviction that she would herself regret her words. But she went on hurriedly:

"You treat me like an invalid or a child. I see it all! Did you behave like that six months ago?"

"Lise, I beg you to desist," said Prince Andrew still more emphatically.

Pierre, who had been growing more and more agitated as he listened to all this, rose and approached the princess. He seemed unable to bear the sight of tears and was ready to cry himself.

"Calm yourself, Princess! It seems so to you because... I assure you I myself have experienced... and so... because... No, excuse me! An outsider is out of place here... No, don't distress yourself... Good-by!"

Prince Andrew caught him by the hand.

"No, wait, Pierre! The princess is too kind to wish to deprive me of the pleasure of spending the evening with you."

"No, he thinks only of himself," muttered the princess without restraining her angry tears.

"Lise!" said Prince Andrew dryly, raising his voice to the pitch which indicates that patience is exhausted.

Suddenly the angry, squirrel-like expression of the princess' pretty face changed into a winning and piteous look of fear. Her beautiful

eyes glanced askance at her husband's face, and her own assumed the timid, deprecating expression of a dog when it rapidly but feebly wags its drooping tail.

"Mon Dieu, mon Dieu!" she muttered, and lifting her dress with one hand she went up to her husband and kissed him on the forehead.

"Good night, Lise," said he, rising and courteously kissing her hand as he would have done to a stranger.

CHAPTER VIII

The friends were silent. Neither cared to begin talking. Pierre continually glanced at Prince Andrew; Prince Andrew rubbed his forehead with his small hand.

"Let us go and have supper," he said with a sigh, going to the door.

They entered the elegant, newly decorated, and luxurious dining room. Everything from the table napkins to the silver, china, and glass bore that imprint of newness found in the households of the newly married. Halfway through supper Prince Andrew leaned his elbows on the table and, with a look of nervous agitation such as Pierre had never before seen on his face, began to talk--as one who has long had something on his mind and suddenly determines to speak out.

"Never, never marry, my dear fellow! That's my advice: never marry till you can say to yourself that you have done all you are capable of, and until you have ceased to love the woman of your choice and have seen her plainly as she is, or else you will make a cruel and irrevocable mistake. Marry when you are old and good for nothing--or all that is good and noble in you will be lost. It will all be wasted on trifles. Yes! Yes! Yes! Don't look at me with such surprise. If you marry expecting anything from yourself in the future, you will feel at every step that for you all is ended, all is closed except the drawing room, where you will be ranged side by side with a court lackey and an idiot!... But what's the good?..." and he waved his arm.

Pierre took off his spectacles, which made his face seem different and the good-natured expression still more apparent, and gazed at his friend in amazement.

"My wife," continued Prince Andrew, "is an excellent woman, one of those rare women with whom a man's honor is safe; but, O God, what would I not give now to be unmarried! You are the first and only one to whom I mention this, because I like you."

As he said this Prince Andrew was less than ever like that Bolkonski who had lolled in Anna Pavlovna's easy chairs and with half-closed eyes had uttered French phrases between his teeth. Every muscle of his thin face was now quivering with nervous excitement; his eyes, in which the fire of life had seemed extinguished, now flashed with brilliant light. It was evident that the more lifeless he seemed at ordinary times, the more impassioned he became in these moments of almost morbid irritation.

"You don't understand why I say this," he continued, "but it is the whole story of life. You talk of Bonaparte and his career," said he (though Pierre had not mentioned Bonaparte), "but Bonaparte when he worked went step by step toward his goal. He was free, he had nothing but his aim to consider, and he reached it. But tie yourself up with a woman and, like a chained convict, you lose all freedom! And all you have of hope and strength merely weighs you down and

torments you with regret. Drawing rooms, gossip, balls, vanity, and triviality--these are the enchanted circle I cannot escape from. I am now going to the war, the greatest war there ever was, and I know nothing and am fit for nothing. I am very amiable and have a caustic wit," continued Prince Andrew, "and at Anna Pavlovna's they listen to me. And that stupid set without whom my wife cannot exist, and those women... If you only knew what those society women are, and women in general! My father is right. Selfish, vain, stupid, trivial in everything--that's what women are when you see them in their true colors! When you meet them in society it seems as if there were something in them, but there's nothing, nothing, nothing! No, don't marry, my dear fellow; don't marry!" concluded Prince Andrew.

"It seems funny to me," said Pierre, "that you, you should consider yourself incapable and your life a spoiled life. You have everything before you, everything. And you..."

He did not finish his sentence, but his tone showed how highly he thought of his friend and how much he expected of him in the future.

"How can he talk like that?" thought Pierre. He considered his friend a model of perfection because Prince Andrew possessed in the highest degree just the very qualities Pierre lacked, and which might be best described as strength of will. Pierre was always astonished at Prince Andrew's calm manner of treating everybody, his extraordinary memory, his extensive reading (he had read everything, knew everything, and had an opinion about everything), but above all at his capacity for work and study. And if Pierre was often struck by Andrew's lack of capacity for philosophical meditation (to which he himself was particularly addicted), he regarded even this not as a defect but as a sign of strength.

Even in the best, most friendly and simplest relations of life, praise and commendation are essential, just as grease is necessary to wheels that they may run smoothly.

"My part is played out," said Prince Andrew. "What's the use of talking about me? Let us talk about you," he added after a silence, smiling at his reassuring thoughts.

That smile was immediately reflected on Pierre's face.

"But what is there to say about me?" said Pierre, his face relaxing into a careless, merry smile. "What am I? An illegitimate son!" He suddenly blushed crimson, and it was plain that he had made a great effort to say this. "Without a name and without means... And it really..." But he did not say what "it really" was. "For the present I am free and am all right. Only I haven't the least idea what I am to do; I wanted to consult you seriously."

Prince Andrew looked kindly at him, yet his glance--friendly and affectionate as it was--expressed a sense of his own superiority.

"I am fond of you, especially as you are the one live man among our whole set. Yes, you're all right! Choose what you will; it's all the same. You'll be all right anywhere. But look here: give up visiting those Kuragins and leading that sort of life. It suits you so badly--all this debauchery, dissipation, and the rest of it!"

"What would you have, my dear fellow?" answered Pierre, shrugging his shoulders. "Women, my dear fellow; women!"

"I don't understand it," replied Prince Andrew. "Women who are *comme il faut*, that's a different matter; but the Kuragins' set of women, 'women and wine' I don't understand!"

Pierre was staying at Prince Vasili Kuragin's and sharing the dissipated life of his son Anatole, the son whom they were planning to reform by marrying him to Prince Andrew's sister.

"Do you know?" said Pierre, as if suddenly struck by a happy thought, "seriously, I have long been thinking of it.... Leading such a life I can't decide or think properly about anything. One's head aches, and one spends all one's money. He asked me for tonight, but I won't go."

"You give me your word of honor not to go?"

"On my honor!"

CHAPTER IX

It was past one o'clock when Pierre left his friend. It was a cloudless, northern, summer night. Pierre took an open cab intending to drive straight home. But the nearer he drew to the house the more he felt the impossibility of going to sleep on such a night. It was light enough to see a long way in the deserted street and it seemed more like morning or evening than night. On the way Pierre remembered that Anatole Kuragin was expecting the usual set for cards that evening, after which there was generally a drinking bout, finishing with visits of a kind Pierre was very fond of.

"I should like to go to Kuragin's," thought he.

But he immediately recalled his promise to Prince Andrew not to go there. Then, as happens to people of weak character, he desired so passionately once more to enjoy that dissipation he was so accustomed to that he decided to go. The thought immediately occurred to him that his promise to Prince Andrew was of no account, because before he gave it he had already promised Prince Anatole to come to his gathering; "besides," thought he, "all such 'words of honor' are conventional things with no definite meaning, especially if one considers that by tomorrow one may be dead, or something so extraordinary may happen to one that honor and dishonor will be all the same!" Pierre often indulged in reflections of this sort, nullifying all his decisions and intentions. He went to Kuragin's.

Reaching the large house near the Horse Guards' barracks, in which Anatole lived, Pierre entered the lighted porch, ascended the stairs, and went in at the open door. There was no one in the anteroom; empty bottles, cloaks, and overshoes were lying about; there was a smell of alcohol, and sounds of voices and shouting in the distance.

Cards and supper were over, but the visitors had not yet dispersed. Pierre threw off his cloak and entered the first room, in which were the remains of supper. A footman, thinking no one saw him, was drinking on the sly what was left in the glasses. From the third room came sounds of laughter, the shouting of familiar voices, the growling of a bear, and general commotion. Some eight or nine young men were crowding anxiously round an open window. Three others were romping with a young bear, one pulling him by the chain and trying to set him at the others.

"I bet a hundred on Stevens!" shouted one.

"Mind, no holding on!" cried another.

"I bet on Dolokhov!" cried a third. "Kuragin, you part our hands."

"There, leave Bruin alone; here's a bet on."

"At one draught, or he loses!" shouted a fourth.

"Jacob, bring a bottle!" shouted the host, a tall, handsome fellow

who stood in the midst of the group, without a coat, and with his fine linen shirt unfastened in front. "Wait a bit, you fellows.... Here is Petya! Good man!" cried he, addressing Pierre.

Another voice, from a man of medium height with clear blue eyes, particularly striking among all these drunken voices by its sober ring, cried from the window: "Come here; part the bets!" This was Dolokhov, an officer of the Semenov regiment, a notorious gambler and duelist, who was living with Anatole. Pierre smiled, looking about him merrily.

"I don't understand. What's it all about?"

"Wait a bit, he is not drunk yet! A bottle here," said Anatole, taking a glass from the table he went up to Pierre.

"First of all you must drink!"

Pierre drank one glass after another, looking from under his brows at the tipsy guests who were again crowding round the window, and listening to their chatter. Anatole kept on refilling Pierre's glass while explaining that Dolokhov was betting with Stevens, an English naval officer, that he would drink a bottle of rum sitting on the outer ledge of the third floor window with his legs hanging out.

"Go on, you must drink it all," said Anatole, giving Pierre the last glass, "or I won't let you go!"

"No, I won't," said Pierre, pushing Anatole aside, and he went up to the window.

Dolokhov was holding the Englishman's hand and clearly and distinctly repeating the terms of the bet, addressing himself particularly to Anatole and Pierre.

Dolokhov was of medium height, with curly hair and light-blue eyes. He was about twenty-five. Like all infantry officers he wore no mustache, so that his mouth, the most striking feature of his face, was clearly seen. The lines of that mouth were remarkably finely curved. The middle of the upper lip formed a sharp wedge and closed firmly on the firm lower one, and something like two distinct smiles played continually round the two corners of the mouth; this, together with the resolute, insolent intelligence of his eyes, produced an effect which made it impossible not to notice his face. Dolokhov was a man of small means and no connections. Yet, though Anatole spent tens of thousands of rubles, Dolokhov lived with him and had placed himself on such a footing that all who knew them, including Anatole himself, respected him more than they did Anatole. Dolokhov could play all games and nearly always won. However much he drank, he never lost his clearheadedness. Both Kuragin and Dolokhov were at that time notorious among the rakes and scapergaces of Petersburg.

The bottle of rum was brought. The window frame which prevented anyone from sitting on the outer sill was being forced out by two footmen, who were evidently flurried and intimidated by the directions and shouts of the gentlemen around.

Anatole with his swaggering air strode up to the window. He wanted to smash something. Pushing away the footmen he tugged at the frame, but could not move it. He smashed a pane.

"You have a try, Hercules," said he, turning to Pierre.

Pierre seized the crossbeam, tugged, and wrenched the oak frame out with a crash.

"Take it right out, or they'll think I'm holding on," said Dolokhov.

"Is the Englishman bragging?... Eh? Is it all right?" said Anatole.

"First-rate," said Pierre, looking at Dolokhov, who with a bottle of rum in his hand was approaching the window, from which the light of the sky, the dawn merging with the afterglow of sunset, was visible.

Dolokhov, the bottle of rum still in his hand, jumped onto the window sill. "Listen!" cried he, standing there and addressing those in the room. All were silent.

"I bet fifty imperials"--he spoke French that the Englishman might understand him, but he did, not speak it very well--"I bet fifty imperials... or do you wish to make it a hundred?" added he, addressing the Englishman.

"No, fifty," replied the latter.

"All right. Fifty imperials... that I will drink a whole bottle of rum without taking it from my mouth, sitting outside the window on this spot" (he stooped and pointed to the sloping ledge outside the window) "and without holding on to anything. Is that right?"

"Quite right," said the Englishman.

Anatole turned to the Englishman and taking him by one of the buttons of his coat and looking down at him--the Englishman was short--began repeating the terms of the wager to him in English.

"Wait!" cried Dolokhov, hammering with the bottle on the window sill to attract attention. "Wait a bit, Kuragin. Listen! If anyone else does the same, I will pay him a hundred imperials. Do you understand?"

The Englishman nodded, but gave no indication whether he intended to accept this challenge or not. Anatole did not release him, and though he kept nodding to show that he understood, Anatole went on translating Dolokhov's words into English. A thin young lad, an hussar of the Life Guards, who had been losing that evening, climbed on the window sill, leaned over, and looked down.

"Oh! Oh! Oh!" he muttered, looking down from the window at the stones of the pavement.

"Shut up!" cried Dolokhov, pushing him away from the window. The lad jumped awkwardly back into the room, tripping over his spurs.

Placing the bottle on the window sill where he could reach it easily, Dolokhov climbed carefully and slowly through the window and lowered his legs. Pressing against both sides of the window, he adjusted himself on his seat, lowered his hands, moved a little to the right and then to the left, and took up the bottle. Anatole brought two candles and placed them on the window sill, though it was already quite light. Dolokhov's back in his white shirt, and his curly head, were lit up from both sides. Everyone crowded to the window, the Englishman in front. Pierre stood smiling but silent. One man, older than the others present, suddenly pushed forward with a scared and angry look and wanted to seize hold of Dolokhov's shirt.

"I say, this is folly! He'll be killed," said this more sensible man.

Anatole stopped him.

"Don't touch him! You'll startle him and then he'll be killed. Eh?... What then?... Eh?"

Dolokhov turned round and, again holding on with both hands, arranged himself on his seat.

"If anyone comes meddling again," said he, emitting the words separately through his thin compressed lips, "I will throw him down there. Now then!"

Saying this he again turned round, dropped his hands, took the bottle and lifted it to his lips, threw back his head, and raised his free hand to balance himself. One of the footmen who had stooped to pick up some broken glass remained in that position without taking his eyes from the window and from Dolokhov's back. Anatole stood erect with staring eyes. The Englishman looked on sideways, pursing up his lips. The man who had wished to stop the affair ran to a corner of the room and threw himself on a sofa with his face to the wall. Pierre hid his face, from which a faint smile forgot to fade though his features now expressed horror and fear. All were still. Pierre took his hands from his eyes. Dolokhov still sat in the same position, only his head was thrown further back till his curly hair touched his shirt collar, and the hand holding the bottle was lifted higher and higher and trembled with the effort. The bottle was emptying perceptibly and rising still higher and his head tilting yet further back. "Why is it so long?" thought Pierre. It seemed to him that more than half an hour had elapsed. Suddenly Dolokhov made a backward movement with his spine, and his arm trembled nervously; this was sufficient to cause his whole body to slip as he sat on the sloping ledge. As he began slipping down, his head and arm wavered still more with the strain. One hand moved as if to clutch the window sill, but refrained from touching it. Pierre again covered his eyes and thought he would never never them again. Suddenly he was aware of a stir all around. He looked up: Dolokhov was standing on the window sill, with a pale but radiant face.

"It's empty."

He threw the bottle to the Englishman, who caught it neatly. Dolokhov jumped down. He smelt strongly of rum.

"Well done!... Fine fellow!... There's a bet for you!... Devil take you!" came from different sides.

The Englishman took out his purse and began counting out the money. Dolokhov stood frowning and did not speak. Pierre jumped upon the window sill.

"Gentlemen, who wishes to bet with me? I'll do the same thing!" he suddenly cried. "Even without a bet, there! Tell them to bring me a bottle. I'll do it.... Bring a bottle!"

"Let him do it, let him do it," said Dolokhov, smiling.

"What next? Have you gone mad?... No one would let you!... Why, you go giddy even on a staircase," exclaimed several voices.

"I'll drink it! Let's have a bottle of rum!" shouted Pierre, banging the table with a determined and drunken gesture and preparing to climb out of the window.

They seized him by his arms; but he was so strong that everyone who touched him was sent flying.

"No, you'll never manage him that way," said Anatole. "Wait a bit and I'll get round him.... Listen! I'll take your bet tomorrow, but now we are all going to ----'s."

"Come on then," cried Pierre. "Come on!... And we'll take Bruin with us."

And he caught the bear, took it in his arms, lifted it from the ground, and began dancing round the room with it.

CHAPTER X

Prince Vasili kept the promise he had given to Princess Drubetskaya who had spoken to him on behalf of her only son Boris on the evening of Anna Pavlovna's soiree. The matter was mentioned to the Emperor, an exception made, and Boris transferred into the regiment of Semenov Guards with the rank of cornet. He received, however, no appointment to Kutuzov's staff despite all Anna Mikhaylovna's endeavors and entreaties. Soon after Anna Pavlovna's reception Anna Mikhaylovna returned to Moscow and went straight to her rich relations, the Rostovs, with whom she stayed when in the town and where her darling Bory, who had only just entered a regiment of the line and was being at once transferred to the Guards as a cornet, had been educated from childhood and lived for years at a time. The Guards had already left Petersburg on the tenth of August, and her son, who had remained in Moscow for his equipment, was to join them on the march to Radzivilov.

It was St. Natalia's day and the name day of two of the Rostovs--the mother and the youngest daughter--both named Nataly. Ever since the morning, carriages with six horses had been coming and going continually, bringing visitors to the Countess Rostova's big house on the Povarskaya, so well known to all Moscow. The countess herself and her handsome eldest daughter were in the drawing-room with the visitors who came to congratulate, and who constantly succeeded one another in relays.

The countess was a woman of about forty-five, with a thin Oriental type of face, evidently worn out with childbearing--she had had twelve. A languor of motion and speech, resulting from weakness, gave her a distinguished air which inspired respect. Princess Anna

Mikhaylovna Drubetskaya, who as a member of the household was also seated in the drawing room, helped to receive and entertain the visitors. The young people were in one of the inner rooms, not considering it necessary to take part in receiving the visitors. The count met the guests and saw them off, inviting them all to dinner.

"I am very, very grateful to you, mon cher," or "ma chere"--he called everyone without exception and without the slightest variation in his tone, "my dear," whether they were above or below him in rank--"I thank you for myself and for our two dear ones whose name day we are keeping. But mind you come to dinner or I shall be offended, ma chere! On behalf of the whole family I beg you to come, mon cher!" These words he repeated to everyone without exception or variation, and with the same expression on his full, cheerful, clean-shaven face, the same firm pressure of the hand and the same quick, repeated bows. As soon as he had seen a visitor off he returned to one of those who were still in the drawing room, drew a chair toward him or her, and jauntily spreading out his legs and putting his hands on his knees with the air of a man who enjoys life and knows how to live, he swayed to and fro with dignity, offered surmises about the weather, or touched on questions of health, sometimes in Russian and sometimes in very bad but self-confident French; then again, like a man weary but unflinching in the fulfillment of duty, he rose to see some visitors off and, stroking his scanty gray hairs over his bald patch, also asked them to dinner. Sometimes on his way back from the anteroom he would pass through the conservatory and pantry into the large marble dining hall, where tables were being set out for eighty people; and looking at the footmen, who were bringing in silver and china, moving tables, and unfolding damask table linen, he would call Dmitri Vasilevich, a man of good family and the manager of all his affairs, and while looking with pleasure at the enormous table would say: "Well, Dmitri, you'll see that things are all as they should be? That's right! The great thing is the serving, that's it." And with a complacent sigh he would return to the drawing room.

"Marya Lvovna Karagina and her daughter!" announced the countess' gigantic footman in his bass voice, entering the drawing room. The countess reflected a moment and took a pinch from a gold snuffbox with her husband's portrait on it.

"I'm quite worn out by these callers. However, I'll see her and no more. She is so affected. Ask her in," she said to the footman in a sad voice, as if saying: "Very well, finish me off."

A tall, stout, and proud-looking woman, with a round-faced smiling daughter, entered the drawing room, their dresses rustling.

"Dear Countess, what an age... She has been laid up, poor child... at the Razumovski's ball... and Countess Apraksina... I was so delighted..." came the sounds of animated feminine voices, interrupting one another and mingling with the rustling of dresses and the scraping of chairs. Then one of those conversations began which last out until, at the first pause, the guests rise with a rustle of dresses and say, "I am so delighted... Mamma's health... and Countess Apraksina..." and then, again rustling, pass into the anteroom, put on cloaks or mantles, and drive away. The conversation was on the chief topic of the day: the illness of the wealthy and celebrated beau of Catherine's day, Count Bezukhov, and about his illegitimate son Pierre, the one who had behaved so improperly at Anna Pavlovna's reception.

"I am so sorry for the poor count," said the visitor. "He is in such bad health, and now this vexation about his son is enough to kill him!"

"What is that?" asked the countess as if she did not know what the visitor alluded to, though she had already heard about the cause of Count Bezukhov's distress some fifteen times.

"That's what comes of a modern education," exclaimed the visitor. "It seems that while he was abroad this young man was allowed to do as he liked, now in Petersburg I hear he has been doing such terrible things that he has been expelled by the police."

"You don't say so!" replied the countess.

"He chose his friends badly," interposed Anna Mikhaylovna. "Prince Vasili's son, he, and a certain Dolokhov have, it is said, been up to heaven only knows what! And they have had to suffer for it. Dolokhov has been degraded to the ranks and Bezukhov's son sent back to Moscow. Anatole Kuragin's father managed somehow to get his son's affair hushed up, but even he was ordered out of Petersburg."

"But what have they been up to?" asked the countess.

"They are regular brigands, especially Dolokhov," replied the visitor. "He is a son of Marya Ivanovna Dolokhova, such a worthy woman, but there, just fancy! Those three got hold of a bear somewhere, put it in a carriage, and set off with it to visit some actresses! The police tried to interfere, and what did the young men do? They tied a policeman and the bear back to back and put the bear into the Moyka Canal. And there was the bear swimming about with the policeman on his back!"

"What a nice figure the policeman must have cut, my dear!" shouted the count, dying with laughter.

"Oh, how dreadful! How can you laugh at it, Count?"

Yet the ladies themselves could not help laughing.

"It was all they could do to rescue the poor man," continued the visitor. "And to think it is Cyril Vladimirovich Bezukhov's son who amuses himself in this sensible manner! And he was said to be so well educated and clever. This is all that his foreign education has done for him! I hope that here in Moscow no one will receive him, in spite of his money. They wanted to introduce him to me, but I quite declined: I have my daughters to consider."

"Why do you say this young man is so rich?" asked the countess, turning away from the girls, who at once assumed an air of inattention. "His children are all illegitimate. I think Pierre also is illegitimate."

The visitor made a gesture with her hand.

"I should think he has a score of them."

Princess Anna Mikhaylovna intervened in the conversation, evidently wishing to show her connections and knowledge of what went on in society.

"The fact of the matter is," said she significantly, and also in a half whisper, "everyone knows Count Cyril's reputation.... He has lost count of his children, but this Pierre was his favorite."

"How handsome the old man still was only a year ago!" remarked the countess. "I have never seen a handsomer man."

"He is very much altered now," said Anna Mikhaylovna. "Well, as I was saying, Prince Vasili is the next heir through his wife, but the count is very fond of Pierre, looked after his education, and wrote to the Emperor about him; so that in the case of his death--and he is so ill that he may die at any moment, and Dr. Lorrain has come from Petersburg--no one knows who will inherit his immense fortune, Pierre or Prince Vasili. Forty thousand serfs and millions of rubles! I know it all very well for Prince Vasili told me himself. Besides, Cyril Vladimirovich is my mother's second cousin. He's also my Bory's godfather," she added, as if she attached no importance at all to the fact.

"Prince Vasili arrived in Moscow yesterday. I hear he has come on some inspection business," remarked the visitor.

"Yes, but between ourselves," said the princess, "that is a pretext. The fact is he has come to see Count Cyril Vladimirovich, hearing how ill he is."

"But do you know, my dear, that was a capital joke," said the count; and seeing that the elder visitor was not listening, he turned to the young ladies. "I can just imagine what a funny figure that policeman cut!"

And as he waved his arms to impersonate the policeman, his portly form again shook with a deep ringing laugh, the laugh of one who always eats well and, in particular, drinks well. "So do come and dine with us!" he said.

CHAPTER XI

Silence ensued. The countess looked at her callers, smiling affably, but not concealing the fact that she would not be distressed if they now rose and took their leave. The visitor's daughter was already smoothing down her dress with an inquiring look at her mother, when suddenly from the next room were heard the footsteps of boys and girls running to the door and the noise of a chair falling over, and a girl of thirteen, hiding something in the folds of her short muslin frock, darted in and stopped short in the middle of the room. It was evident that she had not intended her flight to bring her so far. Behind her in the doorway appeared a student with a crimson coat collar, an officer of the Guards, a girl of fifteen, and a plump rosy-faced boy in a short jacket.

The count jumped up and, swaying from side to side, spread his

arms wide and threw them round the little girl who had run in.

"Ah, here she is!" he exclaimed laughing. "My pet, whose name day it is. My dear pet!"

"Ma chere, there is a time for everything," said the countess with feigned severity. "You spoil her, Ilya," she added, turning to her husband.

"How do you do, my dear? I wish you many happy returns of your name day," said the visitor. "What a charming child," she added, addressing the mother.

This black-eyed, wide-mouthed girl, not pretty but full of life-with childish bare shoulders which after her run heaved and shook her bodice, with black curls tossed backward, thin bare arms, little legs in lace-frilled drawers, and feet in low slippers--was just at that charming age when a girl is no longer a child, though the child is not yet a young woman. Escaping from her father she ran to hide her flushed face in the lace of her mother's mantilla--not paying the least attention to her severe remark--and began to laugh. She laughed, and in fragmentary sentences tried to explain about a doll which she produced from the folds of her frock.

"Do you see?... My doll... Mimi... You see..." was all Natasha managed to utter (to her everything seemed funny). She leaned against her mother and burst into such a loud, ringing fit of laughter that even the prim visitor could not help joining in.

"Now then, go away and take your monstrosity with you," said the mother, pushing away her daughter with pretended sternness, and turning to the visitor she added: "She is my youngest girl."

Natasha, raising her face for a moment from her mother's mantilla, glanced up at her through tears of laughter, and again hid her face.

The visitor, compelled to look on at this family scene, thought it necessary to take some part in it.

"Tell me, my dear," said she to Natasha, "is Mimi a relation of yours? A daughter, I suppose?"

Natasha did not like the visitor's tone of condescension to childish things. She did not reply, but looked at her seriously.

Meanwhile the younger generation: Boris, the officer, Anna Mikhaylovna's son; Nicholas, the undergraduate, the count's eldest son; Sonya, the count's fifteen-year-old niece, and little Petya, his youngest boy, had all settled down in the drawing room and were obviously trying to restrain within the bounds of decorum the excitement and mirth that shone in all their faces. Evidently in the back rooms, from which they had dashed out so impetuously, the conversation had been more amusing than the drawing-room talk of society scandals, the weather, and Countess Apraksina. Now and then they glanced at one another, hardly able to suppress their laughter.

The two young men, the student and the officer, friends from childhood, were of the same age and both handsome fellows, though not alike. Boris was tall and fair, and his calm and handsome face had regular, delicate features. Nicholas was short with curly hair and an open expression. Dark hairs were already showing on his upper lip, and his whole face expressed impetuosity and enthusiasm. Nicholas blushed when he entered the drawing room. He evidently tried to find something to say, but failed. Boris on the contrary at once found his footing, and related quietly and humorously how he had known that doll Mimi when she was still quite a young lady, before her nose was broken; how she had aged during the five years he had known her, and how her head had cracked right across the skull. Having said this he glanced at Natasha. She turned away from him and glanced at her younger brother, who was screwing up his eyes and shaking with

suppressed laughter, and unable to control herself any longer, she jumped up and rushed from the room as fast as her nimble little feet would carry her. Boris did not laugh.

"You were meaning to go out, weren't you, Mamma? Do you want the carriage?" he asked his mother with a smile.

"Yes, yes, go and tell them to get it ready," she answered, returning his smile.

Boris quietly left the room and went in search of Natasha. The plump boy ran after them angrily, as if vexed that their program had been disturbed.

CHAPTER XII

The only young people remaining in the drawing room, not counting the young lady visitor and the countess' eldest daughter (who was four years older than her sister and behaved already like a grown-up person), were Nicholas and Sonya, the niece. Sonya was a slender little brunette with a tender look in her eyes which were veiled by long lashes, thick black plaits coiling twice round her head, and a tawny tint in her complexion and especially in the color of her slender but graceful and muscular arms and neck. By the grace of her movements, by the softness and flexibility of her small limbs, and by a certain coyness and reserve of manner, she reminded one of a pretty, half-grown kitten which promises to become a beautiful little cat. She evidently considered it proper to show an interest in the general conversation by smiling, but in spite of herself her eyes under their thick long lashes watched her cousin who was going to join the army, with such passionate girlish adoration that her smile could not for a single instant impose upon anyone, and it was clear that the kitten had settled down only to spring up with more energy and again play with her cousin as soon as they too could, like Natasha and Boris, escape from the drawing room.

"Ah yes, my dear," said the count, addressing the visitor and pointing to Nicholas, "his friend Boris has become an officer, and so for friendship's sake he is leaving the university and me, his old father, and entering the military service, my dear. And there was a place and everything waiting for him in the Archives Department! Isn't that friendship?" remarked the count in an inquiring tone.

"But they say that war has been declared," replied the visitor.

"They've been saying so a long while," said the count, "and they'll say so again and again, and that will be the end of it. My dear, there's friendship for you," he repeated. "He's joining the hussars."

The visitor, not knowing what to say, shook her head.

"It's not at all from friendship," declared Nicholas, flaring up and turning away as if from a shameful aspersion. "It is not from friendship at all; I simply feel that the army is my vocation."

He glanced at his cousin and the young lady visitor; and they were both regarding him with a smile of approbation.

"Schubert, the colonel of the Pavlograd Hussars, is dining with us today. He has been here on leave and is taking Nicholas back with him. It can't be helped!" said the count, shrugging his shoulders and speaking playfully of a matter that evidently distressed him.

"I have already told you, Papa," said his son, "that if you don't

wish to let me go, I'll stay. But I know I am no use anywhere except in the army; I am not a diplomat or a government clerk.--I don't know how to hide what I feel." As he spoke he kept glancing with the flirtatiousness of a handsome youth at Sonya and the young lady visitor.

The little kitten, feasting her eyes on him, seemed ready at any moment to start her gambols again and display her kittenish nature.

"All right, all right!" said the old count. "He always flares up! This Buonaparte has turned all their heads; they all think of how he rose from an ensign and became Emperor. Well, well, God grant it," he added, not noticing his visitor's sarcastic smile.

The elders began talking about Bonaparte. Julie Karagina turned to young Rostov.

"What a pity you weren't at the Arkharovs' on Thursday. It was so dull without you," said she, giving him a tender smile.

The young man, flattered, sat down nearer to her with a coquettish smile, and engaged the smiling Julie in a confidential conversation without at all noticing that his involuntary smile had stabbed the heart of Sonya, who blushed and smiled unnaturally. In the midst of his talk he glanced round at her. She gave him a passionately angry glance, and hardly able to restrain her tears and maintain the artificial smile on her lips, she got up and left the room. All Nicholas' animation vanished. He waited for the first pause in the conversation, and then with a distressed face left the room to find Sonya.

"How plainly all these young people wear their hearts on their sleeves!" said Anna Mikhaylovna, pointing to Nicholas as he went out. "Cousinage--dangereux voisinage;*" she added.

*Cousinhood is a dangerous neighborhood.

"Yes," said the countess when the brightness these young people had brought into the room had vanished; and as if answering a question no one had put but which was always in her mind, "and how much suffering, how much anxiety one has had to go through that we might rejoice in them now! And yet really the anxiety is greater now than the joy. One is always, always anxious! Especially just at this age, so dangerous both for girls and boys."

"It all depends on the bringing up," remarked the visitor.

"Yes, you're quite right," continued the countess. "Till now I have always, thank God, been my children's friend and had their full confidence," said she, repeating the mistake of so many parents who imagine that their children have no secrets from them. "I know I shall always be my daughters' first confidante, and that if Nicholas, with his impulsive nature, does get into mischief (a boy can't help it), he will all the same never be like those Petersburg young men."

"Yes, they are splendid, splendid youngsters," chimed in the count, who always solved questions that seemed to him perplexing by deciding that everything was splendid. "Just fancy: wants to be an hussar. What's one to do, my dear?"

"What a charming creature your younger girl is," said the visitor; "a little volcano!"

"Yes, a regular volcano," said the count. "Takes after me! And what a voice she has; though she's my daughter, I tell the truth when I say she'll be a singer, a second Salomoni! We have engaged an Italian to give her lessons."

"Isn't she too young? I have heard that it harms the voice to train it at that age."

"Oh no, not at all too young!" replied the count. "Why, our mothers used to be married at twelve or thirteen."

"And she's in love with Boris already. Just fancy!" said the countess with a gentle smile, looking at Boris' and went on, evidently concerned with a thought that always occupied her: "Now you see if I were to be severe with her and to forbid it... goodness knows what they might be up to on the sly" (she meant that they would be kissing), "but as it is, I know every word she utters. She will come running to me of her own accord in the evening and tell me everything. Perhaps I spoil her, but really that seems the best plan. With her elder sister I was stricter."

"Yes, I was brought up quite differently," remarked the handsome elder daughter, Countess Vera, with a smile.

But the smile did not enhance Vera's beauty as smiles generally do; on the contrary it gave her an unnatural, and therefore unpleasant, expression. Vera was good-looking, not at all stupid, quick at learning, was well brought up, and had a pleasant voice; what she said was true and appropriate, yet, strange to say, everyone--the visitors and countess alike--turned to look at her as if wondering why she had said it, and they all felt awkward.

"People are always too clever with their eldest children and try to make something exceptional of them," said the visitor.

"What's the good of denying it, my dear? Our dear countess was too clever with Vera," said the count. "Well, what of that? She's turned out splendidly all the same," he added, winking at Vera.

The guests got up and took their leave, promising to return to dinner.

"What manners! I thought they would never go," said the countess, when she had seen her guests out.

CHAPTER XIII

When Natasha ran out of the drawing room she only went as far as the conservatory. There she paused and stood listening to the conversation in the drawing room, waiting for Boris to come out. She was already growing impatient, and stamped her foot, ready to cry at his not coming at once, when she heard the young man's discreet steps approaching neither quickly nor slowly. At this Natasha dashed swiftly among the flower tubs and hid there.

Boris paused in the middle of the room, looked round, brushed a little dust from the sleeve of his uniform, and going up to a mirror examined his handsome face. Natasha, very still, peered out from her ambush, waiting to see what he would do. He stood a little while before the glass, smiled, and walked toward the other door. Natasha was about to call him but changed her mind. "Let him look for me," thought she. Hardly had Boris gone than Sonya, flushed, in tears, and muttering angrily, came in at the other door. Natasha checked her first impulse to run out to her, and remained in her hiding place, watching--as under an invisible cap--to see what went on in the world. She was experiencing a new and peculiar pleasure. Sonya, muttering to herself, kept looking round toward the drawing-room door. It opened and Nicholas came in.

"Sonya, what is the matter with you? How can you?" said he,

running up to her.

"It's nothing, nothing; leave me alone!" sobbed Sonya.

"Ah, I know what it is."

"Well, if you do, so much the better, and you can go back to her!"

"So-o-onya! Look here! How can you torture me and yourself like that, for a mere fancy?" said Nicholas taking her hand.

Sonya did not pull it away, and left off crying. Natasha, not stirring and scarcely breathing, watched from her ambush with sparkling eyes. "What will happen now?" thought she.

"Sonya! What is anyone in the world to me? You alone are everything!" said Nicholas. "And I will prove it to you."

"I don't like you to talk like that."

"Well, then, I won't; only forgive me, Sonya!" He drew her to him and kissed her.

"Oh, how nice," thought Natasha; and when Sonya and Nicholas had gone out of the conservatory she followed and called Boris to her.

"Boris, come here," said she with a sly and significant look. "I have something to tell you. Here, here!" and she led him into the conservatory to the place among the tubs where she had been hiding.

Boris followed her, smiling.

"What is the something?" asked he.

She grew confused, glanced round, and, seeing the doll she had thrown down on one of the tubs, picked it up.

"Kiss the doll," said she.

Boris looked attentively and kindly at her eager face, but did not reply.

"Don't you want to? Well, then, come here," said she, and went further in among the plants and threw down the doll. "Closer, closer!" she whispered.

She caught the young officer by his cuffs, and a look of solemnity and fear appeared on her flushed face.

"And me? Would you like to kiss me?" she whispered almost inaudibly, glancing up at him from under her brows, smiling, and almost crying from excitement.

Boris blushed.

"How funny you are!" he said, bending down to her and blushing still more, but he waited and did nothing.

Suddenly she jumped up onto a tub to be higher than he, embraced him so that both her slender bare arms clasped him above his neck, and, tossing back her hair, kissed him full on the lips.

Then she slipped down among the flowerpots on the other side of the tubs and stood, hanging her head.

"Natasha," he said, "you know that I love you, but..."

"You are in love with me?" Natasha broke in.

"Yes, I am, but please don't let us do like that.... In another four

years... then I will ask for your hand."

Natasha considered.

"Thirteen, fourteen, fifteen, sixteen," she counted on her slender little fingers. "All right! Then it's settled?"

A smile of joy and satisfaction lit up her eager face.

"Settled!" replied Boris.

"Forever?" said the little girl. "Till death itself?"

She took his arm and with a happy face went with him into the adjoining sitting room.

CHAPTER XIV

After receiving her visitors, the countess was so tired that she gave orders to admit no more, but the porter was told to be sure to invite to dinner all who came "to congratulate." The countess wished to have a tete-a-tete talk with the friend of her childhood, Princess Anna Mikhaylovna, whom she had not seen properly since she returned from Petersburg. Anna Mikhaylovna, with her tear-worn but pleasant face, drew her chair nearer to that of the countess.

"With you I will be quite frank," said Anna Mikhaylovna. "There are not many left of us old friends! That's why I so value your friendship."

Anna Mikhaylovna looked at Vera and paused. The countess pressed her friend's hand.

"Vera," she said to her eldest daughter who was evidently not a favorite, "how is it you have so little tact? Don't you see you are not wanted here? Go to the other girls, or..."

The handsome Vera smiled contemptuously but did not seem at all hurt.

"If you had told me sooner, Mamma, I would have gone," she replied as she rose to go to her own room.

But as she passed the sitting room she noticed two couples sitting, one pair at each window. She stopped and smiled scornfully. Sonya was sitting close to Nicholas who was copying out some verses for her, the first he had ever written. Boris and Natasha were at the other window and ceased talking when Vera entered. Sonya and Natasha looked at Vera with guilty, happy faces.

It was pleasant and touching to see these little girls in love; but apparently the sight of them roused no pleasant feeling in Vera.

"How often have I asked you not to take my things?" she said. "You have a room of your own," and she took the inkstand from Nicholas.

"In a minute, in a minute," he said, dipping his pen.

"You always manage to do things at the wrong time," continued Vera. "You came rushing into the drawing room so that everyone felt ashamed of you."

Though what she said was quite just, perhaps for that very reason no one replied, and the four simply looked at one another. She lingered in the room with the inkstand in her hand.

"And at your age what secrets can there be between Natasha and Boris, or between you two? It's all nonsense!"

"Now, Vera, what does it matter to you?" said Natasha in defense, speaking very gently.

She seemed that day to be more than ever kind and affectionate to everyone.

"Very silly," said Vera. "I am ashamed of you. Secrets indeed!"

"All have secrets of their own," answered Natasha, getting warmer. "We don't interfere with you and Berg."

"I should think not," said Vera, "because there can never be anything wrong in my behavior. But I'll just tell Mamma how you are behaving with Boris."

"Natalya Ilyinichna behaves very well to me," remarked Boris. "I have nothing to complain of."

"Don't, Boris! You are such a diplomat that it is really tiresome," said Natasha in a mortified voice that trembled slightly. (She used the word "diplomat," which was just then much in vogue among the children, in the special sense they attached to it.) "Why does she bother me?" And she added, turning to Vera, "You'll never understand it, because you've never loved anyone. You have no heart! You are a Madame de Genlis and nothing more" (this nickname, bestowed on Vera by Nicholas, was considered very stinging), "and your greatest pleasure is to be unpleasant to people! Go and flirt with Berg as much as you please," she finished quickly.

"I shall at any rate not run after a young man before visitors..."

"Well, now you've done what you wanted," put in Nicholas--"said unpleasant things to everyone and upset them. Let's go to the nursery."

All four, like a flock of scared birds, got up and left the room.

"The unpleasant things were said to me," remarked Vera, "I said none to anyone."

"Madame de Genlis! Madame de Genlis!" shouted laughing voices through the door.

The handsome Vera, who produced such an irritating and unpleasant effect on everyone, smiled and, evidently unmoved by what had been said to her, went to the looking glass and arranged her hair and scarf. Looking at her own handsome face she seemed to become still colder and calmer.

In the drawing room the conversation was still going on.

"Ah, my dear," said the countess, "my life is not all roses either. Don't I know that at the rate we are living our means won't last long? It's all the Club and his easygoing nature. Even in the country do we get any rest? Theatricals, hunting, and heaven knows what besides! But don't let's talk about me; tell me how you managed everything. I often wonder at you, Annette--how at your age you can rush off alone in a carriage to Moscow, to Petersburg, to those ministers and great people, and know how to deal with them all! It's quite astonishing. How did you get things settled? I couldn't possibly do it."

"Ah, my love," answered Anna Mikhaylovna, "God grant you never know what it is to be left a widow without means and with a son you love to distraction! One learns many things then," she added with a

certain pride. "That lawsuit taught me much. When I want to see one of those big people I write a note: 'Princess So-and-So desires an interview with So and-So,' and then I take a cab and go myself two, three, or four times--till I get what I want. I don't mind what they think of me."

"Well, and to whom did you apply about Bory?" asked the countess. "You see yours is already an officer in the Guards, while my Nicholas is going as a cadet. There's no one to interest himself for him. To whom did you apply?"

"To Prince Vasili. He was so kind. He at once agreed to everything, and put the matter before the Emperor," said Princess Anna Mikhaylovna enthusiastically, quite forgetting all the humiliation she had endured to gain her end.

"Has Prince Vasili aged much?" asked the countess. "I have not seen him since we acted together at the Rumyantsovs' theatricals. I expect he has forgotten me. He paid me attentions in those days," said the countess, with a smile.

"He is just the same as ever," replied Anna Mikhaylovna, "overflowing with amiability. His position has not turned his head at all. He said to me, 'I am sorry I can do so little for you, dear Princess. I am at your command.' Yes, he is a fine fellow and a very kind relation. But, Nataly, you know my love for my son: I would do anything for his happiness! And my affairs are in such a bad way that my position is now a terrible one," continued Anna Mikhaylovna, sadly, dropping her voice. "My wretched lawsuit takes all I have and makes no progress. Would you believe it, I have literally not a penny and don't know how to equip Boris." She took out her handkerchief and began to cry. "I need five hundred rubles, and have only one twenty-five-ruble note. I am in such a state.... My only hope now is in Count Cyril Vladimirovich Bezukhov. If he will not assist his godson--you know he is Bory's godfather--and allow him something for his maintenance, all my trouble will have been thrown away.... I shall not be able to equip him."

The countess' eyes filled with tears and she pondered in silence.

"I often think, though, perhaps it's a sin," said the princess, "that here lives Count Cyril Vladimirovich Bezukhov so rich, all alone... that tremendous fortune... and what is his life worth? It's a burden to him, and Bory's life is only just beginning...."

"Surely he will leave something to Boris," said the countess.

"Heaven only knows, my dear! These rich grandees are so selfish. Still, I will take Boris and go to see him at once, and I shall speak to him straight out. Let people think what they will of me, it's really all the same to me when my son's fate is at stake." The princess rose. "It's now two o'clock and you dine at four. There will just be time."

And like a practical Petersburg lady who knows how to make the most of time, Anna Mikhaylovna sent someone to call her son, and went into the anteroom with him.

"Good-by, my dear," said she to the countess who saw her to the door, and added in a whisper so that her son should not hear, "Wish me good luck."

"Are you going to Count Cyril Vladimirovich, my dear?" said the count coming out from the dining hall into the anteroom, and he added: "If he is better, ask Pierre to dine with us. He has been to the house, you know, and danced with the children. Be sure to invite him, my dear. We will see how Taras distinguishes himself today. He says Count Orlov never gave such a dinner as ours will be!"

CHAPTER XV

"My dear Boris," said Princess Anna Mikhaylovna to her son as Countess Rostova's carriage in which they were seated drove over the straw covered street and turned into the wide courtyard of Count Cyril Vladimirovich Bezukhov's house. "My dear Boris," said the mother, drawing her hand from beneath her old mantle and laying it timidly and tenderly on her son's arm, "be affectionate and attentive to him. Count Cyril Vladimirovich is your godfather after all, your future depends on him. Remember that, my dear, and be nice to him, as you so well know how to be."

"If only I knew that anything besides humiliation would come of it..." answered her son coldly. "But I have promised and will do it for your sake."

Although the hall porter saw someone's carriage standing at the entrance, after scrutinizing the mother and son (who without asking to be announced had passed straight through the glass porch between the rows of statues in niches) and looking significantly at the lady's old cloak, he asked whether they wanted the count or the princesses, and, hearing that they wished to see the count, said his excellency was worse today, and that his excellency was not receiving anyone.

"We may as well go back," said the son in French.

"My dear!" exclaimed his mother imploringly, again laying her hand on his arm as if that touch might soothe or rouse him.

Boris said no more, but looked inquiringly at his mother without taking off his cloak.

"My friend," said Anna Mikhaylovna in gentle tones, addressing the hall porter, "I know Count Cyril Vladimirovich is very ill... that's why I have come... I am a relation. I shall not disturb him, my friend... I only need see Prince Vasili Sergeevich: he is staying here, is he not? Please announce me."

The hall porter sullenly pulled a bell that rang upstairs, and turned away.

"Princess Drubetskaya to see Prince Vasili Sergeevich," he called to a footman dressed in knee breeches, shoes, and a swallow-tail coat, who ran downstairs and looked over from the halfway landing.

The mother smoothed the folds of her dyed silk dress before a large Venetian mirror in the wall, and in her trodden-down shoes briskly ascended the carpeted stairs.

"My dear," she said to her son, once more stimulating him by a touch, "you promised me!"

The son, lowering his eyes, followed her quietly.

They entered the large hall, from which one of the doors led to the apartments assigned to Prince Vasili.

Just as the mother and son, having reached the middle of the hall, were about to ask their way of an elderly footman who had sprung up as they entered, the bronze handle of one of the doors turned and Prince Vasili came out--wearing a velvet coat with a single star on his breast, as was his custom when at home--taking leave of a good-looking, dark-haired man. This was the celebrated Petersburg doctor, Lorrain.

"Then it is certain?" said the prince.

"Prince, humanum est errare,* but..." replied the doctor, swallowing his r's, and pronouncing the Latin words with a French accent.

*To err is human.

"Very well, very well..."

Seeing Anna Mikhaylovna and her son, Prince Vasili dismissed the doctor with a bow and approached them silently and with a look of inquiry. The son noticed that an expression of profound sorrow suddenly clouded his mother's face, and he smiled slightly.

"Ah, Prince! In what sad circumstances we meet again! And how is our dear invalid?" said she, as though unaware of the cold offensive look fixed on her.

Prince Vasili stared at her and at Boris questioningly and perplexed. Boris bowed politely. Prince Vasili without acknowledging the bow turned to Anna Mikhaylovna, answering her query by a movement of the head and lips indicating very little hope for the patient.

"Is it possible?" exclaimed Anna Mikhaylovna. "Oh, how awful! It is terrible to think.... This is my son," she added, indicating Boris. "He wanted to thank you himself."

Boris bowed again politely.

"Believe me, Prince, a mother's heart will never forget what you have done for us."

"I am glad I was able to do you a service, my dear Anna Mikhaylovna," said Prince Vasili, arranging his lace frill, and in tone and manner, here in Moscow to Anna Mikhaylovna whom he had placed under an obligation, assuming an air of much greater importance than he had done in Petersburg at Anna Scherer's reception.

"Try to serve well and show yourself worthy," added he, addressing Boris with severity. "I am glad.... Are you here on leave?" he went on in his usual tone of indifference.

"I am awaiting orders to join my new regiment, your excellency," replied Boris, betraying neither annoyance at the prince's brusque manner nor a desire to enter into conversation, but speaking so quietly and respectfully that the prince gave him a searching glance.

"Are you living with your mother?"

"I am living at Countess Rostova's," replied Boris, again adding, "your excellency."

"That is, with Ilya Rostov who married Nataly Shinshina," said Anna Mikhaylovna.

"I know, I know," answered Prince Vasili in his monotonous voice. "I never could understand how Nataly made up her mind to marry that unlicked bear! A perfectly absurd and stupid fellow, and a gambler too, I am told."

"But a very kind man, Prince," said Anna Mikhaylovna with a pathetic smile, as though she too knew that Count Rostov deserved this censure, but asked him not to be too hard on the poor old man. "What do the doctors say?" asked the princess after a pause, her worn face again expressing deep sorrow.

"They give little hope," replied the prince.

"And I should so like to thank Uncle once for all his kindness to me

and Boris. He is his godson," she added, her tone suggesting that this fact ought to give Prince Vasili much satisfaction.

Prince Vasili became thoughtful and frowned. Anna Mikhaylovna saw that he was afraid of finding in her a rival for Count Bezukhov's fortune, and hastened to reassure him.

"If it were not for my sincere affection and devotion to Uncle," said she, uttering the word with peculiar assurance and unconcern, "I know his character: noble, upright... but you see he has no one with him except the young princesses.... They are still young...." She bent her head and continued in a whisper: "Has he performed his final duty, Prince? How priceless are those last moments! It can make things no worse, and it is absolutely necessary to prepare him if he is so ill. We women, Prince," and she smiled tenderly, "always know how to say these things. I absolutely must see him, however painful it may be for me. I am used to suffering."

Evidently the prince understood her, and also understood, as he had done at Anna Pavlovna's, that it would be difficult to get rid of Anna Mikhaylovna.

"Would not such a meeting be too trying for him, dear Anna Mikhaylovna?" said he. "Let us wait until evening. The doctors are expecting a crisis."

"But one cannot delay, Prince, at such a moment! Consider that the welfare of his soul is at stake. Ah, it is awful: the duties of a Christian..."

A door of one of the inner rooms opened and one of the princesses, the count's niece, entered with a cold, stern face. The length of her body was strikingly out of proportion to her short legs. Prince Vasili turned to her.

"Well, how is he?"

"Still the same; but what can you expect, this noise..." said the princess, looking at Anna Mikhaylovna as at a stranger.

"Ah, my dear, I hardly knew you," said Anna Mikhaylovna with a happy smile, ambling lightly up to the count's niece. "I have come, and am at your service to help you nurse my uncle. I imagine what you have gone through," and she sympathetically turned up her eyes.

The princess gave no reply and did not even smile, but left the room as Anna Mikhaylovna took off her gloves and, occupying the position she had conquered, settled down in an armchair, inviting Prince Vasili to take a seat beside her.

"Boris," she said to her son with a smile, "I shall go in to see the count, my uncle; but you, my dear, had better go to Pierre meanwhile and don't forget to give him the Rostovs' invitation. They ask him to dinner. I suppose he won't go?" she continued, turning to the prince.

"On the contrary," replied the prince, who had plainly become depressed, "I shall be only too glad if you relieve me of that young man.... Here he is, and the count has not once asked for him."

He shrugged his shoulders. A footman conducted Boris down one flight of stairs and up another, to Pierre's rooms.

CHAPTER XVI

Pierre, after all, had not managed to choose a career for himself in Petersburg, and had been expelled from there for riotous conduct and sent to Moscow. The story told about him at Count Rostov's was true. Pierre had taken part in tying a policeman to a bear. He had now been for some days in Moscow and was staying as usual at his father's house. Though he expected that the story of his escapade would be already known in Moscow and that the ladies about his father-who were never favorably disposed toward him--would have used it to turn the count against him, he nevertheless on the day of his arrival went to his father's part of the house. Entering the drawing room, where the princesses spent most of their time, he greeted the ladies, two of whom were sitting at embroidery frames while a third read aloud. It was the eldest who was reading--the one who had met Anna Mikhaylovna. The two younger ones were embroidering: both were rosy and pretty and they differed only in that one had a little mole on her lip which made her much prettier. Pierre was received as if he were a corpse or a leper. The eldest princess paused in her reading and silently stared at him with frightened eyes; the second assumed precisely the same expression; while the youngest, the one with the mole, who was of a cheerful and lively disposition, bent over her frame to hide a smile probably evoked by the amusing scene she foresaw. She drew her wool down through the canvas and, scarcely able to refrain from laughing, stooped as if trying to make out the pattern.

"How do you do, cousin?" said Pierre. "You don't recognize me?"

"I recognize you only too well, too well."

"How is the count? Can I see him?" asked Pierre, awkwardly as usual, but unabashed.

"The count is suffering physically and mentally, and apparently you have done your best to increase his mental sufferings."

"Can I see the count?" Pierre again asked.

"Hm.... If you wish to kill him, to kill him outright, you can see him... Olga, go and see whether Uncle's beef tea is ready--it is almost time," she added, giving Pierre to understand that they were busy, and busy making his father comfortable, while evidently he, Pierre, was only busy causing him annoyance.

Olga went out. Pierre stood looking at the sisters; then he bowed and said: "Then I will go to my rooms. You will let me know when I can see him."

And he left the room, followed by the low but ringing laughter of the sister with the mole.

Next day Prince Vasili had arrived and settled in the count's house. He sent for Pierre and said to him: "My dear fellow, if you are going to behave here as you did in Petersburg, you will end very badly; that is all I have to say to you. The count is very, very ill, and you must not see him at all."

Since then Pierre had not been disturbed and had spent the whole time in his rooms upstairs.

When Boris appeared at his door Pierre was pacing up and down his room, stopping occasionally at a corner to make menacing gestures at the wall, as if running a sword through an invisible foe, and glaring savagely over his spectacles, and then again resuming his walk, muttering indistinct words, shrugging his shoulders and gesticulating.

"England is done for," said he, scowling and pointing his finger at someone unseen. "Mr. Pitt, as a traitor to the nation and to the rights of man, is sentenced to..." But before Pierre--who at that moment imagined himself to be Napoleon in person and to have just

effected the dangerous crossing of the Straits of Dover and captured London--could pronounce Pitt's sentence, he saw a well-built and handsome young officer entering his room. Pierre paused. He had left Moscow when Boris was a boy of fourteen, and had quite forgotten him, but in his usual impulsive and hearty way he took Boris by the hand with a friendly smile.

"Do you remember me?" asked Boris quietly with a pleasant smile.
"I have come with my mother to see the count, but it seems he is not well."

"Yes, it seems he is ill. People are always disturbing him,"
answered Pierre, trying to remember who this young man was.

Boris felt that Pierre did not recognize him but did not consider it necessary to introduce himself, and without experiencing the least embarrassment looked Pierre straight in the face.

"Count Rostov asks you to come to dinner today," said he, after a considerable pause which made Pierre feel uncomfortable.

"Ah, Count Rostov!" exclaimed Pierre joyfully. "Then you are his son, Ilya? Only fancy, I didn't know you at first. Do you remember how we went to the Sparrow Hills with Madame Jacquot?... It's such an age..."

"You are mistaken," said Boris deliberately, with a bold and slightly sarcastic smile. "I am Boris, son of Princess Anna Mikhaylovna Drubetskaya. Rostov, the father, is Ilya, and his son is Nicholas. I never knew any Madame Jacquot."

Pierre shook his head and arms as if attacked by mosquitoes or bees.

"Oh dear, what am I thinking about? I've mixed everything up. One has so many relatives in Moscow! So you are Boris? Of course. Well, now we know where we are. And what do you think of the Boulogne expedition? The English will come off badly, you know, if Napoleon gets across the Channel. I think the expedition is quite feasible. If only Villeneuve doesn't make a mess of things!"

Boris knew nothing about the Boulogne expedition; he did not read the papers and it was the first time he had heard Villeneuve's name.

"We here in Moscow are more occupied with dinner parties and scandal than with politics," said he in his quiet ironical tone. "I know nothing about it and have not thought about it. Moscow is chiefly busy with gossip," he continued. "Just now they are talking about you and your father."

Pierre smiled in his good-natured way as if afraid for his companion's sake that the latter might say something he would afterwards regret. But Boris spoke distinctly, clearly, and dryly, looking straight into Pierre's eyes.

"Moscow has nothing else to do but gossip," Boris went on.
"Everybody is wondering to whom the count will leave his fortune,
though he may perhaps outlive us all, as I sincerely hope he will..."

"Yes, it is all very horrid," interrupted Pierre, "very horrid."

Pierre was still afraid that this officer might inadvertently say something disconcerting to himself.

"And it must seem to you," said Boris flushing slightly, but not changing his tone or attitude, "it must seem to you that everyone is trying to get something out of the rich man?"

"So it does," thought Pierre.

"But I just wish to say, to avoid misunderstandings, that you are

quite mistaken if you reckon me or my mother among such people. We are very poor, but for my own part at any rate, for the very reason that your father is rich, I don't regard myself as a relation of his, and neither I nor my mother would ever ask or take anything from him."

For a long time Pierre could not understand, but when he did, he jumped up from the sofa, seized Boris under the elbow in his quick, clumsy way, and, blushing far more than Boris, began to speak with a feeling of mingled shame and vexation.

"Well, this is strange! Do you suppose I... who could think?... I know very well..."

But Boris again interrupted him.

"I am glad I have spoken out fully. Perhaps you did not like it? You must excuse me," said he, putting Pierre at ease instead of being put at ease by him, "but I hope I have not offended you. I always make it a rule to speak out... Well, what answer am I to take? Will you come to dinner at the Rostovs'?"

And Boris, having apparently relieved himself of an onerous duty and extricated himself from an awkward situation and placed another in it, became quite pleasant again.

"No, but I say," said Pierre, calming down, "you are a wonderful fellow! What you have just said is good, very good. Of course you don't know me. We have not met for such a long time... not since we were children. You might think that I... I understand, quite understand. I could not have done it myself, I should not have had the courage, but it's splendid. I am very glad to have made your acquaintance. It's queer," he added after a pause, "that you should have suspected me!" He began to laugh. "Well, what of it! I hope we'll get better acquainted," and he pressed Boris' hand. "Do you know, I have not once been in to see the count. He has not sent for me.... I am sorry for him as a man, but what can one do?"

"And so you think Napoleon will manage to get an army across?" asked Boris with a smile.

Pierre saw that Boris wished to change the subject, and being of the same mind he began explaining the advantages and disadvantages of the Boulogne expedition.

A footman came in to summon Boris--the princess was going. Pierre, in order to make Boris' better acquaintance, promised to come to dinner, and warmly pressing his hand looked affectionately over his spectacles into Boris' eyes. After he had gone Pierre continued pacing up and down the room for a long time, no longer piercing an imaginary foe with his imaginary sword, but smiling at the remembrance of that pleasant, intelligent, and resolute young man.

As often happens in early youth, especially to one who leads a lonely life, he felt an unaccountable tenderness for this young man and made up his mind that they would be friends.

Prince Vasili saw the princess off. She held a handkerchief to her eyes and her face was tearful.

"It is dreadful, dreadful!" she was saying, "but cost me what it may I shall do my duty. I will come and spend the night. He must not be left like this. Every moment is precious. I can't think why his nieces put it off. Perhaps God will help me to find a way to prepare him!... Adieu, Prince! May God support you..."

"Adieu, ma bonne," answered Prince Vasili turning away from her.

"Oh, he is in a dreadful state," said the mother to her son when they were in the carriage. "He hardly recognizes anybody."

"I don't understand, Mamma--what is his attitude to Pierre?" asked the son.

"The will will show that, my dear; our fate also depends on it."

"But why do you expect that he will leave us anything?"

"Ah, my dear! He is so rich, and we are so poor!"

"Well, that is hardly a sufficient reason, Mamma..."

"Oh, Heaven! How ill he is!" exclaimed the mother.

CHAPTER XVII

After Anna Mikhaylovna had driven off with her son to visit Count Cyril Vladimirovich Bezukhov, Countess Rostova sat for a long time all alone applying her handkerchief to her eyes. At last she rang.

"What is the matter with you, my dear?" she said crossly to the maid who kept her waiting some minutes. "Don't you wish to serve me? Then I'll find you another place."

The countess was upset by her friend's sorrow and humiliating poverty, and was therefore out of sorts, a state of mind which with her always found expression in calling her maid "my dear" and speaking to her with exaggerated politeness.

"I am very sorry, ma'am," answered the maid.

"Ask the count to come to me."

The count came waddling in to see his wife with a rather guilty look as usual.

"Well, little countess? What a saute of game au madere we are to have, my dear! I tasted it. The thousand rubles I paid for Taras were not ill-spent. He is worth it!"

He sat down by his wife, his elbows on his knees and his hands ruffling his gray hair.

"What are your commands, little countess?"

"You see, my dear... What's that mess?" she said, pointing to his waistcoat. "It's the saute, most likely," she added with a smile.

"Well, you see, Count, I want some money."

Her face became sad.

"Oh, little countess!"... and the count began bustling to get out his pocketbook.

"I want a great deal, Count! I want five hundred rubles," and taking out her cambric handkerchief she began wiping her husband's waistcoat.

"Yes, immediately, immediately! Hey, who's there?" he called out in a tone only used by persons who are certain that those they call will rush to obey the summons. "Send Dmitri to me!"

Dmitri, a man of good family who had been brought up in the count's house and now managed all his affairs, stepped softly into the room.

"This is what I want, my dear fellow," said the count to the deferential young man who had entered. "Bring me..." he reflected a

moment, "yes, bring me seven hundred rubles, yes! But mind, don't bring me such tattered and dirty notes as last time, but nice clean ones for the countess."

"Yes, Dmitri, clean ones, please," said the countess, sighing deeply.

"When would you like them, your excellency?" asked Dmitri. "Allow me to inform you... But, don't be uneasy," he added, noticing that the count was beginning to breathe heavily and quickly which was always a sign of approaching anger. "I was forgetting... Do you wish it brought at once?"

"Yes, yes; just so! Bring it. Give it to the countess."

"What a treasure that Dmitri is," added the count with a smile when the young man had departed. "There is never any 'impossible' with him. That's a thing I hate! Everything is possible."

"Ah, money, Count, money! How much sorrow it causes in the world," said the countess. "But I am in great need of this sum."

"You, my little countess, are a notorious spendthrift," said the count, and having kissed his wife's hand he went back to his study.

When Anna Mikhaylovna returned from Count Bezukhov's the money, all in clean notes, was lying ready under a handkerchief on the countess' little table, and Anna Mikhaylovna noticed that something was agitating her.

"Well, my dear?" asked the countess.

"Oh, what a terrible state he is in! One would not know him, he is so ill! I was only there a few moments and hardly said a word..."

"Annette, for heaven's sake don't refuse me," the countess began, with a blush that looked very strange on her thin, dignified, elderly face, and she took the money from under the handkerchief.

Anna Mikhaylovna instantly guessed her intention and stooped to be ready to embrace the countess at the appropriate moment.

"This is for Boris from me, for his outfit."

Anna Mikhaylovna was already embracing her and weeping. The countess wept too. They wept because they were friends, and because they were kindhearted, and because they--friends from childhood--had to think about such a base thing as money, and because their youth was over.... But those tears were pleasant to them both.

CHAPTER XVIII

Countess Rostova, with her daughters and a large number of guests, was already seated in the drawing room. The count took the gentlemen into his study and showed them his choice collection of Turkish pipes. From time to time he went out to ask: "Hasn't she come yet?" They were expecting Marya Dmitrievna Akhrosimova, known in society as le terrible dragon, a lady distinguished not for wealth or rank, but for common sense and frank plainness of speech. Marya Dmitrievna was known to the Imperial family as well as to all Moscow and Petersburg, and both cities wondered at her, laughed privately at her rudenesses, and told good stories about her, while none the less all without exception respected and feared her.

In the count's room, which was full of tobacco smoke, they talked of

war that had been announced in a manifesto, and about the recruiting. None of them had yet seen the manifesto, but they all knew it had appeared. The count sat on the sofa between two guests who were smoking and talking. He neither smoked nor talked, but bending his head first to one side and then to the other watched the smokers with evident pleasure and listened to the conversation of his two neighbors, whom he egged on against each other.

One of them was a sallow, clean-shaven civilian with a thin and wrinkled face, already growing old, though he was dressed like a most fashionable young man. He sat with his legs up on the sofa as if quite at home and, having stuck an amber mouthpiece far into his mouth, was inhaling the smoke spasmodically and screwing up his eyes. This was an old bachelor, Shinshin, a cousin of the countess', a man with "a sharp tongue" as they said in Moscow society. He seemed to be condescending to his companion. The latter, a fresh, rosy officer of the Guards, irreproachably washed, brushed, and buttoned, held his pipe in the middle of his mouth and with red lips gently inhaled the smoke, letting it escape from his handsome mouth in rings. This was Lieutenant Berg, an officer in the Semenov regiment with whom Boris was to travel to join the army, and about whom Natasha had, teased her elder sister Vera, speaking of Berg as her "intended." The count sat between them and listened attentively. His favorite occupation when not playing boston, a card game he was very fond of, was that of listener, especially when he succeeded in setting two loquacious talkers at one another.

"Well, then, old chap, mon tres honorable Alphonse Karlovich," said Shinshin, laughing ironically and mixing the most ordinary Russian expressions with the choicest French phrases--which was a peculiarity of his speech. "Vous comptez vous faire des rentes sur l'etat;* you want to make something out of your company?"

*You expect to make an income out of the government.

"No, Peter Nikolaevich; I only want to show that in the cavalry the advantages are far less than in the infantry. Just consider my own position now, Peter Nikolaevich..."

Berg always spoke quietly, politely, and with great precision. His conversation always related entirely to himself; he would remain calm and silent when the talk related to any topic that had no direct bearing on himself. He could remain silent for hours without being at all put out of countenance himself or making others uncomfortable, but as soon as the conversation concerned himself he would begin to talk circumstantially and with evident satisfaction.

"Consider my position, Peter Nikolaevich. Were I in the cavalry I should get not more than two hundred rubles every four months, even with the rank of lieutenant; but as it is I receive two hundred and thirty," said he, looking at Shinshin and the count with a joyful, pleasant smile, as if it were obvious to him that his success must always be the chief desire of everyone else.

"Besides that, Peter Nikolaevich, by exchanging into the Guards I shall be in a more prominent position," continued Berg, "and vacancies occur much more frequently in the Foot Guards. Then just think what can be done with two hundred and thirty rubles! I even manage to put a little aside and to send something to my father," he went on, emitting a smoke ring.

"La balance y est...* A German knows how to skin a flint, as the proverb says," remarked Shinshin, moving his pipe to the other side of his mouth and winking at the count.

*So that squares matters.

The count burst out laughing. The other guests seeing that Shinshin was talking came up to listen. Berg, oblivious of irony or indifference, continued to explain how by exchanging into the Guards he had already gained a step on his old comrades of the Cadet Corps; how in wartime the company commander might get killed and he, as senior in the company, might easily succeed to the post; how popular he was with everyone in the regiment, and how satisfied his father was with him. Berg evidently enjoyed narrating all this, and did not seem to suspect that others, too, might have their own interests. But all he said was so prettily sedate, and the naivete of his youthful egotism was so obvious, that he disarmed his hearers.

"Well, my boy, you'll get along wherever you go--foot or horse--that I'll warrant," said Shinshin, patting him on the shoulder and taking his feet off the sofa.

Berg smiled joyously. The count, by his guests, went into the drawing room.

It was just the moment before a big dinner when the assembled guests, expecting the summons to zakuska,* avoid engaging in any long conversation but think it necessary to move about and talk, in order to show that they are not at all impatient for their food. The host and hostess look toward the door, and now and then glance at one another, and the visitors try to guess from these glances who, or what, they are waiting for--some important relation who has not yet arrived, or a dish that is not yet ready.

*Hors d'oeuvres.

Pierre had come just at dinnertime and was sitting awkwardly in the middle of the drawing room on the first chair he had come across, blocking the way for everyone. The countess tried to make him talk, but he went on naively looking around through his spectacles as if in search of somebody and answered all her questions in monosyllables. He was in the way and was the only one who did not notice the fact. Most of the guests, knowing of the affair with the bear, looked with curiosity at this big, stout, quiet man, wondering how such a clumsy, modest fellow could have played such a prank on a policeman.

"You have only lately arrived?" the countess asked him.

"Oui, madame," replied he, looking around him.

"You have not yet seen my husband?"

"Non, madame." He smiled quite inappropriately.

"You have been in Paris recently, I believe? I suppose it's very interesting."

"Very interesting."

The countess exchanged glances with Anna Mikhaylovna. The latter understood that she was being asked to entertain this young man, and sitting down beside him she began to speak about his father; but he answered her, as he had the countess, only in monosyllables. The other guests were all conversing with one another. "The Razumovskis... It was charming... You are very kind... Countess Apraksina..." was heard on all sides. The countess rose and went into the ballroom.

"Marya Dmitrievna?" came her voice from there.

"Herself," came the answer in a rough voice, and Marya Dmitrievna entered the room.

All the unmarried ladies and even the married ones except the very oldest rose. Marya Dmitrievna paused at the door. Tall and stout, holding high her fifty-year-old head with its gray curls, she stood surveying the guests, and leisurely arranged her wide sleeves as if rolling them up. Marya Dmitrievna always spoke in Russian.

"Health and happiness to her whose name day we are keeping and to her children," she said, in her loud, full-toned voice which drowned all others. "Well, you old sinner," she went on, turning to the count who was kissing her hand, "you're feeling dull in Moscow, I daresay? Nowhere to hunt with your dogs? But what is to be done, old man? Just see how these nestlings are growing up," and she pointed to the girls. "You must look for husbands for them whether you like it or not...."

"Well," said she, "how's my Cossack?" (Marya Dmitrievna always called Natasha a Cossack) and she stroked the child's arm as she came up fearless and gay to kiss her hand. "I know she's a scamp of a girl, but I like her."

She took a pair of pear-shaped ruby earrings from her huge reticule and, having given them to the rosy Natasha, who beamed with the pleasure of her saint's-day fete, turned away at once and addressed herself to Pierre.

"Eh, eh, friend! Come here a bit," said she, assuming a soft high tone of voice. "Come here, my friend..." and she ominously tucked up her sleeves still higher. Pierre approached, looking at her in a childlike way through his spectacles.

"Come nearer, come nearer, friend! I used to be the only one to tell your father the truth when he was in favor, and in your case it's my evident duty." She paused. All were silent, expectant of what was to follow, for this was dearly only a prelude.

"A fine lad! My word! A fine lad!... His father lies on his deathbed and he amuses himself setting a policeman astride a bear! For shame, sir, for shame! It would be better if you went to the war."

She turned away and gave her hand to the count, who could hardly keep from laughing.

"Well, I suppose it is time we were at table?" said Marya Dmitrievna.

The count went in first with Marya Dmitrievna, the countess followed on the arm of a colonel of hussars, a man of importance to them because Nicholas was to go with him to the regiment; then came Anna Mikhaylovna with Shinshin. Berg gave his arm to Vera. The smiling Julie Karagina went in with Nicholas. After them other couples followed, filling the whole dining hall, and last of all the children, tutors, and governesses followed singly. The footmen began moving about, chairs scraped, the band struck up in the gallery, and the guests settled down in their places. Then the strains of the count's household band were replaced by the clatter of knives and forks, the voices of visitors, and the soft steps of the footmen. At one end of the table sat the countess with Marya Dmitrievna on her right and Anna Mikhaylovna on her left, the other lady visitors were farther down. At the other end sat the count, with the hussar colonel on his left and Shinshin and the other male visitors on his right. Midway down the long table on one side sat the grownup young people: Vera beside Berg, and Pierre beside Boris; and on the other side, the children, tutors, and governesses. From behind the crystal decanters and fruit vases the count kept glancing at his wife and her tall cap with its light-blue ribbons, and busily filled his neighbors' glasses, not neglecting his own. The countess in turn, without omitting her duties as hostess, threw significant glances from behind the pineapples at her husband whose face and bald head seemed by their redness to contrast more than usual with his gray hair. At the ladies' end an even chatter of voices was heard all the time, at the men's end

the voices sounded louder and louder, especially that of the colonel of hussars who, growing more and more flushed, ate and drank so much that the count held him up as a pattern to the other guests. Berg with tender smiles was saying to Vera that love is not an earthly but a heavenly feeling. Boris was telling his new friend Pierre who the guests were and exchanging glances with Natasha, who was sitting opposite. Pierre spoke little but examined the new faces, and ate a great deal. Of the two soups he chose turtle with savory patties and went on to the game without omitting a single dish or one of the wines. These latter the butler thrust mysteriously forward, wrapped in a napkin, from behind the next man's shoulders and whispered: "Dry Madeira"..."Hungarian"..."Rhine wine" as the case might be. Of the four crystal glasses engraved with the count's monogram that stood before his plate, Pierre held out one at random and drank with enjoyment, gazing with ever-increasing amiability at the other guests. Natasha, who sat opposite, was looking at Boris as girls of thirteen look at the boy they are in love with and have just kissed for the first time. Sometimes that same look fell on Pierre, and that funny lively little girl's look made him inclined to laugh without knowing why.

Nicholas sat at some distance from Sonya, beside Julie Karagina, to whom he was again talking with the same involuntary smile. Sonya wore a company smile but was evidently tormented by jealousy; now she turned pale, now blushed and strained every nerve to overhear what Nicholas and Julie were saying to one another. The governess kept looking round uneasily as if preparing to resent any slight that might be put upon the children. The German tutor was trying to remember all the dishes, wines, and kinds of dessert, in order to send a full description of the dinner to his people in Germany; and he felt greatly offended when the butler with a bottle wrapped in a napkin passed him by. He frowned, trying to appear as if he did not want any of that wine, but was mortified because no one would understand that it was not to quench his thirst or from greediness that he wanted it, but simply from a conscientious desire for knowledge.

CHAPTER XIX

At the men's end of the table the talk grew more and more animated. The colonel told them that the declaration of war had already appeared in Petersburg and that a copy, which he had himself seen, had that day been forwarded by courier to the commander in chief.

"And why the deuce are we going to fight Bonaparte?" remarked Shinshin. "He has stopped Austria's cackle and I fear it will be our turn next."

The colonel was a stout, tall, plethoric German, evidently devoted to the service and patriotically Russian. He resented Shinshin's remark.

"It is for the reasoon, my goot sir," said he, speaking with a German accent, "for the reasoon zat ze Emperor knows zat. He declares in ze manifessto zat he cannot fiew wiz indifference ze danger vreatening Russia and zat ze safety and dignity of ze Empire as vell as ze sanctity of its alliances..." he spoke this last word with particular emphasis as if in it lay the gist of the matter.

Then with the unerring official memory that characterized him he repeated from the opening words of the manifesto:

... and the wish, which constitutes the Emperor's sole and absolute aim--to establish peace in Europe on firm foundations--has now decided him to despatch part of the army abroad and to create a

new condition for the attainment of that purpose.

"Zat, my dear sir, is vy..." he concluded, drinking a tumbler of wine with dignity and looking to the count for approval.

"Connaissez-vous le Proverbe:* 'Jerome, Jerome, do not roam, but turn spindles at home!'" said Shinshin, puckering his brows and smiling. "Cela nous convient a merveille.*[2] Suvorov now--he knew what he was about; yet they beat him a plate couture,*[3] and where are we to find Suvorovs now? Je vous demande un peu,"*[4] said he, continually changing from French to Russian.

*Do you know the proverb?

*[2] That suits us down to the ground.

*[3] Hollow.

*[4] I just ask you that.

"Ve must vight to the last tr-r-op of our plood!" said the colonel, thumping the table; "and ve must tie for our Emperor, and zen all vill pe vell. And ve must discuss it as little as po-o-ossible"... he dwelt particularly on the word possible... "as po-o-ossible," he ended, again turning to the count. "Zat is how ve old hussars look at it, and zere's an end of it! And how do you, a young man and a young hussar, how do you judge of it?" he added, addressing Nicholas, who when he heard that the war was being discussed had turned from his partner with eyes and ears intent on the colonel.

"I am quite of your opinion," replied Nicholas, flaming up, turning his plate round and moving his wineglasses about with as much decision and desperation as though he were at that moment facing some great danger. "I am convinced that we Russians must die or conquer," he concluded, conscious--as were others--after the words were uttered that his remarks were too enthusiastic and emphatic for the occasion and were therefore awkward.

"What you said just now was splendid!" said his partner Julie.

Sonya trembled all over and blushed to her ears and behind them and down to her neck and shoulders while Nicholas was speaking.

Pierre listened to the colonel's speech and nodded approvingly.

"That's fine," said he.

"The young man's a real hussar!" shouted the colonel, again thumping the table.

"What are you making such a noise about over there?" Marya Dmitrievna's deep voice suddenly inquired from the other end of the table. "What are you thumping the table for?" she demanded of the hussar, "and why are you exciting yourself? Do you think the French are here?"

"I am speaking ze truce," replied the hussar with a smile.

"It's all about the war," the count shouted down the table. "You know my son's going, Marya Dmitrievna? My son is going."

"I have four sons in the army but still I don't fret. It is all in God's hands. You may die in your bed or God may spare you in a battle," replied Marya Dmitrievna's deep voice, which easily carried the whole length of the table.

"That's true!"

Once more the conversations concentrated, the ladies' at the one end and the men's at the other.

"You won't ask," Natasha's little brother was saying; "I know you won't ask!"

"I will," replied Natasha.

Her face suddenly flushed with reckless and joyous resolution. She half rose, by a glance inviting Pierre, who sat opposite, to listen to what was coming, and turning to her mother:

"Mamma!" rang out the clear contralto notes of her childish voice, audible the whole length of the table.

"What is it?" asked the countess, startled; but seeing by her daughter's face that it was only mischief, she shook a finger at her sternly with a threatening and forbidding movement of her head.

The conversation was hushed.

"Mamma! What sweets are we going to have?" and Natasha's voice sounded still more firm and resolute.

The countess tried to frown, but could not. Marya Dmitrievna shook her fat finger.

"Cossack!" she said threateningly.

Most of the guests, uncertain how to regard this sally, looked at the elders.

"You had better take care!" said the countess.

"Mamma! What sweets are we going to have?" Natasha again cried boldly, with saucy gaiety, confident that her prank would be taken in good part.

Sonya and fat little Petya doubled up with laughter.

"You see! I have asked," whispered Natasha to her little brother and to Pierre, glancing at him again.

"Ice pudding, but you won't get any," said Marya Dmitrievna.

Natasha saw there was nothing to be afraid of and so she braved even Marya Dmitrievna.

"Marya Dmitrievna! What kind of ice pudding? I don't like ice cream."

"Carrot ices."

"No! What kind, Marya Dmitrievna? What kind?" she almost screamed; "I want to know!"

Marya Dmitrievna and the countess burst out laughing, and all the guests joined in. Everyone laughed, not at Marya Dmitrievna's answer but at the incredible boldness and smartness of this little girl who had dared to treat Marya Dmitrievna in this fashion.

Natasha only desisted when she had been told that there would be pineapple ice. Before the ices, champagne was served round. The band again struck up, the count and countess kissed, and the guests, leaving their seats, went up to "congratulate" the countess, and reached across the table to clink glasses with the count, with the children, and with one another. Again the footmen rushed about, chairs scraped, and in the same order in which they had entered but with redder faces, the guests returned to the drawing room and to the count's study.

CHAPTER XX

The card tables were drawn out, sets made up for boston, and the count's visitors settled themselves, some in the two drawing rooms, some in the sitting room, some in the library.

The count, holding his cards fanwise, kept himself with difficulty from dropping into his usual after-dinner nap, and laughed at everything. The young people, at the countess' instigation, gathered round the clavichord and harp. Julie by general request played first. After she had played a little air with variations on the harp, she joined the other young ladies in begging Natasha and Nicholas, who were noted for their musical talent, to sing something. Natasha, who was treated as though she were grown up, was evidently very proud of this but at the same time felt shy.

"What shall we sing?" she said.

"The Brook," suggested Nicholas.

"Well, then, let's be quick. Boris, come here," said Natasha. "But where is Sonya?"

She looked round and seeing that her friend was not in the room ran to look for her.

Running into Sonya's room and not finding her there, Natasha ran to the nursery, but Sonya was not there either. Natasha concluded that she must be on the chest in the passage. The chest in the passage was the place of mourning for the younger female generation in the Rostov household. And there in fact was Sonya lying face downward on Nurse's dirty feather bed on the top of the chest, crumpling her gauzy pink dress under her, hiding her face with her slender fingers, and sobbing so convulsively that her bare little shoulders shook. Natasha's face, which had been so radiantly happy all that saint's day, suddenly changed: her eyes became fixed, and then a shiver passed down her broad neck and the corners of her mouth drooped.

"Sonya! What is it? What is the matter?... Oo... Oo... Oo...!" And Natasha's large mouth widened, making her look quite ugly, and she began to wail like a baby without knowing why, except that Sonya was crying. Sonya tried to lift her head to answer but could not, and hid her face still deeper in the bed. Natasha wept, sitting on the blue-striped feather bed and hugging her friend. With an effort Sonya sat up and began wiping her eyes and explaining.

"Nicholas is going away in a week's time, his... papers... have come... he told me himself... but still I should not cry," and she showed a paper she held in her hand--with the verses Nicholas had written, "still, I should not cry, but you can't... no one can understand... what a soul he has!"

And she began to cry again because he had such a noble soul.

"It's all very well for you... I am not envious... I love you and Boris also," she went on, gaining a little strength; "he is nice... there are no difficulties in your way.... But Nicholas is my cousin... one would have to... the Metropolitan himself... and even then it can't be done. And besides, if she tells Mamma" (Sonya looked upon the countess as her mother and called her so) "that I am spoiling Nicholas' career and am heartless and ungrateful, while truly... God is my witness," and she made the sign of the cross, "I love her so much, and all of you, only Vera... And what for? What have I done to her? I am so grateful to you that I would willingly sacrifice

everything, only I have nothing...."

Sonya could not continue, and again hid her face in her hands and in the feather bed. Natasha began consoling her, but her face showed that she understood all the gravity of her friend's trouble.

"Sonya," she suddenly exclaimed, as if she had guessed the true reason of her friend's sorrow, "I'm sure Vera has said something to you since dinner? Hasn't she?"

"Yes, these verses Nicholas wrote himself and I copied some others, and she found them on my table and said she'd show them to Mamma, and that I was ungrateful, and that Mamma would never allow him to marry me, but that he'll marry Julie. You see how he's been with her all day... Natasha, what have I done to deserve it?..."

And again she began to sob, more bitterly than before. Natasha lifted her up, hugged her, and, smiling through her tears, began comforting her.

"Sonya, don't believe her, darling! Don't believe her! Do you remember how we and Nicholas, all three of us, talked in the sitting room after supper? Why, we settled how everything was to be. I don't quite remember how, but don't you remember that it could all be arranged and how nice it all was? There's Uncle Shinshin's brother has married his first cousin. And we are only second cousins, you know. And Boris says it is quite possible. You know I have told him all about it. And he is so clever and so good!" said Natasha. "Don't you cry, Sonya, dear love, darling Sonya!" and she kissed her and laughed. "Vera's spiteful; never mind her! And all will come right and she won't say anything to Mamma. Nicholas will tell her himself, and he doesn't care at all for Julie."

Natasha kissed her on the hair.

Sonya sat up. The little kitten brightened, its eyes shone, and it seemed ready to lift its tail, jump down on its soft paws, and begin playing with the ball of worsted as a kitten should.

"Do you think so?... Really? Truly?" she said, quickly smoothing her frock and hair.

"Really, truly!" answered Natasha, pushing in a crisp lock that had strayed from under her friend's plaits.

Both laughed.

"Well, let's go and sing 'The Brook.' "

"Come along!"

"Do you know, that fat Pierre who sat opposite me is so funny!" said Natasha, stopping suddenly. "I feel so happy!"

And she set off at a run along the passage.

Sonya, shaking off some down which clung to her and tucking away the verses in the bosom of her dress close to her bony little chest, ran after Natasha down the passage into the sitting room with flushed face and light, joyous steps. At the visitors' request the young people sang the quartette, "The Brook," with which everyone was delighted. Then Nicholas sang a song he had just learned:

At nighttime in the moon's fair glow
How sweet, as fancies wander free,
To feel that in this world there's one
Who still is thinking but of thee!

That while her fingers touch the harp
Wafting sweet music music the lea,
It is for thee thus swells her heart,
Sighing its message out to thee...

A day or two, then bliss unspoilt,
But oh! till then I cannot live!...

He had not finished the last verse before the young people began to get ready to dance in the large hall, and the sound of the feet and the coughing of the musicians were heard from the gallery.

Pierre was sitting in the drawing-room where Shinshin had engaged him, as a man recently returned from abroad, in a political conversation in which several others joined but which bored Pierre. When the music began Natasha came in and walking straight up to Pierre said, laughing and blushing:

"Mamma told me to ask you to join the dancers."

"I am afraid of mixing the figures," Pierre replied; "but if you will be my teacher..." And lowering his big arm he offered it to the slender little girl.

While the couples were arranging themselves and the musicians tuning up, Pierre sat down with his little partner. Natasha was perfectly happy; she was dancing with a grown-up man, who had been abroad. She was sitting in a conspicuous place and talking to him like a grown-up lady. She had a fan in her hand that one of the ladies had given her to hold. Assuming quite the pose of a society woman (heaven knows when and where she had learned it) she talked with her partner, fanning herself and smiling over the fan.

"Dear, dear! Just look at her!" exclaimed the countess as she crossed the ballroom, pointing to Natasha.

Natasha blushed and laughed.

"Well, really, Mamma! Why should you? What is there to be surprised at?"

In the midst of the third ecossaise there was a clatter of chairs being pushed back in the sitting room where the count and Marya Dmitrievna had been playing cards with the majority of the more distinguished and older visitors. They now, stretching themselves after sitting so long, and replacing their purses and pocketbooks, entered the ballroom. First came Marya Dmitrievna and the count, both with merry countenances. The count, with playful ceremony somewhat in ballet style, offered his bent arm to Marya Dmitrievna. He drew himself up, a smile of debonair gallantry lit up his face and as soon as the last figure of the ecossaise was ended, he clapped his hands to the musicians and shouted up to their gallery, addressing the first violin:

"Semen! Do you know the Daniel Cooper?"

This was the count's favorite dance, which he had danced in his youth. (Strictly speaking, Daniel Cooper was one figure of the anglaise.)

"Look at Papa!" shouted Natasha to the whole company, and quite forgetting that she was dancing with a grown-up partner she bent her curly head to her knees and made the whole room ring with her laughter.

And indeed everybody in the room looked with a smile of pleasure at the jovial old gentleman, who standing beside his tall and stout

partner, Marya Dmitrievna, curved his arms, beat time, straightened his shoulders, turned out his toes, tapped gently with his foot, and, by a smile that broadened his round face more and more, prepared the onlookers for what was to follow. As soon as the provocatively gay strains of Daniel Cooper (somewhat resembling those of a merry peasant dance) began to sound, all the doorways of the ballroom were suddenly filled by the domestic serfs--the men on one side and the women on the other--who with beaming faces had come to see their master making merry.

"Just look at the master! A regular eagle he is!" loudly remarked the nurse, as she stood in one of the doorways.

The count danced well and knew it. But his partner could not and did not want to dance well. Her enormous figure stood erect, her powerful arms hanging down (she had handed her reticule to the countess), and only her stern but handsome face really joined in the dance. What was expressed by the whole of the count's plump figure, in Marya Dmitrievna found expression only in her more and more beaming face and quivering nose. But if the count, getting more and more into the swing of it, charmed the spectators by the unexpectedness of his adroit maneuvers and the agility with which he capered about on his light feet, Marya Dmitrievna produced no less impression by slight exertions--the least effort to move her shoulders or bend her arms when turning, or stamp her foot--which everyone appreciated in view of her size and habitual severity. The dance grew livelier and livelier. The other couples could not attract a moment's attention to their own evolutions and did not even try to do so. All were watching the count and Marya Dmitrievna. Natasha kept pulling everyone by sleeve or dress, urging them to "look at Papa!" though as it was they never took their eyes off the couple. In the intervals of the dance the count, breathing deeply, waved and shouted to the musicians to play faster. Faster, faster, and faster; lightly, more lightly, and yet more lightly whirled the count, flying round Marya Dmitrievna, now on his toes, now on his heels; until, turning his partner round to her seat, he executed the final pas, raising his soft foot backwards, bowing his perspiring head, smiling and making a wide sweep with his arm, amid a thunder of applause and laughter led by Natasha. Both partners stood still, breathing heavily and wiping their faces with their cambric handkerchiefs.

"That's how we used to dance in our time, ma chere," said the count.

"That was a Daniel Cooper!" exclaimed Marya Dmitrievna, tucking up her sleeves and puffing heavily.

CHAPTER XXI

While in the Rostovs' ballroom the sixth anglaise was being danced, to a tune in which the weary musicians blundered, and while tired footmen and cooks were getting the supper, Count Bezukhov had a sixth stroke. The doctors pronounced recovery impossible. After a mute confession, communion was administered to the dying man, preparations made for the sacrament of unction, and in his house there was the bustle and thrill of suspense usual at such moments. Outside the house, beyond the gates, a group of undertakers, who hid whenever a carriage drove up, waited in expectation of an important order for an expensive funeral. The Military Governor of Moscow, who had been assiduous in sending aides-de-camp to inquire after the count's health, came himself that evening to bid a last farewell to the celebrated grandee of Catherine's court, Count Bezukhov.

The magnificent reception room was crowded. Everyone stood up respectfully when the Military Governor, having stayed about half an hour alone with the dying man, passed out, slightly acknowledging

their bows and trying to escape as quickly as from the glances fixed on him by the doctors, clergy, and relatives of the family. Prince Vasili, who had grown thinner and paler during the last few days, escorted him to the door, repeating something to him several times in low tones.

When the Military Governor had gone, Prince Vasili sat down all alone on a chair in the ballroom, crossing one leg high over the other, leaning his elbow on his knee and covering his face with his hand. After sitting so for a while he rose, and, looking about him with frightened eyes, went with unusually hurried steps down the long corridor leading to the back of the house, to the room of the eldest princess.

Those who were in the dimly lit reception room spoke in nervous whispers, and, whenever anyone went into or came from the dying man's room, grew silent and gazed with eyes full of curiosity or expectancy at his door, which creaked slightly when opened.

"The limits of human life... are fixed and may not be o'erpassed," said an old priest to a lady who had taken a seat beside him and was listening naively to his words.

"I wonder, is it not too late to administer unction?" asked the lady, adding the priest's clerical title, as if she had no opinion of her own on the subject.

"Ah, madam, it is a great sacrament," replied the priest, passing his hand over the thin grizzled strands of hair combed back across his bald head.

"Who was that? The Military Governor himself?" was being asked at the other side of the room. "How young-looking he is!"

"Yes, and he is over sixty. I hear the count no longer recognizes anyone. They wished to administer the sacrament of unction."

"I knew someone who received that sacrament seven times."

The second princess had just come from the sickroom with her eyes red from weeping and sat down beside Dr. Lorrain, who was sitting in a graceful pose under a portrait of Catherine, leaning his elbow on a table.

"Beautiful," said the doctor in answer to a remark about the weather. "The weather is beautiful, Princess; and besides, in Moscow one feels as if one were in the country."

"Yes, indeed," replied the princess with a sigh. "So he may have something to drink?"

Lorrain considered.

"Has he taken his medicine?"

"Yes."

The doctor glanced at his watch.

"Take a glass of boiled water and put a pinch of cream of tartar," and he indicated with his delicate fingers what he meant by a pinch.

"Dere has neffer been a gase," a German doctor was saying to an aide-de-camp, "dat one liffs after de sird stroke."

"And what a well-preserved man he was!" remarked the aide-de-camp.
"And who will inherit his wealth?" he added in a whisper.

"It von't go begging," replied the German with a smile.

Everyone again looked toward the door, which creaked as the second princess went in with the drink she had prepared according to Lorrain's instructions. The German doctor went up to Lorrain.

"Do you think he can last till morning?" asked the German, addressing Lorrain in French which he pronounced badly.

Lorrain, pursing up his lips, waved a severely negative finger before his nose.

"Tonight, not later," said he in a low voice, and he moved away with a decorous smile of self-satisfaction at being able clearly to understand and state the patient's condition.

Meanwhile Prince Vasili had opened the door into the princess' room.

In this room it was almost dark; only two tiny lamps were burning before the icons and there was a pleasant scent of flowers and burnt pastilles. The room was crowded with small pieces of furniture, whatnots, cupboards, and little tables. The quilt of a high, white feather bed was just visible behind a screen. A small dog began to bark.

"Ah, is it you, cousin?"

She rose and smoothed her hair, which was as usual so extremely smooth that it seemed to be made of one piece with her head and covered with varnish.

"Has anything happened?" she asked. "I am so terrified."

"No, there is no change. I only came to have a talk about business, Catiche,"* muttered the prince, seating himself wearily on the chair she had just vacated. "You have made the place warm, I must say," he remarked. "Well, sit down: let's have a talk."

*Catherine.

"I thought perhaps something had happened," she said with her unchanging stonily severe expression; and, sitting down opposite the prince, she prepared to listen.

"I wished to get a nap, mon cousin, but I can't."

"Well, my dear?" said Prince Vasili, taking her hand and bending it downwards as was his habit.

It was plain that this "well?" referred to much that they both understood without naming.

The princess, who had a straight, rigid body, abnormally long for her legs, looked directly at Prince Vasili with no sign of emotion in her prominent gray eyes. Then she shook her head and glanced up at the icons with a sigh. This might have been taken as an expression of sorrow and devotion, or of weariness and hope of resting before long. Prince Vasili understood it as an expression of weariness.

"And I?" he said; "do you think it is easier for me? I am as worn out as a post horse, but still I must have a talk with you, Catiche, a very serious talk."

Prince Vasili said no more and his cheeks began to twitch nervously, now on one side, now on the other, giving his face an unpleasant expression which was never to be seen on it in a drawing room. His eyes too seemed strange; at one moment they looked impudently sly and at the next glanced round in alarm.

The princess, holding her little dog on her lap with her thin bony hands, looked attentively into Prince Vasili's eyes evidently resolved not to be the first to break silence, if she had to wait till morning.

"Well, you see, my dear princess and cousin, Catherine Semenovna," continued Prince Vasili, returning to his theme, apparently not without an inner struggle; "at such a moment as this one must think of everything. One must think of the future, of all of you... I love you all, like children of my own, as you know."

The princess continued to look at him without moving, and with the same dull expression.

"And then of course my family has also to be considered," Prince Vasili went on, testily pushing away a little table without looking at her. "You know, Catiche, that we--you three sisters, Mamontov, and my wife--are the count's only direct heirs. I know, I know how hard it is for you to talk or think of such matters. It is no easier for me; but, my dear, I am getting on for sixty and must be prepared for anything. Do you know I have sent for Pierre? The count," pointing to his portrait, "definitely demanded that he should be called."

Prince Vasili looked questioningly at the princess, but could not make out whether she was considering what he had just said or whether she was simply looking at him.

"There is one thing I constantly pray God to grant, mon cousin," she replied, "and it is that He would be merciful to him and would allow his noble soul peacefully to leave this..."

"Yes, yes, of course," interrupted Prince Vasili impatiently, rubbing his bald head and angrily pulling back toward him the little table that he had pushed away. "But... in short, the fact is... you know yourself that last winter the count made a will by which he left all his property, not to us his direct heirs, but to Pierre."

"He has made wills enough!" quietly remarked the princess. "But he cannot leave the estate to Pierre. Pierre is illegitimate."

"But, my dear," said Prince Vasili suddenly, clutching the little table and becoming more animated and talking more rapidly: "what if a letter has been written to the Emperor in which the count asks for Pierre's legitimization? Do you understand that in consideration of the count's services, his request would be granted?..."

The princess smiled as people do who think they know more about the subject under discussion than those they are talking with.

"I can tell you more," continued Prince Vasili, seizing her hand, "that letter was written, though it was not sent, and the Emperor knew of it. The only question is, has it been destroyed or not? If not, then as soon as all is over," and Prince Vasili sighed to intimate what he meant by the words all is over, "and the count's papers are opened, the will and letter will be delivered to the Emperor, and the petition will certainly be granted. Pierre will get everything as the legitimate son."

"And our share?" asked the princess smiling ironically, as if anything might happen, only not that.

"But, my poor Catiche, it is as clear as daylight! He will then be the legal heir to everything and you won't get anything. You must know, my dear, whether the will and letter were written, and whether they have been destroyed or not. And if they have somehow been overlooked, you ought to know where they are, and must find them, because..."

"What next?" the princess interrupted, smiling sardonically and not changing the expression of her eyes. "I am a woman, and you

think we are all stupid; but I know this: an illegitimate son cannot inherit... un bastard!"* she added, as if supposing that this translation of the word would effectively prove to Prince Vasili the invalidity of his contention.

*A bastard.

"Well, really, Catiche! Can't you understand! You are so intelligent, how is it you don't see that if the count has written a letter to the Emperor begging him to recognize Pierre as legitimate, it follows that Pierre will not be Pierre but will become Count Bezukhov, and will then inherit everything under the will? And if the will and letter are not destroyed, then you will have nothing but the consolation of having been dutiful et tout ce qui s'ensuit!* That's certain."

*And all that follows therefrom.

"I know the will was made, but I also know that it is invalid; and you, mon cousin, seem to consider me a perfect fool," said the princess with the expression women assume when they suppose they are saying something witty and stinging.

"My dear Princess Catherine Semenovna," began Prince Vasili impatiently, "I came here not to wrangle with you, but to talk about your interests as with a kinswoman, a good, kind, true relation. And I tell you for the tenth time that if the letter to the Emperor and the will in Pierre's favor are among the count's papers, then, my dear girl, you and your sisters are not heiresses! If you don't believe me, then believe an expert. I have just been talking to Dmitri Onufrich" (the family solicitor) "and he says the same."

At this a sudden change evidently took place in the princess' ideas; her thin lips grew white, though her eyes did not change, and her voice when she began to speak passed through such transitions as she herself evidently did not expect.

"That would be a fine thing!" said she. "I never wanted anything and I don't now."

She pushed the little dog off her lap and smoothed her dress.

"And this is gratitude--this is recognition for those who have sacrificed everything for his sake!" she cried. "It's splendid! Fine! I don't want anything, Prince."

"Yes, but you are not the only one. There are your sisters..." replied Prince Vasili.

But the princess did not listen to him.

"Yes, I knew it long ago but had forgotten. I knew that I could expect nothing but meanness, deceit, envy, intrigue, and ingratitude--the blackest ingratitude--in this house..."

"Do you or do you not know where that will is?" insisted Prince Vasili, his cheeks twitching more than ever.

"Yes, I was a fool! I still believed in people, loved them, and sacrificed myself. But only the base, the vile succeed! I know who has been intriguing!"

The princess wished to rise, but the prince held her by the hand. She had the air of one who has suddenly lost faith in the whole human race. She gave her companion an angry glance.

"There is still time, my dear. You must remember, Catiche, that it was all done casually in a moment of anger, of illness, and was afterwards forgotten. Our duty, my dear, is to rectify his mistake, to ease his last moments by not letting him commit this injustice, and not to let him die feeling that he is rendering unhappy those who..."

"Who sacrificed everything for him," chimed in the princess, who would again have risen had not the prince still held her fast, "though he never could appreciate it. No, mon cousin," she added with a sigh, "I shall always remember that in this world one must expect no reward, that in this world there is neither honor nor justice. In this world one has to be cunning and cruel."

"Now come, come! Be reasonable. I know your excellent heart."

"No, I have a wicked heart."

"I know your heart," repeated the prince. "I value your friendship and wish you to have as good an opinion of me. Don't upset yourself, and let us talk sensibly while there is still time, be it a day or be it but an hour.... Tell me all you know about the will, and above all where it is. You must know. We will take it at once and show it to the count. He has, no doubt, forgotten it and will wish to destroy it. You understand that my sole desire is conscientiously to carry out his wishes; that is my only reason for being here. I came simply to help him and you."

"Now I see it all! I know who has been intriguing--I know!" cried the princess.

"That's not the point, my dear."

"It's that protege of yours, that sweet Princess Drubetskaya, that Anna Mikhaylovna whom I would not take for a housemaid... the infamous, vile woman!"

"Do not let us lose any time..."

"Ah, don't talk to me! Last winter she wheedled herself in here and told the count such vile, disgraceful things about us, especially about Sophie--I can't repeat them--that it made the count quite ill and he would not see us for a whole fortnight. I know it was then he wrote this vile, infamous paper, but I thought the thing was invalid."

"We've got to it at last--why did you not tell me about it sooner?"

"It's in the inlaid portfolio that he keeps under his pillow," said the princess, ignoring his question. "Now I know! Yes; if I have a sin, a great sin, it is hatred of that vile woman!" almost shrieked the princess, now quite changed. "And what does she come worming herself in here for? But I will give her a piece of my mind. The time will come!"

CHAPTER XXII

While these conversations were going on in the reception room and the princess' room, a carriage containing Pierre (who had been sent for) and Anna Mikhaylovna (who found it necessary to accompany him) was driving into the court of Count Bezukhov's house. As the wheels rolled softly over the straw beneath the windows, Anna Mikhaylovna, having turned with words of comfort to her companion, realized that he was asleep in his corner and woke him up. Rousing himself, Pierre followed Anna Mikhaylovna out of the carriage, and only then began to think of the interview with his dying father which awaited him.

He noticed that they had not come to the front entrance but to the back door. While he was getting down from the carriage steps two men, who looked like tradespeople, ran hurriedly from the entrance and hid in the shadow of the wall. Pausing for a moment, Pierre noticed several other men of the same kind hiding in the shadow of the house on both sides. But neither Anna Mikhaylovna nor the footman nor the coachman, who could not help seeing these people, took any notice of them. "It seems to be all right," Pierre concluded, and followed Anna Mikhaylovna. She hurriedly ascended the narrow dimly lit stone staircase, calling to Pierre, who was lagging behind, to follow. Though he did not see why it was necessary for him to go to the count at all, still less why he had to go by the back stairs, yet judging by Anna Mikhaylovna's air of assurance and haste, Pierre concluded that it was all absolutely necessary. Halfway up the stairs they were almost knocked over by some men who, carrying pails, came running downstairs, their boots clattering. These men pressed close to the wall to let Pierre and Anna Mikhaylovna pass and did not evince the least surprise at seeing them there.

"Is this the way to the princesses' apartments?" asked Anna Mikhaylovna of one of them.

"Yes," replied a footman in a bold loud voice, as if anything were now permissible; "the door to the left, ma'am."

"Perhaps the count did not ask for me," said Pierre when he reached the landing. "I'd better go to my own room."

Anna Mikhaylovna paused and waited for him to come up.

"Ah, my friend!" she said, touching his arm as she had done her son's when speaking to him that afternoon, "believe me I suffer no less than you do, but be a man!"

"But really, hadn't I better go away?" he asked, looking kindly at her over his spectacles.

"Ah, my dear friend! Forget the wrongs that may have been done you. Think that he is your father... perhaps in the agony of death." She sighed. "I have loved you like a son from the first. Trust yourself to me, Pierre. I shall not forget your interests."

Pierre did not understand a word, but the conviction that all this had to be grew stronger, and he meekly followed Anna Mikhaylovna who was already opening a door.

This door led into a back anteroom. An old man, a servant of the princesses, sat in a corner knitting a stocking. Pierre had never been in this part of the house and did not even know of the existence of these rooms. Anna Mikhaylovna, addressing a maid who was hurrying past with a decanter on a tray as "my dear" and "my sweet," asked about the princess' health and then led Pierre along a stone passage. The first door on the left led into the princesses' apartments. The maid with the decanter in her haste had not closed the door (everything in the house was done in haste at that time), and Pierre and Anna Mikhaylovna in passing instinctively glanced into the room, where Prince Vasili and the eldest princess were sitting close together talking. Seeing them pass, Prince Vasili drew back with obvious impatience, while the princess jumped up and with a gesture of desperation slammed the door with all her might.

This action was so unlike her usual composure and the fear depicted on Prince Vasili's face so out of keeping with his dignity that Pierre stopped and glanced inquiringly over his spectacles at his guide. Anna Mikhaylovna evinced no surprise, she only smiled faintly and sighed, as if to say that this was no more than she had expected.

"Be a man, my friend. I will look after your interests," said she in reply to his look, and went still faster along the passage.

Pierre could not make out what it was all about, and still less what "watching over his interests" meant, but he decided that all these things had to be. From the passage they went into a large, dimly lit room adjoining the count's reception room. It was one of those sumptuous but cold apartments known to Pierre only from the front approach, but even in this room there now stood an empty bath, and water had been spilled on the carpet. They were met by a deacon with a censer and by a servant who passed out on tiptoe without heeding them. They went into the reception room familiar to Pierre, with two Italian windows opening into the conservatory, with its large bust and full length portrait of Catherine the Great. The same people were still sitting here in almost the same positions as before, whispering to one another. All became silent and turned to look at the pale tear-worn Anna Mikhaylovna as she entered, and at the big stout figure of Pierre who, hanging his head, meekly followed her.

Anna Mikhaylovna's face expressed a consciousness that the decisive moment had arrived. With the air of a practical Petersburg lady she now, keeping Pierre close beside her, entered the room even more boldly than that afternoon. She felt that as she brought with her the person the dying man wished to see, her own admission was assured. Casting a rapid glance at all those in the room and noticing the count's confessor there, she glided up to him with a sort of amble, not exactly bowing yet seeming to grow suddenly smaller, and respectfully received the blessing first of one and then of another priest.

"God be thanked that you are in time," said she to one of the priests; "all we relatives have been in such anxiety. This young man is the count's son," she added more softly. "What a terrible moment!"

Having said this she went up to the doctor.

"Dear doctor," said she, "this young man is the count's son. Is there any hope?"

The doctor cast a rapid glance upwards and silently shrugged his shoulders. Anna Mikhaylovna with just the same movement raised her shoulders and eyes, almost closing the latter, sighed, and moved away from the doctor to Pierre. To him, in a particularly respectful and tenderly sad voice, she said:

"Trust in His mercy!" and pointing out a small sofa for him to sit and wait for her, she went silently toward the door that everyone was watching and it creaked very slightly as she disappeared behind it.

Pierre, having made up his mind to obey his mistress implicitly, moved toward the sofa she had indicated. As soon as Anna Mikhaylovna had disappeared he noticed that the eyes of all in the room turned to him with something more than curiosity and sympathy. He noticed that they whispered to one another, casting significant looks at him with a kind of awe and even servility. A deference such as he had never before received was shown him. A strange lady, the one who had been talking to the priests, rose and offered him her seat; an aide-de-camp picked up and returned a glove Pierre had dropped; the doctors became respectfully silent as he passed by, and moved to make way for him. At first Pierre wished to take another seat so as not to trouble the lady, and also to pick up the glove himself and to pass round the doctors who were not even in his way; but all at once he felt that this would not do, and that tonight he was a person obliged to perform some sort of awful rite which everyone expected of him, and that he was therefore bound to accept their services. He took the glove in silence from the aide-de-camp, and sat down in the lady's chair, placing his huge hands symmetrically on his knees in the naive attitude of an Egyptian statue, and decided in his own mind that all was as it should be, and that in order not to lose his head and do foolish things he must not act on his own ideas tonight, but must yield himself up entirely to the will of those who were guiding him.

Not two minutes had passed before Prince Vasili with head erect majestically entered the room. He was wearing his long coat with three stars on his breast. He seemed to have grown thinner since the morning; his eyes seemed larger than usual when he glanced round and noticed Pierre. He went up to him, took his hand (a thing he never used to do), and drew it downwards as if wishing to ascertain whether it was firmly fixed on.

"Courage, courage, my friend! He has asked to see you. That is well!" and he turned to go.

But Pierre thought it necessary to ask: "How is..." and hesitated, not knowing whether it would be proper to call the dying man "the count," yet ashamed to call him "father."

"He had another stroke about half an hour ago. Courage, my friend..."

Pierre's mind was in such a confused state that the word "stroke" suggested to him a blow from something. He looked at Prince Vasili in perplexity, and only later grasped that a stroke was an attack of illness. Prince Vasili said something to Lorrain in passing and went through the door on tiptoe. He could not walk well on tiptoe and his whole body jerked at each step. The eldest princess followed him, and the priests and deacons and some servants also went in at the door. Through that door was heard a noise of things being moved about, and at last Anna Mikhaylovna, still with the same expression, pale but resolute in the discharge of duty, ran out and touching Pierre lightly on the arm said:

"The divine mercy is inexhaustible! Unction is about to be administered. Come."

Pierre went in at the door, stepping on the soft carpet, and noticed that the strange lady, the aide-de-camp, and some of the servants, all followed him in, as if there were now no further need for permission to enter that room.

CHAPTER XXIII

Pierre well knew this large room divided by columns and an arch, its walls hung round with Persian carpets. The part of the room behind the columns, with a high silk-curtained mahogany bedstead on one side and on the other an immense case containing icons, was brightly illuminated with red light like a Russian church during evening service. Under the gleaming icons stood a long invalid chair, and in that chair on snowy-white smooth pillows, evidently freshly changed, Pierre saw--covered to the waist by a bright green quilt--the familiar, majestic figure of his father, Count Bezukhov, with that gray mane of hair above his broad forehead which reminded one of a lion, and the deep characteristically noble wrinkles of his handsome, ruddy face. He lay just under the icons; his large thick hands outside the quilt. Into the right hand, which was lying palm downwards, a wax taper had been thrust between forefinger and thumb, and an old servant, bending over from behind the chair, held it in position. By the chair stood the priests, their long hair falling over their magnificent glittering vestments, with lighted tapers in their hands, slowly and solemnly conducting the service. A little behind them stood the two younger princesses holding handkerchiefs to their eyes, and just in front of them their eldest sister, Catiche, with a vicious and determined look steadily fixed on the icons, as though declaring to all that she could not answer for herself should she glance round. Anna Mikhaylovna, with a meek, sorrowful, and all-forgiving expression on her face, stood by the door near the

strange lady. Prince Vasili in front of the door, near the invalid chair, a wax taper in his left hand, was leaning his left arm on the carved back of a velvet chair he had turned round for the purpose, and was crossing himself with his right hand, turning his eyes upward each time he touched his forehead. His face wore a calm look of piety and resignation to the will of God. "If you do not understand these sentiments," he seemed to be saying, "so much the worse for you!"

Behind him stood the aide-de-camp, the doctors, and the menservants; the men and women had separated as in church. All were silently crossing themselves, and the reading of the church service, the subdued chanting of deep bass voices, and in the intervals sighs and the shuffling of feet were the only sounds that could be heard. Anna Mikhaylovna, with an air of importance that showed that she felt she quite knew what she was about, went across the room to where Pierre was standing and gave him a taper. He lit it and, distracted by observing those around him, began crossing himself with the hand that held the taper.

Sophie, the rosy, laughter-loving, youngest princess with the mole, watched him. She smiled, hid her face in her handkerchief, and remained with it hidden for awhile; then looking up and seeing Pierre she again began to laugh. She evidently felt unable to look at him without laughing, but could not resist looking at him: so to be out of temptation she slipped quietly behind one of the columns. In the midst of the service the voices of the priests suddenly ceased, they whispered to one another, and the old servant who was holding the count's hand got up and said something to the ladies. Anna Mikhaylovna stepped forward and, stooping over the dying man, beckoned to Lorrain from behind her back. The French doctor held no taper; he was leaning against one of the columns in a respectful attitude implying that he, a foreigner, in spite of all differences of faith, understood the full importance of the rite now being performed and even approved of it. He now approached the sick man with the noiseless step of one in full vigor of life, with his delicate white fingers raised from the green quilt the hand that was free, and turning sideways felt the pulse and reflected a moment. The sick man was given something to drink, there was a stir around him, then the people resumed their places and the service continued. During this interval Pierre noticed that Prince Vasili left the chair on which he had been leaning, and--with air which intimated that he knew what he was about and if others did not understand him it was so much the worse for them--did not go up to the dying man, but passed by him, joined the eldest princess, and moved with her to the side of the room where stood the high bedstead with its silken hangings. On leaving the bed both Prince Vasili and the princess passed out by a back door, but returned to their places one after the other before the service was concluded. Pierre paid no more attention to this occurrence than to the rest of what went on, having made up his mind once for all that what he saw happening around him that evening was in some way essential.

The chanting of the service ceased, and the voice of the priest was heard respectfully congratulating the dying man on having received the sacrament. The dying man lay as lifeless and immovable as before. Around him everyone began to stir: steps were audible and whispers, among which Anna Mikhaylovna's was the most distinct.

Pierre heard her say:

"Certainly he must be moved onto the bed; here it will be impossible..."

The sick man was so surrounded by doctors, princesses, and servants that Pierre could no longer see the reddish-yellow face with its gray mane--which, though he saw other faces as well, he had not lost sight of for a single moment during the whole service. He judged by the cautious movements of those who crowded round the invalid chair that they had lifted the dying man and were moving him.

"Catch hold of my arm or you'll drop him!" he heard one of the servants say in a frightened whisper. "Catch hold from underneath. Here!" exclaimed different voices; and the heavy breathing of the bearers and the shuffling of their feet grew more hurried, as if the weight they were carrying were too much for them.

As the bearers, among whom was Anna Mikhaylovna, passed the young man he caught a momentary glimpse between their heads and backs of the dying man's high, stout, uncovered chest and powerful shoulders, raised by those who were holding him under the armpits, and of his gray, curly, leonine head. This head, with its remarkably broad brow and cheekbones, its handsome, sensual mouth, and its cold, majestic expression, was not disfigured by the approach of death. It was the same as Pierre remembered it three months before, when the count had sent him to Petersburg. But now this head was swaying helplessly with the uneven movements of the bearers, and the cold listless gaze fixed itself upon nothing.

After a few minutes' bustle beside the high bedstead, those who had carried the sick man dispersed. Anna Mikhaylovna touched Pierre's hand and said, "Come." Pierre went with her to the bed on which the sick man had been laid in a stately pose in keeping with the ceremony just completed. He lay with his head propped high on the pillows. His hands were symmetrically placed on the green silk quilt, the palms downward. When Pierre came up the count was gazing straight at him, but with a look the significance of which could not be understood by mortal man. Either this look meant nothing but that as long as one has eyes they must look somewhere, or it meant too much. Pierre hesitated, not knowing what to do, and glanced inquiringly at his guide. Anna Mikhaylovna made a hurried sign with her eyes, glancing at the sick man's hand and moving her lips as if to send it a kiss. Pierre, carefully stretching his neck so as not to touch the quilt, followed her suggestion and pressed his lips to the large boned, fleshy hand. Neither the hand nor a single muscle of the count's face stirred. Once more Pierre looked questioningly at Anna Mikhaylovna to see what he was to do next. Anna Mikhaylovna with her eyes indicated a chair that stood beside the bed. Pierre obediently sat down, his eyes asking if he were doing right. Anna Mikhaylovna nodded approvingly. Again Pierre fell into the naively symmetrical pose of an Egyptian statue, evidently distressed that his stout and clumsy body took up so much room and doing his utmost to look as small as possible. He looked at the count, who still gazed at the spot where Pierre's face had been before he sat down. Anna Mikhaylovna indicated by her attitude her consciousness of the pathetic importance of these last moments of meeting between the father and son. This lasted about two minutes, which to Pierre seemed an hour. Suddenly the broad muscles and lines of the count's face began to twitch. The twitching increased, the handsome mouth was drawn to one side (only now did Pierre realize how near death his father was), and from that distorted mouth issued an indistinct, hoarse sound. Anna Mikhaylovna looked attentively at the sick man's eyes, trying to guess what he wanted; she pointed first to Pierre, then to some drink, then named Prince Vasili in an inquiring whisper, then pointed to the quilt. The eyes and face of the sick man showed impatience. He made an effort to look at the servant who stood constantly at the head of the bed.

"Wants to turn on the other side," whispered the servant, and got up to turn the count's heavy body toward the wall.

Pierre rose to help him.

While the count was being turned over, one of his arms fell back helplessly and he made a fruitless effort to pull it forward. Whether he noticed the look of terror with which Pierre regarded that lifeless arm, or whether some other thought flitted across his dying brain, at any rate he glanced at the refractory arm, at Pierre's terror-stricken face, and again at the arm, and on his face a feeble, piteous smile appeared, quite out of keeping with his features, that seemed to deride his own helplessness. At sight of this

smile Pierre felt an unexpected quivering in his breast and a tickling in his nose, and tears dimmed his eyes. The sick man was turned on to his side with his face to the wall. He sighed.

"He is dozing," said Anna Mikhaylovna, observing that one of the princesses was coming to take her turn at watching. "Let us go."

Pierre went out.

CHAPTER XXIV

There was now no one in the reception room except Prince Vasili and the eldest princess, who were sitting under the portrait of Catherine the Great and talking eagerly. As soon as they saw Pierre and his companion they became silent, and Pierre thought he saw the princess hide something as she whispered:

"I can't bear the sight of that woman."

"Catiche has had tea served in the small drawing room," said Prince Vasili to Anna Mikhaylovna. "Go and take something, my poor Anna Mikhaylovna, or you will not hold out."

To Pierre he said nothing, merely giving his arm a sympathetic squeeze below the shoulder. Pierre went with Anna Mikhaylovna into the small drawing room.

"There is nothing so refreshing after a sleepless night as a cup of this delicious Russian tea," Lorrain was saying with an air of restrained animation as he stood sipping tea from a delicate Chinese handleless cup before a table on which tea and a cold supper were laid in the small circular room. Around the table all who were at Count Bezukhov's house that night had gathered to fortify themselves. Pierre well remembered this small circular drawing room with its mirrors and little tables. During balls given at the house Pierre, who did not know how to dance, had liked sitting in this room to watch the ladies who, as they passed through in their ball dresses with diamonds and pearls on their bare shoulders, looked at themselves in the brilliantly lighted mirrors which repeated their reflections several times. Now this same room was dimly lighted by two candles. On one small table tea things and supper dishes stood in disorder, and in the middle of the night a motley throng of people sat there, not merrymaking, but somberly whispering, and betraying by every word and movement that they none of them forgot what was happening and what was about to happen in the bedroom. Pierre did not eat anything though he would very much have liked to. He looked inquiringly at his mistress and saw that she was again going on tiptoe to the reception room where they had left Prince Vasili and the eldest princess. Pierre concluded that this also was essential, and after a short interval followed her. Anna Mikhaylovna was standing beside the princess, and they were both speaking in excited whispers.

"Permit me, Princess, to know what is necessary and what is not necessary," said the younger of the two speakers, evidently in the same state of excitement as when she had slammed the door of her room.

"But, my dear princess," answered Anna Mikhaylovna blandly but impressively, blocking the way to the bedroom and preventing the other from passing, "won't this be too much for poor Uncle at a moment when he needs repose? Worldly conversation at a moment when his soul is already prepared..."

Prince Vasili was seated in an easy chair in his familiar attitude, with one leg crossed high above the other. His cheeks, which were so flabby that they looked heavier below, were twitching

violently; but he wore the air of a man little concerned in what the two ladies were saying.

"Come, my dear Anna Mikhaylovna, let Catiche do as she pleases. You know how fond the count is of her."

"I don't even know what is in this paper," said the younger of the two ladies, addressing Prince Vasili and pointing to an inlaid portfolio she held in her hand. "All I know is that his real will is in his writing table, and this is a paper he has forgotten...."

She tried to pass Anna Mikhaylovna, but the latter sprang so as to bar her path.

"I know, my dear, kind princess," said Anna Mikhaylovna, seizing the portfolio so firmly that it was plain she would not let go easily. "Dear princess, I beg and implore you, have some pity on him! Je vous en conjure..."

The princess did not reply. Their efforts in the struggle for the portfolio were the only sounds audible, but it was evident that if the princess did speak, her words would not be flattering to Anna Mikhaylovna. Though the latter held on tenaciously, her voice lost none of its honeyed firmness and softness.

"Pierre, my dear, come here. I think he will not be out of place in a family consultation; is it not so, Prince?"

"Why don't you speak, cousin?" suddenly shrieked the princess so loud that those in the drawing room heard her and were startled. "Why do you remain silent when heaven knows who permits herself to interfere, making a scene on the very threshold of a dying man's room? Intriguere!" she hissed viciously, and tugged with all her might at the portfolio.

But Anna Mikhaylovna went forward a step or two to keep her hold on the portfolio, and changed her grip.

Prince Vasili rose. "Oh!" said he with reproach and surprise, "this is absurd! Come, let go I tell you."

The princess let go.

"And you too!"

But Anna Mikhaylovna did not obey him.

"Let go, I tell you! I will take the responsibility. I myself will go and ask him, I!... does that satisfy you?"

"But, Prince," said Anna Mikhaylovna, "after such a solemn sacrament, allow him a moment's peace! Here, Pierre, tell them your opinion," said she, turning to the young man who, having come quite close, was gazing with astonishment at the angry face of the princess which had lost all dignity, and at the twitching cheeks of Prince Vasili.

"Remember that you will answer for the consequences," said Prince Vasili severely. "You don't know what you are doing."

"Vile woman!" shouted the princess, darting unexpectedly at Anna Mikhaylovna and snatching the portfolio from her.

Prince Vasili bent his head and spread out his hands.

At this moment that terrible door, which Pierre had watched so long and which had always opened so quietly, burst noisily open and banged against the wall, and the second of the three sisters rushed out wringing her hands.

"What are you doing!" she cried vehemently. "He is dying and you leave me alone with him!"

Her sister dropped the portfolio. Anna Mikhaylovna, stooping, quickly caught up the object of contention and ran into the bedroom. The eldest princess and Prince Vasili, recovering themselves, followed her. A few minutes later the eldest sister came out with a pale hard face, again biting her underlip. At sight of Pierre her expression showed an irrepressible hatred.

"Yes, now you may be glad!" said she; "this is what you have been waiting for." And bursting into tears she hid her face in her handkerchief and rushed from the room.

Prince Vasili came next. He staggered to the sofa on which Pierre was sitting and dropped onto it, covering his face with his hand. Pierre noticed that he was pale and that his jaw quivered and shook as if in an ague.

"Ah, my friend!" said he, taking Pierre by the elbow; and there was in his voice a sincerity and weakness Pierre had never observed in it before. "How often we sin, how much we deceive, and all for what? I am near sixty, dear friend... I too... All will end in death, all! Death is awful..." and he burst into tears.

Anna Mikhaylovna came out last. She approached Pierre with slow, quiet steps.

"Pierre!" she said.

Pierre gave her an inquiring look. She kissed the young man on his forehead, wetting him with her tears. Then after a pause she said:

"He is no more...."

Pierre looked at her over his spectacles.

"Come, I will go with you. Try to weep, nothing gives such relief as tears."

She led him into the dark drawing room and Pierre was glad no one could see his face. Anna Mikhaylovna left him, and when she returned he was fast asleep with his head on his arm.

In the morning Anna Mikhaylovna said to Pierre:

"Yes, my dear, this is a great loss for us all, not to speak of you. But God will support you: you are young, and are now, I hope, in command of an immense fortune. The will has not yet been opened. I know you well enough to be sure that this will not turn your head, but it imposes duties on you, and you must be a man."

Pierre was silent.

"Perhaps later on I may tell you, my dear boy, that if I had not been there, God only knows what would have happened! You know, Uncle promised me only the day before yesterday not to forget Boris. But he had no time. I hope, my dear friend, you will carry out your father's wish?"

Pierre understood nothing of all this and coloring shyly looked in silence at Princess Anna Mikhaylovna. After her talk with Pierre, Anna Mikhaylovna returned to the Rostovs' and went to bed. On waking in the morning she told the Rostovs and all her acquaintances the details of Count Bezukhov's death. She said the count had died as she would herself wish to die, that his end was not only touching but edifying. As to the last meeting between father and son, it was so touching that she could not think of it without tears, and did not know which had behaved better during those awful moments--the father who so remembered everything and everybody at last and had

spoken such pathetic words to the son, or Pierre, whom it had been pitiful to see, so stricken was he with grief, though he tried hard to hide it in order not to sadden his dying father. "It is painful, but it does one good. It uplifts the soul to see such men as the old count and his worthy son," said she. Of the behavior of the eldest princess and Prince Vasili she spoke disapprovingly, but in whispers and as a great secret.

CHAPTER XXV

At Bald Hills, Prince Nicholas Andreevich Bolkonski's estate, the arrival of young Prince Andrew and his wife was daily expected, but this expectation did not upset the regular routine of life in the old prince's household. General in Chief Prince Nicholas Andreevich (nicknamed in society, "the King of Prussia") ever since the Emperor Paul had exiled him to his country estate had lived there continuously with his daughter, Princess Mary, and her companion, Mademoiselle Bourienne. Though in the new reign he was free to return to the capitals, he still continued to live in the country, remarking that anyone who wanted to see him could come the hundred miles from Moscow to Bald Hills, while he himself needed no one and nothing. He used to say that there are only two sources of human vice--idleness and superstition, and only two virtues--activity and intelligence. He himself undertook his daughter's education, and to develop these two cardinal virtues in her gave her lessons in algebra and geometry till she was twenty, and arranged her life so that her whole time was occupied. He was himself always occupied: writing his memoirs, solving problems in higher mathematics, turning snuffboxes on a lathe, working in the garden, or superintending the building that was always going on at his estate. As regularity is a prime condition facilitating activity, regularity in his household was carried to the highest point of exactitude. He always came to table under precisely the same conditions, and not only at the same hour but at the same minute. With those about him, from his daughter to his serfs, the prince was sharp and invariably exacting, so that without being a hardhearted man he inspired such fear and respect as few hardhearted men would have aroused. Although he was in retirement and had now no influence in political affairs, every high official appointed to the province in which the prince's estate lay considered it his duty to visit him and waited in the lofty antechamber ante chamber just as the architect, gardener, or Princess Mary did, till the prince appeared punctually to the appointed hour. Everyone sitting in this antechamber experienced the same feeling of respect and even fear when the enormously high study door opened and showed the figure of a rather small old man, with powdered wig, small withered hands, and bushy gray eyebrows which, when he frowned, sometimes hid the gleam of his shrewd, youthfully glittering eyes.

On the morning of the day that the young couple were to arrive, Princess Mary entered the antechamber as usual at the time appointed for the morning greeting, crossing herself with trepidation and repeating a silent prayer. Every morning she came in like that, and every morning prayed that the daily interview might pass off well.

An old powdered manservant who was sitting in the antechamber rose quietly and said in a whisper: "Please walk in."

Through the door came the regular hum of a lathe. The princess timidly opened the door which moved noiselessly and easily. She paused at the entrance. The prince was working at the lathe and after glancing round continued his work.

The enormous study was full of things evidently in constant use. The large table covered with books and plans, the tall glass-fronted bookcases with keys in the locks, the high desk for writing while

standing up, on which lay an open exercise book, and the lathe with tools laid ready to hand and shavings scattered around--all indicated continuous, varied, and orderly activity. The motion of the small foot shod in a Tartar boot embroidered with silver, and the firm pressure of the lean sinewy hand, showed that the prince still possessed the tenacious endurance and vigor of hardy old age. After a few more turns of the lathe he removed his foot from the pedal, wiped his chisel, dropped it into a leather pouch attached to the lathe, and, approaching the table, summoned his daughter. He never gave his children a blessing, so he simply held out his bristly cheek (as yet unshaven) and, regarding her tenderly and attentively, said severely:

"Quite well? All right then, sit down." He took the exercise book containing lessons in geometry written by himself and drew up a chair with his foot.

"For tomorrow!" said he, quickly finding the page and making a scratch from one paragraph to another with his hard nail.

The princess bent over the exercise book on the table.

"Wait a bit, here's a letter for you," said the old man suddenly, taking a letter addressed in a woman's hand from a bag hanging above the table, onto which he threw it.

At the sight of the letter red patches showed themselves on the princess' face. She took it quickly and bent her head over it.

"From Heloise?" asked the prince with a cold smile that showed his still sound, yellowish teeth.

"Yes, it's from Julie," replied the princess with a timid glance and a timid smile.

"I'll let two more letters pass, but the third I'll read," said the prince sternly; "I'm afraid you write much nonsense. I'll read the third!"

"Read this if you like, Father," said the princess, blushing still more and holding out the letter.

"The third, I said the third!" cried the prince abruptly, pushing the letter away, and leaning his elbows on the table he drew toward him the exercise book containing geometrical figures.

"Well, madam," he began, stooping over the book close to his daughter and placing an arm on the back of the chair on which she sat, so that she felt herself surrounded on all sides by the acrid scent of old age and tobacco, which she had known so long. "Now, madam, these triangles are equal; please note that the angle ABC..."

The princess looked in a scared way at her father's eyes glittering close to her; the red patches on her face came and went, and it was plain that she understood nothing and was so frightened that her fear would prevent her understanding any of her father's further explanations, however clear they might be. Whether it was the teacher's fault or the pupil's, this same thing happened every day: the princess' eyes grew dim, she could not see and could not hear anything, but was only conscious of her stern father's withered face close to her, of his breath and the smell of him, and could think only of how to get away quickly to her own room to make out the problem in peace. The old man was beside himself: moved the chair on which he was sitting noisily backward and forward, made efforts to control himself and not become vehement, but almost always did become vehement, scolded, and sometimes flung the exercise book away.

The princess gave a wrong answer.

"Well now, isn't she a fool!" shouted the prince, pushing the book

aside and turning sharply away; but rising immediately, he paced up and down, lightly touched his daughter's hair and sat down again.

He drew up his chair, and continued to explain.

"This won't do, Princess; it won't do," said he, when Princess Mary, having taken and closed the exercise book with the next day's lesson, was about to leave: "Mathematics are most important, madam! I don't want to have you like our silly ladies. Get used to it and you'll like it," and he patted her cheek. "It will drive all the nonsense out of your head."

She turned to go, but he stopped her with a gesture and took an uncut book from the high desk.

"Here is some sort of Key to the Mysteries that your Heloise has sent you. Religious! I don't interfere with anyone's belief... I have looked at it. Take it. Well, now go. Go."

He patted her on the shoulder and himself closed the door after her.

Princess Mary went back to her room with the sad, scared expression that rarely left her and which made her plain, sickly face yet plainer. She sat down at her writing table, on which stood miniature portraits and which was littered with books and papers. The princess was as untidy as her father was tidy. She put down the geometry book and eagerly broke the seal of her letter. It was from her most intimate friend from childhood; that same Julie Karagina who had been at the Rostovs' name-day party.

Julie wrote in French:

Dear and precious Friend, How terrible and frightful a thing is separation! Though I tell myself that half my life and half my happiness are wrapped up in you, and that in spite of the distance separating us our hearts are united by indissoluble bonds, my heart rebels against fate and in spite of the pleasures and distractions around me I cannot overcome a certain secret sorrow that has been in my heart ever since we parted. Why are we not together as we were last summer, in your big study, on the blue sofa, the confidential sofa? Why cannot I now, as three months ago, draw fresh moral strength from your look, so gentle, calm, and penetrating, a look I loved so well and seem to see before me as I write?

Having read thus far, Princess Mary sighed and glanced into the mirror which stood on her right. It reflected a weak, ungraceful figure and thin face. Her eyes, always sad, now looked with particular hopelessness at her reflection in the glass. "She flatters me," thought the princess, turning away and continuing to read. But Julie did not flatter her friend, the princess' eyes--large, deep and luminous (it seemed as if at times there radiated from them shafts of warm light)--were so beautiful that very often in spite of the plainness of her face they gave her an attraction more powerful than that of beauty. But the princess never saw the beautiful expression of her own eyes--the look they had when she was not thinking of herself. As with everyone, her face assumed a forced unnatural expression as soon as she looked in a glass. She went on reading:

All Moscow talks of nothing but war. One of my two brothers is already abroad, the other is with the Guards, who are starting on their march to the frontier. Our dear Emperor has left Petersburg and it is thought intends to expose his precious person to the chances of war. God grant that the Corsican monster who is destroying the peace of Europe may be overthrown by the angel whom it has pleased the Almighty, in His goodness, to give us as sovereign! To say nothing of my brothers, this war has deprived me of one of the associations nearest my heart. I mean young Nicholas Rostov, who with his

enthusiasm could not bear to remain inactive and has left the university to join the army. I will confess to you, dear Mary, that in spite of his extreme youth his departure for the army was a great grief to me. This young man, of whom I spoke to you last summer, is so noble-minded and full of that real youthfulness which one seldom finds nowadays among our old men of twenty and, particularly, he is so frank and has so much heart. He is so pure and poetic that my relations with him, transient as they were, have been one of the sweetest comforts to my poor heart, which has already suffered so much. Someday I will tell you about our parting and all that was said then. That is still too fresh. Ah, dear friend, you are happy not to know these poignant joys and sorrows. You are fortunate, for the latter are generally the stronger! I know very well that Count Nicholas is too young ever to be more to me than a friend, but this sweet friendship, this poetic and pure intimacy, were what my heart needed. But enough of this! The chief news, about which all Moscow gossips, is the death of old Count Bezukhov, and his inheritance. Fancy! The three princesses have received very little, Prince Vasili nothing, and it is Monsieur Pierre who has inherited all the property and has besides been recognized as legitimate; so that he is now Count Bezukhov and possessor of the finest fortune in Russia. It is rumored that Prince Vasili played a very despicable part in this affair and that he returned to Petersburg quite crestfallen.

I confess I understand very little about all these matters of wills and inheritance; but I do know that since this young man, whom we all used to know as plain Monsieur Pierre, has become Count Bezukhov and the owner of one of the largest fortunes in Russia, I am much amused to watch the change in the tone and manners of the mammas burdened by marriageable daughters, and of the young ladies themselves, toward him, though, between you and me, he always seemed to me a poor sort of fellow. As for the past two years people have amused themselves by finding husbands for me (most of whom I don't even know), the matchmaking chronicles of Moscow now speak of me as the future Countess Bezukhova. But you will understand that I have no desire for the post. A propos of marriages: do you know that a while ago that universal auntie Anna Mikhaylovna told me, under the seal of strict secrecy, of a plan of marriage for you. It is neither more nor less than with Prince Vasili's son Anatole, whom they wish to reform by marrying him to someone rich and distinguee, and it is on you that his relations' choice has fallen. I don't know what you will think of it, but I consider it my duty to let you know of it. He is said to be very handsome and a terrible scapegrace. That is all I have been able to find out about him.

But enough of gossip. I am at the end of my second sheet of paper, and Mamma has sent for me to go and dine at the Apraksins'. Read the mystical book I am sending you; it has an enormous success here. Though there are things in it difficult for the feeble human mind to grasp, it is an admirable book which calms and elevates the soul. Adieu! Give my respects to monsieur your father and my compliments to Mademoiselle Bourienne. I embrace you as I love you.

JULIE

P.S. Let me have news of your brother and his charming little wife.

The princess pondered awhile with a thoughtful smile and her luminous eyes lit up so that her face was entirely transformed. Then she suddenly rose and with her heavy tread went up to the table. She took a sheet of paper and her hand moved rapidly over it. This is the reply she wrote, also in French:

Dear and precious Friend, Your letter of the 13th has given me great delight. So you still love me, my romantic Julie? Separation, of which you say so much that is bad, does not seem to have had its usual effect on you. You complain of our separation. What then should I say, if I dared complain, I who am deprived of all who are dear to me?

Ah, if we had not religion to console us life would be very sad. Why do you suppose that I should look severely on your affection for that young man? On such matters I am only severe with myself. I understand such feelings in others, and if never having felt them I cannot approve of them, neither do I condemn them. Only it seems to me that Christian love, love of one's neighbor, love of one's enemy, is worthier, sweeter, and better than the feelings which the beautiful eyes of a young man can inspire in a romantic and loving young girl like yourself.

The news of Count Bezukhov's death reached us before your letter and my father was much affected by it. He says the count was the last representative but one of the great century, and that it is his own turn now, but that he will do all he can to let his turn come as late as possible. God preserve us from that terrible misfortune!

I cannot agree with you about Pierre, whom I knew as a child. He always seemed to me to have an excellent heart, and that is the quality I value most in people. As to his inheritance and the part played by Prince Vasili, it is very sad for both. Ah, my dear friend, our divine Saviour's words, that it is easier for a camel to go through the eye of a needle than for a rich man to enter the Kingdom of God, are terribly true. I pity Prince Vasili but am still more sorry for Pierre. So young, and burdened with such riches--to what temptations he will be exposed! If I were asked what I desire most on earth, it would be to be poorer than the poorest beggar. A thousand thanks, dear friend, for the volume you have sent me and which has such success in Moscow. Yet since you tell me that among some good things it contains others which our weak human understanding cannot grasp, it seems to me rather useless to spend time in reading what is unintelligible and can therefore bear no fruit. I never could understand the fondness some people have for confusing their minds by dwelling on mystical books that merely awaken their doubts and excite their imagination, giving them a bent for exaggeration quite contrary to Christian simplicity. Let us rather read the Epistles and Gospels. Let us not seek to penetrate what mysteries they contain; for how can we, miserable sinners that we are, know the terrible and holy secrets of Providence while we remain in this flesh which forms an impenetrable veil between us and the Eternal? Let us rather confine ourselves to studying those sublime rules which our divine Saviour has left for our guidance here below. Let us try to conform to them and follow them, and let us be persuaded that the less we let our feeble human minds roam, the better we shall please God, who rejects all knowledge that does not come from Him; and the less we seek to fathom what He has been pleased to conceal from us, the sooner will He vouchsafe its revelation to us through His divine Spirit.

My father has not spoken to me of a suitor, but has only told me that he has received a letter and is expecting a visit from Prince Vasili. In regard to this project of marriage for me, I will tell you, dear sweet friend, that I look on marriage as a divine institution to which we must conform. However painful it may be to me, should the Almighty lay the duties of wife and mother upon me I shall try to perform them as faithfully as I can, without disquieting myself by examining my feelings toward him whom He may give me for husband.

I have had a letter from my brother, who announces his speedy arrival at Bald Hills with his wife. This pleasure will be but a brief one, however, for he will leave, us again to take part in this unhappy war into which we have been drawn, God knows how or why. Not only where you are--at the heart of affairs and of the world--is the talk all of war, even here amid fieldwork and the calm of nature--which townsfolk consider characteristic of the country--rumors of war are heard and painfully felt. My father talks of nothing but marches and countermarches, things of which I understand nothing; and the day before yesterday during my daily walk through the village I witnessed a heartrending scene.... It was a convoy of conscripts enrolled from our people and starting to join the army. You should have seen the state of the mothers, wives, and children of the men who

were going and should have heard the sobs. It seems as though mankind has forgotten the laws of its divine Saviour, Who preached love and forgiveness of injuries--and that men attribute the greatest merit to skill in killing one another.

Adieu, dear and kind friend; may our divine Saviour and His most Holy Mother keep you in their holy and all-powerful care!

MARY

"Ah, you are sending off a letter, Princess? I have already dispatched mine. I have written to my poor mother," said the smiling Mademoiselle Bourienne rapidly, in her pleasant mellow tones and with guttural r's. She brought into Princess Mary's strenuous, mournful, and gloomy world a quite different atmosphere, careless, lighthearted, and self-satisfied.

"Princess, I must warn you," she added, lowering her voice and evidently listening to herself with pleasure, and speaking with exaggerated grasseyeement, "the prince has been scolding Michael Ivanovich. He is in a very bad humor, very morose. Be prepared."

"Ah, dear friend," replied Princess Mary, "I have asked you never to warn me of the humor my father is in. I do not allow myself to judge him and would not have others do so."

The princess glanced at her watch and, seeing that she was five minutes late in starting her practice on the clavichord, went into the sitting room with a look of alarm. Between twelve and two o'clock, as the day was mapped out, the prince rested and the princess played the clavichord.

CHAPTER XXVI

The gray-haired valet was sitting drowsily listening to the snoring of the prince, who was in his large study. From the far side of the house through the closed doors came the sound of difficult passages--twenty times repeated--of a sonata by Dussek.

Just then a closed carriage and another with a hood drove up to the porch. Prince Andrew got out of the carriage, helped his little wife to alight, and let her pass into the house before him. Old Tikhon, wearing a wig, put his head out of the door of the antechamber, reported in a whisper that the prince was sleeping, and hastily closed the door. Tikhon knew that neither the son's arrival nor any other unusual event must be allowed to disturb the appointed order of the day. Prince Andrew apparently knew this as well as Tikhon; he looked at his watch as if to ascertain whether his father's habits had changed since he was at home last, and, having assured himself that they had not, he turned to his wife.

"He will get up in twenty minutes. Let us go across to Mary's room," he said.

The little princess had grown stouter during this time, but her eyes and her short, downy, smiling lip lifted when she began to speak just as merrily and prettily as ever.

"Why, this is a palace!" she said to her husband, looking around with the expression with which people compliment their host at a ball. "Let's come, quick, quick!" And with a glance round, she smiled at Tikhon, at her husband, and at the footman who accompanied them.

"Is that Mary practicing? Let's go quietly and take her by

surprise."

Prince Andrew followed her with a courteous but sad expression.

"You've grown older, Tikhon," he said in passing to the old man, who kissed his hand.

Before they reached the room from which the sounds of the clavichord came, the pretty, fair haired Frenchwoman, Mademoiselle Bourienne, rushed out apparently beside herself with delight.

"Ah! what joy for the princess!" exclaimed she: "At last! I must let her know."

"No, no, please not... You are Mademoiselle Bourienne," said the little princess, kissing her. "I know you already through my sister-in-law's friendship for you. She was not expecting us?"

They went up to the door of the sitting room from which came the sound of the oft-repeated passage of the sonata. Prince Andrew stopped and made a grimace, as if expecting something unpleasant.

The little princess entered the room. The passage broke off in the middle, a cry was heard, then Princess Mary's heavy tread and the sound of kissing. When Prince Andrew went in the two princesses, who had only met once before for a short time at his wedding, were in each other's arms warmly pressing their lips to whatever place they happened to touch. Mademoiselle Bourienne stood near them pressing her hand to her heart, with a beatific smile and obviously equally ready to cry or to laugh. Prince Andrew shrugged his shoulders and frowned, as lovers of music do when they hear a false note. The two women let go of one another, and then, as if afraid of being too late, seized each other's hands, kissing them and pulling them away, and again began kissing each other on the face, and then to Prince Andrew's surprise both began to cry and kissed again. Mademoiselle Bourienne also began to cry. Prince Andrew evidently felt ill at ease, but to the two women it seemed quite natural that they should cry, and apparently it never entered their heads that it could have been otherwise at this meeting.

"Ah! my dear!... Ah! Mary!" they suddenly exclaimed, and then laughed. "I dreamed last night...--" "You were not expecting us?..."- "Ah! Mary, you have got thinner?..." "And you have grown stouter!..."

"I knew the princess at once," put in Mademoiselle Bourienne.

"And I had no idea!..." exclaimed Princess Mary. "Ah, Andrew, I did not see you."

Prince Andrew and his sister, hand in hand, kissed one another, and he told her she was still the same crybaby as ever. Princess Mary had turned toward her brother, and through her tears the loving, warm, gentle look of her large luminous eyes, very beautiful at that moment, rested on Prince Andrew's face.

The little princess talked incessantly, her short, downy upper lip continually and rapidly touching her rosy nether lip when necessary and drawing up again next moment when her face broke into a smile of glittering teeth and sparkling eyes. She told of an accident they had had on the Spasski Hill which might have been serious for her in her condition, and immediately after that informed them that she had left all her clothes in Petersburg and that heaven knew what she would have to dress in here; and that Andrew had quite changed, and that Kitty Odyntsova had married an old man, and that there was a suitor for Mary, a real one, but that they would talk of that later. Princess Mary was still looking silently at her brother and her beautiful eyes were full of love and sadness. It was plain that she was following a train of thought independent of her sister-in-law's words. In the midst of a description of the last Petersburg fete she addressed her brother:

"So you are really going to the war, Andrew?" she said sighing.

Lise sighed too.

"Yes, and even tomorrow," replied her brother.

"He is leaving me here, God knows why, when he might have had promotion..."

Princess Mary did not listen to the end, but continuing her train of thought turned to her sister-in-law with a tender glance at her figure.

"Is it certain?" she said.

The face of the little princess changed. She sighed and said:
"Yes, quite certain. Ah! it is very dreadful..."

Her lip descended. She brought her face close to her sister-in-law's and unexpectedly again began to cry.

"She needs rest," said Prince Andrew with a frown. "Don't you, Lise? Take her to your room and I'll go to Father. How is he? Just the same?"

"Yes, just the same. Though I don't know what your opinion will be," answered the princess joyfully.

"And are the hours the same? And the walks in the avenues? And the lathe?" asked Prince Andrew with a scarcely perceptible smile which showed that, in spite of all his love and respect for his father, he was aware of his weaknesses.

"The hours are the same, and the lathe, and also the mathematics and my geometry lessons," said Princess Mary gleefully, as if her lessons in geometry were among the greatest delights of her life.

When the twenty minutes had elapsed and the time had come for the old prince to get up, Tikhon came to call the young prince to his father. The old man made a departure from his usual routine in honor of his son's arrival: he gave orders to admit him to his apartments while he dressed for dinner. The old prince always dressed in old-fashioned style, wearing an antique coat and powdered hair; and when Prince Andrew entered his father's dressing room (not with the contemptuous look and manner he wore in drawing rooms, but with the animated face with which he talked to Pierre), the old man was sitting on a large leather-covered chair, wrapped in a powdering mantle, entrusting his head to Tikhon.

"Ah! here's the warrior! Wants to vanquish Buonaparte?" said the old man, shaking his powdered head as much as the tail, which Tikhon was holding fast to plait, would allow.

"You at least must tackle him properly, or else if he goes on like this he'll soon have us, too, for his subjects! How are you?" And he held out his cheek.

The old man was in a good temper after his nap before dinner. (He used to say that a nap "after dinner was silver--before dinner, golden.") He cast happy, sidelong glances at his son from under his thick, bushy eyebrows. Prince Andrew went up and kissed his father on the spot indicated to him. He made no reply on his father's favorite topic--making fun of the military men of the day, and more particularly of Bonaparte.

"Yes, Father, I have come to you and brought my wife who is pregnant," said Prince Andrew, following every movement of his father's face with an eager and respectful look. "How is your health?"

"Only fools and rakes fall ill, my boy. You know me: I am busy from morning till night and abstemious, so of course I am well."

"Thank God," said his son smiling.

"God has nothing to do with it! Well, go on," he continued, returning to his hobby; "tell me how the Germans have taught you to fight Bonaparte by this new science you call 'strategy.'"

Prince Andrew smiled.

"Give me time to collect my wits, Father," said he, with a smile that showed that his father's foibles did not prevent his son from loving and honoring him. "Why, I have not yet had time to settle down!"

"Nonsense, nonsense!" cried the old man, shaking his pigtail to see whether it was firmly plaited, and grasping his by the hand. "The house for your wife is ready. Princess Mary will take her there and show her over, and they'll talk nineteen to the dozen. That's their woman's way! I am glad to have her. Sit down and talk. About Mikhelson's army I understand--Tolstoy's too... a simultaneous expedition.... But what's the southern army to do? Prussia is neutral... I know that. What about Austria?" said he, rising from his chair and pacing up and down the room followed by Tikhon, who ran after him, handing him different articles of clothing. "What of Sweden? How will they cross Pomerania?"

Prince Andrew, seeing that his father insisted, began--at first reluctantly, but gradually with more and more animation, and from habit changing unconsciously from Russian to French as he went on--to explain the plan of operation for the coming campaign. He explained how an army, ninety thousand strong, was to threaten Prussia so as to bring her out of her neutrality and draw her into the war; how part of that army was to join some Swedish forces at Stralsund; how two hundred and twenty thousand Austrians, with a hundred thousand Russians, were to operate in Italy and on the Rhine; how fifty thousand Russians and as many English were to land at Naples, and how a total force of five hundred thousand men was to attack the French from different sides. The old prince did not evince the least interest during this explanation, but as if he were not listening to it continued to dress while walking about, and three times unexpectedly interrupted. Once he stopped it by shouting: "The white one, the white one!"

This meant that Tikhon was not handing him the waistcoat he wanted. Another time he interrupted, saying:

"And will she soon be confined?" and shaking his head reproachfully said: "That's bad! Go on, go on."

The third interruption came when Prince Andrew was finishing his description. The old man began to sing, in the cracked voice of old age: "Malbrook s'en va-t-en guerre. Dieu sait quand reviendra."*

*"Marlborough is going to the wars; God knows when he'll return."

His son only smiled.

"I don't say it's a plan I approve of," said the son; "I am only telling you what it is. Napoleon has also formed his plan by now, not worse than this one."

"Well, you've told me nothing new," and the old man repeated, meditatively and rapidly:

"Dieu sait quand reviendra. Go to the dining room."

CHAPTER XXVII

At the appointed hour the prince, powdered and shaven, entered the dining room where his daughter-in-law, Princess Mary, and Mademoiselle Bourienne were already awaiting him together with his architect, who by a strange caprice of his employer's was admitted to table though the position of that insignificant individual was such as could certainly not have caused him to expect that honor. The prince, who generally kept very strictly to social distinctions and rarely admitted even important government officials to his table, had unexpectedly selected Michael Ivanovich (who always went into a corner to blow his nose on his checked handkerchief) to illustrate the theory that all men are equals, and had more than once impressed on his daughter that Michael Ivanovich was "not a whit worse than you or I." At dinner the prince usually spoke to the taciturn Michael Ivanovich more often than to anyone else.

In the dining room, which like all the rooms in the house was exceedingly lofty, the members of the household and the footmen--one behind each chair--stood waiting for the prince to enter. The head butler, napkin on arm, was scanning the setting of the table, making signs to the footmen, and anxiously glancing from the clock to the door by which the prince was to enter. Prince Andrew was looking at a large gilt frame, new to him, containing the genealogical tree of the Princes Bolkonski, opposite which hung another such frame with a badly painted portrait (evidently by the hand of the artist belonging to the estate) of a ruling prince, in a crown--an alleged descendant of Rurik and ancestor of the Bolkonskis. Prince Andrew, looking again at that genealogical tree, shook his head, laughing as a man laughs who looks at a portrait so characteristic of the original as to be amusing.

"How thoroughly like him that is!" he said to Princess Mary, who had come up to him.

Princess Mary looked at her brother in surprise. She did not understand what he was laughing at. Everything her father did inspired her with reverence and was beyond question.

"Everyone has his Achilles' heel," continued Prince Andrew.
"Fancy, with his powerful mind, indulging in such nonsense!"

Princess Mary could not understand the boldness of her brother's criticism and was about to reply, when the expected footsteps were heard coming from the study. The prince walked in quickly and jauntily as was his wont, as if intentionally contrasting the briskness of his manners with the strict formality of his house. At that moment the great clock struck two and another with a shrill tone joined in from the drawing room. The prince stood still; his lively glittering eyes from under their thick, bushy eyebrows sternly scanned all present and rested on the little princess. She felt, as courtiers do when the Tsar enters, the sensation of fear and respect which the old man inspired in all around him. He stroked her hair and then patted her awkwardly on the back of her neck.

"I'm glad, glad, to see you," he said, looking attentively into her eyes, and then quickly went to his place and sat down. "Sit down, sit down! Sit down, Michael Ivanovich!"

He indicated a place beside him to his daughter-in-law. A footman moved the chair for her.

"Ho, ho!" said the old man, casting his eyes on her rounded figure. "You've been in a hurry. That's bad!"

He laughed in his usual dry, cold, unpleasant way, with his lips only and not with his eyes.

"You must walk, walk as much as possible, as much as possible," he said.

The little princess did not, or did not wish to, hear his words. She was silent and seemed confused. The prince asked her about her father, and she began to smile and talk. He asked about mutual acquaintances, and she became still more animated and chattered away giving him greetings from various people and retailing the town gossip.

"Countess Apraksina, poor thing, has lost her husband and she has cried her eyes out," she said, growing more and more lively.

As she became animated the prince looked at her more and more sternly, and suddenly, as if he had studied her sufficiently and had formed a definite idea of her, he turned away and addressed Michael Ivanovich.

"Well, Michael Ivanovich, our Bonaparte will be having a bad time of it. Prince Andrew" (he always spoke thus of his son) "has been telling me what forces are being collected against him! While you and I never thought much of him."

Michael Ivanovich did not at all know when "you and I" had said such things about Bonaparte, but understanding that he was wanted as a peg on which to hang the prince's favorite topic, he looked inquiringly at the young prince, wondering what would follow.

"He is a great tactician!" said the prince to his son, pointing to the architect.

And the conversation again turned on the war, on Bonaparte, and the generals and statesmen of the day. The old prince seemed convinced not only that all the men of the day were mere babies who did not know the A B C of war or of politics, and that Bonaparte was an insignificant little Frenchy, successful only because there were no longer any Potemkins or Suvorovs left to oppose him; but he was also convinced that there were no political difficulties in Europe and no real war, but only a sort of puppet show at which the men of the day were playing, pretending to do something real. Prince Andrew gaily bore with his father's ridicule of the new men, and drew him on and listened to him with evident pleasure.

"The past always seems good," said he, "but did not Suvorov himself fall into a trap Moreau set him, and from which he did not know how to escape?"

"Who told you that? Who?" cried the prince. "Suvorov!" And he jerked away his plate, which Tikhon briskly caught. "Suvorov!... Consider, Prince Andrew. Two... Frederick and Suvorov; Moreau!... Moreau would have been a prisoner if Suvorov had had a free hand; but he had the Hofs-kriegs-wurst-schnapps-Rath on his hands. It would have puzzled the devil himself! When you get there you'll find out what those Hofs-kriegs-wurst-Raths are! Suvorov couldn't manage them so what chance has Michael Kutuzov? No, my dear boy," he continued, "you and your generals won't get on against Buonaparte; you'll have to call in the French, so that birds of a feather may fight together. The German, Pahlen, has been sent to New York in America, to fetch the Frenchman, Moreau," he said, alluding to the invitation made that year to Moreau to enter the Russian service.... "Wonderful!... Were the Potemkins, Suvorovs, and Orlovs Germans? No, lad, either you fellows have all lost your wits, or I have outlived mine. May God help you, but we'll see what will happen. Buonaparte has become a great commander among them! Hm!..."

"I don't at all say that all the plans are good," said Prince Andrew, "I am only surprised at your opinion of Bonaparte. You may

laugh as much as you like, but all the same Bonaparte is a great general!"

"Michael Ivanovich!" cried the old prince to the architect who, busy with his roast meat, hoped he had been forgotten: "Didn't I tell you Buonaparte was a great tactician? Here, he says the same thing."

"To be sure, your excellency." replied the architect.

The prince again laughed his frigid laugh.

"Buonaparte was born with a silver spoon in his mouth. He has got splendid soldiers. Besides he began by attacking Germans. And only idlers have failed to beat the Germans. Since the world began everybody has beaten the Germans. They beat no one--except one another. He made his reputation fighting them."

And the prince began explaining all the blunders which, according to him, Bonaparte had made in his campaigns and even in politics. His son made no rejoinder, but it was evident that whatever arguments were presented he was as little able as his father to change his opinion. He listened, refraining from a reply, and involuntarily wondered how this old man, living alone in the country for so many years, could know and discuss so minutely and acutely all the recent European military and political events.

"You think I'm an old man and don't understand the present state of affairs?" concluded his father. "But it troubles me. I don't sleep at night. Come now, where has this great commander of yours shown his skill?" he concluded.

"That would take too long to tell," answered the son.

"Well, then go to your Buonaparte! Mademoiselle Bourienne, here's another admirer of that powder-monkey emperor of yours," he exclaimed in excellent French.

"You know, Prince, I am not a Bonapartist!"

"Dieu sait quand reviendra..." hummed the prince out of tune and, with a laugh still more so, he quitted the table.

The little princess during the whole discussion and the rest of the dinner sat silent, glancing with a frightened look now at her father-in-law and now at Princess Mary. When they left the table she took her sister-in-law's arm and drew her into another room.

"What a clever man your father is," said she; "perhaps that is why I am afraid of him."

"Oh, he is so kind!" answered Princess Mary.

CHAPTER XXVIII

Prince Andrew was to leave next evening. The old prince, not altering his routine, retired as usual after dinner. The little princess was in her sister-in-law's room. Prince Andrew in a traveling coat without epaulettes had been packing with his valet in the rooms assigned to him. After inspecting the carriage himself and seeing the trunks put in, he ordered the horses to be harnessed. Only those things he always kept with him remained in his room; a small box, a large canteen fitted with silver plate, two Turkish pistols and a saber--a present from his father who had brought it from the siege of Ochakov. All these traveling effects of Prince Andrew's were in very good order: new, clean, and in cloth covers carefully tied with

tapes.

When starting on a journey or changing their mode of life, men capable of reflection are generally in a serious frame of mind. At such moments one reviews the past and plans for the future. Prince Andrew's face looked very thoughtful and tender. With his hands behind him he paced briskly from corner to corner of the room, looking straight before him and thoughtfully shaking his head. Did he fear going to the war, or was he sad at leaving his wife?--perhaps both, but evidently he did not wish to be seen in that mood, for hearing footsteps in the passage he hurriedly unclasped his hands, stopped at a table as if tying the cover of the small box, and assumed his usual tranquil and impenetrable expression. It was the heavy tread of Princess Mary that he heard.

"I hear you have given orders to harness," she cried, panting (she had apparently been running), "and I did so wish to have another talk with you alone! God knows how long we may again be parted. You are not angry with me for coming? You have changed so, Andrusha," she added, as if to explain such a question.

She smiled as she uttered his pet name, "Andrusha." It was obviously strange to her to think that this stern handsome man should be Andrusha--the slender mischievous boy who had been her playfellow in childhood.

"And where is Lise?" he asked, answering her question only by a smile.

"She was so tired that she has fallen asleep on the sofa in my room. Oh, Andrew! What a treasure of a wife you have," said she, sitting down on the sofa, facing her brother. "She is quite a child: such a dear, merry child. I have grown so fond of her."

Prince Andrew was silent, but the princess noticed the ironical and contemptuous look that showed itself on his face.

"One must be indulgent to little weaknesses; who is free from them, Andrew? Don't forget that she has grown up and been educated in society, and so her position now is not a rosy one. We should enter into everyone's situation. Tout comprendre, c'est tout pardonner.* Think it must be for her, poor thing, after what she has been used to, to be parted from her husband and be left alone in the country, in her condition! It's very hard."

*To understand all is to forgive all.

Prince Andrew smiled as he looked at his sister, as we smile at those we think we thoroughly understand.

"You live in the country and don't think the life terrible," he replied.

"I... that's different. Why speak of me? I don't want any other life, and can't, for I know no other. But think, Andrew: for a young society woman to be buried in the country during the best years of her life, all alone--for Papa is always busy, and I... well, you know what poor resources I have for entertaining a woman used to the best society. There is only Mademoiselle Bourienne...."

"I don't like your Mademoiselle Bourienne at all," said Prince Andrew.

"No? She is very nice and kind and, above all, she's much to be pitied. She has no one, no one. To tell the truth, I don't need her, and she's even in my way. You know I always was a savage, and now am even more so. I like being alone.... Father likes her very much. She and Michael Ivanovich are the two people to whom he is always gentle

and kind, because he has been a benefactor to them both. As Sterne says: 'We don't love people so much for the good they have done us, as for the good we have done them.' Father took her when she was homeless after losing her own father. She is very good-natured, and my father likes her way of reading. She reads to him in the evenings and reads splendidly."

"To be quite frank, Mary, I expect Father's character sometimes makes things trying for you, doesn't it?" Prince Andrew asked suddenly.

Princess Mary was first surprised and then aghast at this question.

"For me? For me?... Trying for me!..." said she.

"He always was rather harsh; and now I should think he's getting very trying," said Prince Andrew, apparently speaking lightly of their father in order to puzzle or test his sister.

"You are good in every way, Andrew, but you have a kind of intellectual pride," said the princess, following the train of her own thoughts rather than the trend of the conversation--"and that's a great sin. How can one judge Father? But even if one might, what feeling except veneration could such a man as my father evoke? And I am so contented and happy with him. I only wish you were all as happy as I am."

Her brother shook his head incredulously.

"The only thing that is hard for me... I will tell you the truth, Andrew... is Father's way of treating religious subjects. I don't understand how a man of his immense intellect can fail to see what is as clear as day, and can go so far astray. That is the only thing that makes me unhappy. But even in this I can see lately a shade of improvement. His satire has been less bitter of late, and there was a monk he received and had a long talk with."

"Ah! my dear, I am afraid you and your monk are wasting your powder," said Prince Andrew banteringly yet tenderly.

"Ah! mon ami, I only pray, and hope that God will hear me. Andrew..." she said timidly after a moment's silence, "I have a great favor to ask of you."

"What is it, dear?"

"No--promise that you will not refuse! It will give you no trouble and is nothing unworthy of you, but it will comfort me. Promise, Andrusha!..." said she, putting her hand in her reticule but not yet taking out what she was holding inside it, as if what she held were the subject of her request and must not be shown before the request was granted.

She looked timidly at her brother.

"Even if it were a great deal of trouble..." answered Prince Andrew, as if guessing what it was about.

"Think what you please! I know you are just like Father. Think as you please, but do this for my sake! Please do! Father's father, our grandfather, wore it in all his wars." (She still did not take out what she was holding in her reticule.) "So you promise?"

"Of course. What is it?"

"Andrew, I bless you with this icon and you must promise me you will never take it off. Do you promise?"

"If it does not weigh a hundredweight and won't break my neck... To please you..." said Prince Andrew. But immediately, noticing the

pained expression his joke had brought to his sister's face, he repented and added: "I am glad; really, dear, I am very glad."

"Against your will He will save and have mercy on you and bring you to Himself, for in Him alone is truth and peace," said she in a voice trembling with emotion, solemnly holding up in both hands before her brother a small, oval, antique, dark-faced icon of the Saviour in a gold setting, on a finely wrought silver chain.

She crossed herself, kissed the icon, and handed it to Andrew.

"Please, Andrew, for my sake!..."

Rays of gentle light shone from her large, timid eyes. Those eyes lit up the whole of her thin, sickly face and made it beautiful. Her brother would have taken the icon, but she stopped him. Andrew understood, crossed himself and kissed the icon. There was a look of tenderness, for he was touched, but also a gleam of irony on his face.

"Thank you, my dear." She kissed him on the forehead and sat down again on the sofa. They were silent for a while.

"As I was saying to you, Andrew, be kind and generous as you always used to be. Don't judge Lise harshly," she began. "She is so sweet, so good-natured, and her position now is a very hard one."

"I do not think I have complained of my wife to you, Masha, or blamed her. Why do you say all this to me?"

Red patches appeared on Princess Mary's face and she was silent as if she felt guilty.

"I have said nothing to you, but you have already been talked to. And I am sorry for that," he went on.

The patches grew deeper on her forehead, neck, and cheeks. She tried to say something but could not. Her brother had guessed right: the little princess had been crying after dinner and had spoken of her forebodings about her confinement, and how she dreaded it, and had complained of her fate, her father-in-law, and her husband. After crying she had fallen asleep. Prince Andrew felt sorry for his sister.

"Know this, Masha: I can't reproach, have not reproached, and never shall reproach my wife with anything, and I cannot reproach myself with anything in regard to her; and that always will be so in whatever circumstances I may be placed. But if you want to know the truth... if you want to know whether I am happy? No! Is she happy? No! But why this is so I don't know..."

As he said this he rose, went to his sister, and, stooping, kissed her forehead. His fine eyes lit up with a thoughtful, kindly, and unaccustomed brightness, but he was looking not at his sister but over her head toward the darkness of the open doorway.

"Let us go to her, I must say good-by. Or--go and wake and I'll come in a moment. Petrushka!" he called to his valet: "Come here, take these away. Put this on the seat and this to the right."

Princess Mary rose and moved to the door, then stopped and said: "Andrew, if you had faith you would have turned to God and asked Him to give you the love you do not feel, and your prayer would have been answered."

"Well, may be!" said Prince Andrew. "Go, Masha; I'll come immediately."

On the way to his sister's room, in the passage which connected one wing with the other, Prince Andrew met Mademoiselle Bourienne smiling sweetly. It was the third time that day that, with an ecstatic and artless smile, she had met him in secluded passages.

"Oh! I thought you were in your room," she said, for some reason blushing and dropping her eyes.

Prince Andrew looked sternly at her and an expression of anger suddenly came over his face. He said nothing to her but looked at her forehead and hair, without looking at her eyes, with such contempt that the Frenchwoman blushed and went away without a word. When he reached his sister's room his wife was already awake and her merry voice, hurrying one word after another, came through the open door. She was speaking as usual in French, and as if after long self-restraint she wished to make up for lost time.

"No, but imagine the old Countess Zubova, with false curls and her mouth full of false teeth, as if she were trying to cheat old age.... Ha, ha, ha! Mary!"

This very sentence about Countess Zubova and this same laugh Prince Andrew had already heard from his wife in the presence of others some five times. He entered the room softly. The little princess, plump and rosy, was sitting in an easy chair with her work in her hands, talking incessantly, repeating Petersburg reminiscences and even phrases. Prince Andrew came up, stroked her hair, and asked if she felt rested after their journey. She answered him and continued her chatter.

The coach with six horses was waiting at the porch. It was an autumn night, so dark that the coachman could not see the carriage pole. Servants with lanterns were bustling about in the porch. The immense house was brilliant with lights shining through its lofty windows. The domestic serfs were crowding in the hall, waiting to bid good-by to the young prince. The members of the household were all gathered in the reception hall: Michael Ivanovich, Mademoiselle Bourienne, Princess Mary, and the little princess. Prince Andrew had been called to his father's study as the latter wished to say good-by to him alone. All were waiting for them to come out.

When Prince Andrew entered the study the old man in his old-age spectacles and white dressing gown, in which he received no one but his son, sat at the table writing. He glanced round.

"Going?" And he went on writing.

"I've come to say good-by."

"Kiss me here," and he touched his cheek: "Thanks, thanks!"

"What do you thank me for?"

"For not dilly-dallying and not hanging to a woman's apron strings. The Service before everything. Thanks, thanks!" And he went on writing, so that his quill spluttered and squeaked. "If you have anything to say, say it. These two things can be done together," he added.

"About my wife... I am ashamed as it is to leave her on your hands..."

"Why talk nonsense? Say what you want."

"When her confinement is due, send to Moscow for an accoucheur.... Let him be here...."

The old prince stopped writing and, as if not understanding, fixed his stern eyes on his son.

"I know that no one can help if nature does not do her work," said Prince Andrew, evidently confused. "I know that out of a million cases only one goes wrong, but it is her fancy and mine. They have been telling her things. She has had a dream and is frightened."

"Hm... Hm..." muttered the old prince to himself, finishing what he was writing. "I'll do it."

He signed with a flourish and suddenly turning to his son began to laugh.

"It's a bad business, eh?"

"What is bad, Father?"

"The wife!" said the old prince, briefly and significantly.

"I don't understand!" said Prince Andrew.

"No, it can't be helped, lad," said the prince. "They're all like that; one can't unmarry. Don't be afraid; I won't tell anyone, but you know it yourself."

He seized his son by the hand with small bony fingers, shook it, looked straight into his son's face with keen eyes which seemed to see through him, and again laughed his frigid laugh.

The son sighed, thus admitting that his father had understood him. The old man continued to fold and seal his letter, snatching up and throwing down the wax, the seal, and the paper, with his accustomed rapidity.

"What's to be done? She's pretty! I will do everything. Make your mind easy," said he in abrupt sentences while sealing his letter.

Andrew did not speak; he was both pleased and displeased that his father understood him. The old man got up and gave the letter to his son.

"Listen!" said he; "don't worry about your wife: what can be done shall be. Now listen! Give this letter to Michael Ilarionovich.* I have written that he should make use of you in proper places and not keep you long as an adjutant: a bad position! Tell him I remember and like him. Write and tell me how he receives you. If he is all right--serve him. Nicholas Bolkonski's son need not serve under anyone if he is in disfavor. Now come here."

*Kutuzov.

He spoke so rapidly that he did not finish half his words, but his son was accustomed to understand him. He led him to the desk, raised the lid, drew out a drawer, and took out an exercise book filled with his bold, tall, close handwriting.

"I shall probably die before you. So remember, these are my memoirs; hand them to the Emperor after my death. Now here is a Lombard bond and a letter; it is a premium for the man who writes a history of Suvorov's wars. Send it to the Academy. Here are some jottings for you to read when I am gone. You will find them useful."

Andrew did not tell his father that he would no doubt live a long time yet. He felt that he must not say it.

"I will do it all, Father," he said.

"Well, now, good-by!" He gave his son his hand to kiss, and embraced him. "Remember this, Prince Andrew, if they kill you it will hurt me, your old father..." he paused unexpectedly, and then in a querulous voice suddenly shrieked: "but if I hear that you have not behaved like a son of Nicholas Bolkonski, I shall be ashamed!"

"You need not have said that to me, Father," said the son with a

smile.

The old man was silent.

"I also wanted to ask you," continued Prince Andrew, "if I'm killed and if I have a son, do not let him be taken away from you-as I said yesterday... let him grow up with you.... Please."

"Not let the wife have him?" said the old man, and laughed.

They stood silent, facing one another. The old man's sharp eyes were fixed straight on his son's. Something twitched in the lower part of the old prince's face.

"We've said good-by. Go!" he suddenly shouted in a loud, angry voice, opening his door.

"What is it? What?" asked both princesses when they saw for a moment at the door Prince Andrew and the figure of the old man in a white dressing gown, spectacled and wigless, shouting in an angry voice.

Prince Andrew sighed and made no reply.

"Well!" he said, turning to his wife.

And this "Well!" sounded coldly ironic, as if he were saying,:
"Now go through your performance."

"Andrew, already!" said the little princess, turning pale and looking with dismay at her husband.

He embraced her. She screamed and fell unconscious on his shoulder.

He cautiously released the shoulder she leaned on, looked into her face, and carefully placed her in an easy chair.

"Adieu, Mary," said he gently to his sister, taking her by the hand and kissing her, and then he left the room with rapid steps.

The little princess lay in the armchair, Mademoiselle Bourienne chafing her temples. Princess Mary, supporting her sister-in-law, still looked with her beautiful eyes full of tears at the door through which Prince Andrew had gone and made the sign of the cross in his direction. From the study, like pistol shots, came the frequent sound of the old man angrily blowing his nose. Hardly had Prince Andrew gone when the study door opened quickly and the stern figure of the old man in the white dressing gown looked out.

"Gone? That's all right!" said he; and looking angrily at the unconscious little princess, he shook his head reprovingly and slammed the door.

BOOK TWO: 1805

CHAPTER I

In October, 1805, a Russian army was occupying the villages and towns of the Archduchy of Austria, and yet other regiments freshly arriving from Russia were settling near the fortress of Braunau and burdening the inhabitants on whom they were quartered. Braunau was the headquarters of the commander-in-chief, Kutuzov.

On October 11, 1805, one of the infantry regiments that had just reached Braunau had halted half a mile from the town, waiting to be inspected by the commander in chief. Despite the un-Russian appearance of the locality and surroundings--fruit gardens, stone fences, tiled roofs, and hills in the distance--and despite the fact that the inhabitants (who gazed with curiosity at the soldiers) were not Russians, the regiment had just the appearance of any Russian regiment preparing for an inspection anywhere in the heart of Russia.

On the evening of the last day's march an order had been received that the commander in chief would inspect the regiment on the march. Though the words of the order were not clear to the regimental commander, and the question arose whether the troops were to be in marching order or not, it was decided at a consultation between the battalion commanders to present the regiment in parade order, on the principle that it is always better to "bow too low than not bow low enough." So the soldiers, after a twenty-mile march, were kept mending and cleaning all night long without closing their eyes, while the adjutants and company commanders calculated and reckoned, and by morning the regiment--instead of the straggling, disorderly crowd it had been on its last march the day before--presented a well-ordered array of two thousand men each of whom knew his place and his duty, had every button and every strap in place, and shone with cleanliness. And not only externally was all in order, but had it pleased the commander in chief to look under the uniforms he would have found on every man a clean shirt, and in every knapsack the appointed number of articles, "awl, soap, and all," as the soldiers say. There was only one circumstance concerning which no one could be at ease. It was the state of the soldiers' boots. More than half the men's boots were in holes. But this defect was not due to any fault of the regimental commander, for in spite of repeated demands boots had not been issued by the Austrian commissariat, and the regiment had marched some seven hundred miles.

The commander of the regiment was an elderly, choleric, stout, and thick-set general with grizzled eyebrows and whiskers, and wider from chest to back than across the shoulders. He had on a brand-new uniform showing the creases where it had been folded and thick gold epaulettes which seemed to stand rather than lie down on his massive shoulders. He had the air of a man happily performing one of the most solemn duties of his life. He walked about in front of the line and at every step pulled himself up, slightly arching his back. It was plain that the commander admired his regiment, rejoiced in it, and that his whole mind was engrossed by it, yet his strut seemed to indicate that, besides military matters, social interests and the fair sex occupied no small part of his thoughts.

"Well, Michael Mitrich, sir?" he said, addressing one of the battalion commanders who smilingly pressed forward (it was plain that they both felt happy). "We had our hands full last night. However, I think the regiment is not a bad one, eh?"

The battalion commander perceived the jovial irony and laughed.

"It would not be turned off the field even on the Tsaritsin Meadow."

"What?" asked the commander.

At that moment, on the road from the town on which signalers had been posted, two men appeared on horse back. They were an aide-de-camp followed by a Cossack.

The aide-de-camp was sent to confirm the order which had not been clearly worded the day before, namely, that the commander in chief wished to see the regiment just in the state in which it had been on the march: in their greatcoats, and packs, and without any preparation whatever.

A member of the Hofkriegsrath from Vienna had come to Kutuzov the

day before with proposals and demands for him to join up with the army of the Archduke Ferdinand and Mack, and Kutuzov, not considering this junction advisable, meant, among other arguments in support of his view, to show the Austrian general the wretched state in which the troops arrived from Russia. With this object he intended to meet the regiment; so the worse the condition it was in, the better pleased the commander in chief would be. Though the aide-de-camp did not know these circumstances, he nevertheless delivered the definite order that the men should be in their greatcoats and in marching order, and that the commander in chief would otherwise be dissatisfied. On hearing this the regimental commander hung his head, silently shrugged his shoulders, and spread out his arms with a choleric gesture.

"A fine mess we've made of it!" he remarked.

"There now! Didn't I tell you, Michael Mitrich, that if it was said 'on the march' it meant in greatcoats?" said he reproachfully to the battalion commander. "Oh, my God!" he added, stepping resolutely forward. "Company commanders!" he shouted in a voice accustomed to command. "Sergeants major!... How soon will he be here?" he asked the aide-de-camp with a respectful politeness evidently relating to the personage he was referring to.

"In an hour's time, I should say."

"Shall we have time to change clothes?"

"I don't know, General...."

The regimental commander, going up to the line himself, ordered the soldiers to change into their greatcoats. The company commanders ran off to their companies, the sergeants major began bustling (the greatcoats were not in very good condition), and instantly the squares that had up to then been in regular order and silent began to sway and stretch and hum with voices. On all sides soldiers were running to and fro, throwing up their knapsacks with a jerk of their shoulders and pulling the straps over their heads, unstrapping their overcoats and drawing the sleeves on with upraised arms.

In half an hour all was again in order, only the squares had become gray instead of black. The regimental commander walked with his jerky steps to the front of the regiment and examined it from a distance.

"Whatever is this? This!" he shouted and stood still. "Commander of the third company!"

"Commander of the third company wanted by the general.... commander to the general... third company to the commander." The words passed along the lines and an adjutant ran to look for the missing officer.

When the eager but misrepeated words had reached their destination in a cry of: "The general to the third company," the missing officer appeared from behind his company and, though he was a middle-aged man and not in the habit of running, trotted awkwardly stumbling on his toes toward the general. The captain's face showed the uneasiness of a schoolboy who is told to repeat a lesson he has not learned. Spots appeared on his nose, the redness of which was evidently due to intemperance, and his mouth twitched nervously. The general looked the captain up and down as he came up panting, slackening his pace as he approached.

"You will soon be dressing your men in petticoats! What is this?" shouted the regimental commander, thrusting forward his jaw and pointing at a soldier in the ranks of the third company in a greatcoat of bluish cloth, which contrasted with the others. "What have you been after? The commander in chief is expected and you leave your place? Eh? I'll teach you to dress the men in fancy coats for a parade.... Eh...?"

The commander of the company, with his eyes fixed on his superior, pressed two fingers more and more rigidly to his cap, as if in this pressure lay his only hope of salvation.

"Well, why don't you speak? Whom have you got there dressed up as a Hungarian?" said the commander with an austere gibe.

"Your excellency..."

"Well, your excellency, what? Your excellency! But what about your excellency?... nobody knows."

"Your excellency, it's the officer Dolokhov, who has been reduced to the ranks," said the captain softly.

"Well? Has he been degraded into a field marshal, or into a soldier? If a soldier, he should be dressed in regulation uniform like the others."

"Your excellency, you gave him leave yourself, on the march."

"Gave him leave? Leave? That's just like you young men," said the regimental commander cooling down a little. "Leave indeed.... One says a word to you and you... What?" he added with renewed irritation, "I beg you to dress your men decently."

And the commander, turning to look at the adjutant, directed his jerky steps down the line. He was evidently pleased at his own display of anger and walking up to the regiment wished to find a further excuse for wrath. Having snapped at an officer for an unpolished badge, at another because his line was not straight, he reached the third company.

"H-o-o-w are you standing? Where's your leg? Your leg?" shouted the commander with a tone of suffering in his voice, while there were still five men between him and Dolokhov with his bluish-gray uniform.

Dolokhov slowly straightened his bent knee, looking straight with his clear, insolent eyes in the general's face.

"Why a blue coat? Off with it... Sergeant major! Change his coat... the ras..." he did not finish.

"General, I must obey orders, but I am not bound to endure..." Dolokhov hurriedly interrupted.

"No talking in the ranks!... No talking, no talking!"

"Not bound to endure insults," Dolokhov concluded in loud, ringing tones.

The eyes of the general and the soldier met. The general became silent, angrily pulling down his tight scarf.

"I request you to have the goodness to change your coat," he said as he turned away.

CHAPTER II

"He's coming!" shouted the signaller at that moment.

The regimental commander, flushing, ran to his horse, seized the stirrup with trembling hands, threw his body across the saddle,

righted himself, drew his saber, and with a happy and resolute countenance, opening his mouth awry, prepared to shout. The regiment fluttered like a bird preening its plumage and became motionless.

"Att-ention!" shouted the regimental commander in a soul-shaking voice which expressed joy for himself, severity for the regiment, and welcome for the approaching chief.

Along the broad country road, edged on both sides by trees, came a high, light blue Viennese caleche, slightly creaking on its springs and drawn by six horses at a smart trot. Behind the caleche galloped the suite and a convoy of Croats. Beside Kutuzov sat an Austrian general, in a white uniform that looked strange among the Russian black ones. The caleche stopped in front of the regiment. Kutuzov and the Austrian general were talking in low voices and Kutuzov smiled slightly as treading heavily he stepped down from the carriage just as if those two thousand men breathlessly gazing at him and the regimental commander did not exist.

The word of command rang out, and again the regiment quivered, as with a jingling sound it presented arms. Then amidst a dead silence the feeble voice of the commander in chief was heard. The regiment roared, "Health to your ex... len... len... lency!" and again all became silent. At first Kutuzov stood still while the regiment moved; then he and the general in white, accompanied by the suite, walked between the ranks.

From the way the regimental commander saluted the commander in chief and devoured him with his eyes, drawing himself up obsequiously, and from the way he walked through the ranks behind the generals, bending forward and hardly able to restrain his jerky movements, and from the way he darted forward at every word or gesture of the commander in chief, it was evident that he performed his duty as a subordinate with even greater zeal than his duty as a commander. Thanks to the strictness and assiduity of its commander the regiment, in comparison with others that had reached Braunau at the same time, was in splendid condition. There were only 217 sick and stragglers. Everything was in good order except the boots.

Kutuzov walked through the ranks, sometimes stopping to say a few friendly words to officers he had known in the Turkish war, sometimes also to the soldiers. Looking at their boots he several times shook his head sadly, pointing them out to the Austrian general with an expression which seemed to say that he was not blaming anyone, but could not help noticing what a bad state of things it was. The regimental commander ran forward on each such occasion, fearing to miss a single word of the commander in chief's regarding the regiment. Behind Kutuzov, at a distance that allowed every softly spoken word to be heard, followed some twenty men of his suite. These gentlemen talked among themselves and sometimes laughed. Nearest of all to the commander in chief walked a handsome adjutant. This was Prince Bolkonski. Beside him was his comrade Nesvitski, a tall staff officer, extremely stout, with a kindly, smiling, handsome face and moist eyes. Nesvitski could hardly keep from laughter provoked by a swarthy hussar officer who walked beside him. This hussar, with a grave face and without a smile or a change in the expression of his fixed eyes, watched the regimental commander's back and mimicked his every movement. Each time the commander started and bent forward, the hussar started and bent forward in exactly the same manner. Nesvitski laughed and nudged the others to make them look at the wag.

Kutuzov walked slowly and languidly past thousands of eyes which were starting from their sockets to watch their chief. On reaching the third company he suddenly stopped. His suite, not having expected this, involuntarily came closer to him.

"Ah, Timokhin!" said he, recognizing the red-nosed captain who had been reprimanded on account of the blue greatcoat.

One would have thought it impossible for a man to stretch himself

more than Timokhin had done when he was reprimanded by the regimental commander, but now that the commander in chief addressed him he drew himself up to such an extent that it seemed he could not have sustained it had the commander in chief continued to look at him, and so Kutuzov, who evidently understood his case and wished him nothing but good, quickly turned away, a scarcely perceptible smile flitting over his scarred and puffy face.

"Another Ismail comrade," said he. "A brave officer! Are you satisfied with him?" he asked the regimental commander.

And the latter--unconscious that he was being reflected in the hussar officer as in a looking glass--started, moved forward, and answered: "Highly satisfied, your excellency!"

"We all have our weaknesses," said Kutuzov smiling and walking away from him. "He used to have a predilection for Bacchus."

The regimental commander was afraid he might be blamed for this and did not answer. The hussar at that moment noticed the face of the red-nosed captain and his drawn-in stomach, and mimicked his expression and pose with such exactitude that Nesvitski could not help laughing. Kutuzov turned round. The officer evidently had complete control of his face, and while Kutuzov was turning managed to make a grimace and then assume a most serious, deferential, and innocent expression.

The third company was the last, and Kutuzov pondered, apparently trying to recollect something. Prince Andrew stepped forward from among the suite and said in French:

"You told me to remind you of the officer Dolokhov, reduced to the ranks in this regiment."

"Where is Dolokhov?" asked Kutuzov.

Dolokhov, who had already changed into a soldier's gray greatcoat, did not wait to be called. The shapely figure of the fair-haired soldier, with his clear blue eyes, stepped forward from the ranks, went up to the commander in chief, and presented arms.

"Have you a complaint to make?" Kutuzov asked with a slight frown.

"This is Dolokhov," said Prince Andrew.

"Ah!" said Kutuzov. "I hope this will be a lesson to you. Do your duty. The Emperor is gracious, and I shan't forget you if you deserve well."

The clear blue eyes looked at the commander in chief just as boldly as they had looked at the regimental commander, seeming by their expression to tear open the veil of convention that separates a commander in chief so widely from a private.

"One thing I ask of your excellency," Dolokhov said in his firm, ringing, deliberate voice. "I ask an opportunity to atone for my fault and prove my devotion to His Majesty the Emperor and to Russia!"

Kutuzov turned away. The same smile of the eyes with which he had turned from Captain Timokhin again flitted over his face. He turned away with a grimace as if to say that everything Dolokhov had said to him and everything he could say had long been known to him, that he was weary of it and it was not at all what he wanted. He turned away and went to the carriage.

The regiment broke up into companies, which went to their appointed quarters near Braunau, where they hoped to receive boots and clothes and to rest after their hard marches.

"You won't bear me a grudge, Prokhor Ignatych?" said the

regimental commander, overtaking the third company on its way to its quarters and riding up to Captain Timokhin who was walking in front. (The regimental commander's face now that the inspection was happily over beamed with irrepressible delight.) "It's in the Emperor's service... it can't be helped... one is sometimes a bit hasty on parade... I am the first to apologize, you know me!... He was very pleased!" And he held out his hand to the captain.

"Don't mention it, General, as if I'd be so bold!" replied the captain, his nose growing redder as he gave a smile which showed where two front teeth were missing that had been knocked out by the butt end of a gun at Ismail.

"And tell Mr. Dolokhov that I won't forget him--he may be quite easy. And tell me, please--I've been meaning to ask--how is to ask--how is he behaving himself, and in general..."

"As far as the service goes he is quite punctilious, your excellency; but his character..." said Timokhin.

"And what about his character?" asked the regimental commander.

"It's different on different days," answered the captain. "One day he is sensible, well educated, and good-natured, and the next he's a wild beast.... In Poland, if you please, he nearly killed a Jew."

"Oh, well, well!" remarked the regimental commander. "Still, one must have pity on a young man in misfortune. You know he has important connections... Well, then, you just..."

"I will, your excellency," said Timokhin, showing by his smile that he understood his commander's wish.

"Well, of course, of course!"

The regimental commander sought out Dolokhov in the ranks and, reining in his horse, said to him:

"After the next affair... epaulettes."

Dolokhov looked round but did not say anything, nor did the mocking smile on his lips change.

"Well, that's all right," continued the regimental commander. "A cup of vodka for the men from me," he added so that the soldiers could hear. "I thank you all! God be praised!" and he rode past that company and overtook the next one.

"Well, he's really a good fellow, one can serve under him," said Timokhin to the subaltern beside him.

"In a word, a hearty one..." said the subaltern, laughing (the regimental commander was nicknamed King of Hearts).

The cheerful mood of their officers after the inspection infected the soldiers. The company marched on gaily. The soldiers' voices could be heard on every side.

"And they said Kutuzov was blind of one eye?"

"And so he is! Quite blind!"

"No, friend, he is sharper-eyed than you are. Boots and leg bands... he noticed everything..."

"When he looked at my feet, friend... well, thinks I..."

"And that other one with him, the Austrian, looked as if he were smeared with chalk--as white as flour! I suppose they polish him up as they do the guns."

"I say, Fedeshon!... Did he say when the battles are to begin? You were near him. Everybody said that Buonaparte himself was at Braunau."

"Buonaparte himself!... Just listen to the fool, what he doesn't know! The Prussians are up in arms now. The Austrians, you see, are putting them down. When they've been put down, the war with Buonaparte will begin. And he says Buonaparte is in Braunau! Shows you're a fool. You'd better listen more carefully!"

"What devils these quartermasters are! See, the fifth company is turning into the village already... they will have their buckwheat cooked before we reach our quarters."

"Give me a biscuit, you devil!"

"And did you give me tobacco yesterday? That's just it, friend! Ah, well, never mind, here you are."

"They might call a halt here or we'll have to do another four miles without eating."

"Wasn't it fine when those Germans gave us lifts! You just sit still and are drawn along."

"And here, friend, the people are quite beggarly. There they all seemed to be Poles--all under the Russian crown--but here they're all regular Germans."

"Singers to the front " came the captain's order.

And from the different ranks some twenty men ran to the front. A drummer, their leader, turned round facing the singers, and flourishing his arm, began a long-drawn-out soldiers' song, commencing with the words: "Morning dawned, the sun was rising," and concluding: "On then, brothers, on to glory, led by Father

Kamenski." This song had been composed in the Turkish campaign and now being sung in Austria, the only change being that the words "Father Kamenski" were replaced by "Father Kutuzov."

Having jerked out these last words as soldiers do and waved his arms as if flinging something to the ground, the drummer--a lean, handsome soldier of forty--looked sternly at the singers and screwed up his eyes. Then having satisfied himself that all eyes were fixed on him, he raised both arms as if carefully lifting some invisible but precious object above his head and, holding it there for some seconds, suddenly flung it down and began:

"Oh, my bower, oh, my bower...!"

"Oh, my bower new...!" chimed in twenty voices, and the castanet player, in spite of the burden of his equipment, rushed out to the front and, walking backwards before the company, jerked his shoulders and flourished his castanets as if threatening someone. The soldiers, swinging their arms and keeping time spontaneously, marched with long steps. Behind the company the sound of wheels, the creaking of springs, and the tramp of horses' hoofs were heard. Kutuzov and his suite were returning to the town. The commander in chief made a sign that the men should continue to march at ease, and he and all his suite showed pleasure at the sound of the singing and the sight of the dancing soldier and the gay and smartly marching men. In the second file from the right flank, beside which the carriage passed the company, a blue-eyed soldier involuntarily attracted notice. It was Dolokhov marching with particular grace and boldness in time to the song and looking at those driving past as if he pitied all who were not at that moment marching with the company. The hussar cornet of Kutuzov's suite who had mimicked the regimental commander, fell back from the carriage and rode up to Dolokhov.

Hussar cornet Zherkov had at one time, in Petersburg, belonged to the wild set led by Dolokhov. Zherkov had met Dolokhov abroad as a private and had not seen fit to recognize him. But now that Kutuzov had spoken to the gentleman ranker, he addressed him with the cordiality of an old friend.

"My dear fellow, how are you?" said he through the singing, making his horse keep pace with the company.

"How am I?" Dolokhov answered coldly. "I am as you see."

The lively song gave a special flavor to the tone of free and easy gaiety with which Zherkov spoke, and to the intentional coldness of Dolokhov's reply.

"And how do you get on with the officers?" inquired Zherkov.

"All right. They are good fellows. And how have you wriggled onto the staff?"

"I was attached; I'm on duty."

Both were silent.

"She let the hawk fly upward from her wide right sleeve," went the song, arousing an involuntary sensation of courage and cheerfulness. Their conversation would probably have been different but for the effect of that song.

"Is it true that Austrians have been beaten?" asked Dolokhov.

"The devil only knows! They say so."

"I'm glad," answered Dolokhov briefly and clearly, as the song demanded.

"I say, come round some evening and we'll have a game of faro!" said Zherkov.

"Why, have you too much money?"

"Do come."

"I can't. I've sworn not to. I won't drink and won't play till I get reinstated."

"Well, that's only till the first engagement."

"We shall see."

They were again silent.

"Come if you need anything. One can at least be of use on the staff..."

Dolokhov smiled. "Don't trouble. If I want anything, I won't beg-I'll take it!"

"Well, never mind; I only..."

"And I only..."

"Good-by."

"Good health..."

"It's a long, long way.
To my native land..."

Zherkov touched his horse with the spurs; it pranced excitedly from foot to foot uncertain with which to start, then settled down, galloped past the company, and overtook the carriage, still keeping time to the song.

CHAPTER III

On returning from the review, Kutuzov took the Austrian general into his private room and, calling his adjutant, asked for some papers relating to the condition of the troops on their arrival, and the letters that had come from the Archduke Ferdinand, who was in command of the advanced army. Prince Andrew Bolkonski came into the room with the required papers. Kutuzov and the Austrian member of the Hofkriegsrath were sitting at the table on which a plan was spread out.

"Ah!..." said Kutuzov glancing at Bolkonski as if by this exclamation he was asking the adjutant to wait, and he went on with the conversation in French.

"All I can say, General," said he with a pleasant elegance of expression and intonation that obliged one to listen to each deliberately spoken word. It was evident that Kutuzov himself listened with pleasure to his own voice. "All I can say, General, is that if the matter depended on my personal wishes, the will of His Majesty the Emperor Francis would have been fulfilled long ago. I should long ago have joined the archduke. And believe me on my honour that to me personally it would be a pleasure to hand over the supreme command of the army into the hands of a better informed and more skillful general--of whom Austria has so many--and to lay down all this heavy responsibility. But circumstances are sometimes too strong for us, General."

And Kutuzov smiled in a way that seemed to say, "You are quite at liberty not to believe me and I don't even care whether you do or not, but you have no grounds for telling me so. And that is the whole point."

The Austrian general looked dissatisfied, but had no option but to reply in the same tone.

"On the contrary," he said, in a querulous and angry tone that contrasted with his flattering words, "on the contrary, your excellency's participation in the common action is highly valued by His Majesty; but we think the present delay is depriving the splendid Russian troops and their commander of the laurels they have been accustomed to win in their battles," he concluded his evidently prearranged sentence.

Kutuzov bowed with the same smile.

"But that is my conviction, and judging by the last letter with which His Highness the Archduke Ferdinand has honored me, I imagine that the Austrian troops, under the direction of so skillful a leader as General Mack, have by now already gained a decisive victory and no longer need our aid," said Kutuzov.

The general frowned. Though there was no definite news of an Austrian defeat, there were many circumstances confirming the unfavorable rumors that were afloat, and so Kutuzov's suggestion of an Austrian victory sounded much like irony. But Kutuzov went on blandly smiling with the same expression, which seemed to say that he had a right to suppose so. And, in fact, the last letter he had received from Mack's army informed him of a victory and stated strategically the position of the army was very favorable.

"Give me that letter," said Kutuzov turning to Prince Andrew.
"Please have a look at it"--and Kutuzov with an ironical smile about
the corners of his mouth read to the Austrian general the following
passage, in German, from the Archduke Ferdinand's letter:

We have fully concentrated forces of nearly seventy thousand men
with which to attack and defeat the enemy should he cross the Lech.
Also, as we are masters of Ulm, we cannot be deprived of the advantage
of commanding both sides of the Danube, so that should the enemy not
cross the Lech, we can cross the Danube, throw ourselves on his line
of communications, recross the river lower down, and frustrate his
intention should he try to direct his whole force against our faithful
ally. We shall therefore confidently await the moment when the
Imperial Russian army will be fully equipped, and shall then, in
conjunction with it, easily find a way to prepare for the enemy the
fate he deserves.

Kutuzov sighed deeply on finishing this paragraph and looked at
the member of the Hofkriegsrath mildly and attentively.

"But you know the wise maxim your excellency, advising one to expect
the worst," said the Austrian general, evidently wishing to have
done with jests and to come to business. He involuntarily looked round
at the aide-de-camp.

"Excuse me, General," interrupted Kutuzov, also turning to Prince
Andrew. "Look here, my dear fellow, get from Kozlovski all the reports
from our scouts. Here are two letters from Count Nostitz and here is
one from His Highness the Archduke Ferdinand and here are these," he
said, handing him several papers, "make a neat memorandum in French
out of all this, showing all the news we have had of the movements
of the Austrian army, and then give it to his excellency."

Prince Andrew bowed his head in token of having understood from
the first not only what had been said but also what Kutuzov would have
liked to tell him. He gathered up the papers and with a bow to both,
stepped softly over the carpet and went out into the waiting room.

Though not much time had passed since Prince Andrew had left Russia,
he had changed greatly during that period. In the expression of his
face, in his movements, in his walk, scarcely a trace was left of
his former affected languor and indolence. He now looked like a man
who has time to think of the impression he makes on others, but is
occupied with agreeable and interesting work. His face expressed
more satisfaction with himself and those around him, his smile and
glance were brighter and more attractive.

Kutuzov, whom he had overtaken in Poland, had received him very
kindly, promised not to forget him, distinguished him above the
other adjutants, and had taken him to Vienna and given him the more
serious commissions. From Vienna Kutuzov wrote to his old comrade,
Prince Andrew's father.

Your son bids fair to become an officer distinguished by his
industry, firmness, and expedition. I consider myself fortunate to
have such a subordinate by me.

On Kutuzov's staff, among his fellow officers and in the army
generally, Prince Andrew had, as he had had in Petersburg society, two
quite opposite reputations. Some, a minority, acknowledged him to be
different from themselves and from everyone else, expected great
things of him, listened to him, admired, and imitated him, and with
them Prince Andrew was natural and pleasant. Others, the majority,
disliked him and considered him conceited, cold, and disagreeable. But
among these people Prince Andrew knew how to take his stand so that

they respected and even feared him.

Coming out of Kutuzov's room into the waiting room with the papers in his hand Prince Andrew came up to his comrade, the aide-de-camp on duty, Kozlovski, who was sitting at the window with a book.

"Well, Prince?" asked Kozlovski.

"I am ordered to write a memorandum explaining why we are not advancing."

"And why is it?"

Prince Andrew shrugged his shoulders.

"Any news from Mack?"

"No."

"If it were true that he has been beaten, news would have come."

"Probably," said Prince Andrew moving toward the outer door.

But at that instant a tall Austrian general in a greatcoat, with the order of Maria Theresa on his neck and a black bandage round his head, who had evidently just arrived, entered quickly, slamming the door. Prince Andrew stopped short.

"Commander in Chief Kutuzov?" said the newly arrived general speaking quickly with a harsh German accent, looking to both sides and advancing straight toward the inner door.

"The commander in chief is engaged," said Kozlovski, going hurriedly up to the unknown general and blocking his way to the door. "Whom shall I announce?"

The unknown general looked disdainfully down at Kozlovski, who was rather short, as if surprised that anyone should know him.

"The commander in chief is engaged," repeated Kozlovski calmly.

The general's face clouded, his lips quivered and trembled. He took out a notebook, hurriedly scribbled something in pencil, tore out the leaf, gave it to Kozlovski, stepped quickly to the window, and threw himself into a chair, gazing at those in the room as if asking, "Why do they look at me?" Then he lifted his head, stretched his neck as if he intended to say something, but immediately, with affected indifference, began to hum to himself, producing a queer sound which immediately broke off. The door of the private room opened and Kutuzov appeared in the doorway. The general with the bandaged head bent forward as though running away from some danger, and, making long, quick strides with his thin legs, went up to Kutuzov.

"Vous voyez le malheureux Mack," he uttered in a broken voice.

Kutuzov's face as he stood in the open doorway remained perfectly immobile for a few moments. Then wrinkles ran over his face like a wave and his forehead became smooth again, he bowed his head respectfully, closed his eyes, silently let Mack enter his room before him, and closed the door himself behind him.

The report which had been circulated that the Austrians had been beaten and that the whole army had surrendered at Ulm proved to be correct. Within half an hour adjutants had been sent in various directions with orders which showed that the Russian troops, who had hitherto been inactive, would also soon have to meet the enemy.

Prince Andrew was one of those rare staff officers whose chief interest lay in the general progress of the war. When he saw Mack and heard the details of his disaster he understood that half the

campaign was lost, understood all the difficulties of the Russian army's position, and vividly imagined what awaited it and the part he would have to play. Involuntarily he felt a joyful agitation at the thought of the humiliation of arrogant Austria and that in a week's time he might, perhaps, see and take part in the first Russian encounter with the French since Suvorov met them. He feared that Bonaparte's genius might outweigh all the courage of the Russian troops, and at the same time could not admit the idea of his hero being disgraced.

Excited and irritated by these thoughts Prince Andrew went toward his room to write to his father, to whom he wrote every day. In the corridor he met Nesvitski, with whom he shared a room, and the wag Zherkov; they were as usual laughing.

"Why are you so glum?" asked Nesvitski noticing Prince Andrew's pale face and glittering eyes.

"There's nothing to be gay about," answered Bolkonski.

Just as Prince Andrew met Nesvitski and Zherkov, there came toward them from the other end of the corridor, Strauch, an Austrian general who on Kutuzov's staff in charge of the provisioning of the Russian army, and the member of the Hofkriegsrath who had arrived the previous evening. There was room enough in the wide corridor for the generals to pass the three officers quite easily, but Zherkov, pushing Nesvitski aside with his arm, said in a breathless voice,

"They're coming!... they're coming!... Stand aside, make way, please make way!"

The generals were passing by, looking as if they wished to avoid embarrassing attentions. On the face of the wag Zherkov there suddenly appeared a stupid smile of glee which he seemed unable to suppress.

"Your excellency," said he in German, stepping forward and addressing the Austrian general, "I have the honor to congratulate you."

He bowed his head and scraped first with one foot and then with the other, awkwardly, like a child at a dancing lesson.

The member of the Hofkriegsrath looked at him severely but, seeing the seriousness of his stupid smile, could not but give him a moment's attention. He screwed up his eyes showing that he was listening.

"I have the honor to congratulate you. General Mack has arrived, quite well, only a little bruised just here," he added, pointing with a beaming smile to his head.

The general frowned, turned away, and went on.

"Gott, wie naiv!"* said he angrily, after he had gone a few steps.

*"Good God, what simplicity!"

Nesvitski with a laugh threw his arms round Prince Andrew, but Bolkonski, turning still paler, pushed him away with an angry look and turned to Zherkov. The nervous irritation aroused by the appearance of Mack, the news of his defeat, and the thought of what lay before the Russian army found vent in anger at Zherkov's untimely jest.

"If you, sir, choose to make a buffoon of yourself," he said sharply, with a slight trembling of the lower jaw, "I can't prevent your doing so; but I warn you that if you dare to play the fool in my presence, I will teach you to behave yourself."

Nesvitski and Zherkov were so surprised by this outburst that they gazed at Bolkonski silently with wide-open eyes.

"What's the matter? I only congratulated them," said Zherkov.

"I am not jesting with you; please be silent!" cried Bolkonski, and taking Nesvitski's arm he left Zherkov, who did not know what to say.

"Come, what's the matter, old fellow?" said Nesvitski trying to soothe him.

"What's the matter?" exclaimed Prince Andrew standing still in his excitement. "Don't you understand that either we are officers serving our Tsar and our country, rejoicing in the successes and grieving at the misfortunes of our common cause, or we are merely lackeys who care nothing for their master's business. Quarante mille hommes massacres et l'armee de nos allies detruite, et vous trouvez la le mot pour rire,"* he said, as if strengthening his views by this French sentence. "C'est bien pour un garcon de rein comme cet individu dont vous avez fait un ami, mais pas pour vous, pas pour vous.*[2] Only a hobbledehoy could amuse himself in this way," he added in Russian--but pronouncing the word with a French accent--having noticed that Zherkov could still hear him.

*"Forty thousand men massacred and the army of our allies destroyed, and you find that a cause for jesting!"

*[2] "It is all very well for that good-for-nothing fellow of whom you have made a friend, but not for you, not for you."

He waited a moment to see whether the cornet would answer, but he turned and went out of the corridor.

CHAPTER IV

The Pavlograd Hussars were stationed two miles from Braunau. The squadron in which Nicholas Rostov served as a cadet was quartered in the German village of Salzeneck. The best quarters in the village were assigned to cavalry-captain Denisov, the squadron commander, known throughout the whole cavalry division as Vaska Denisov. Cadet Rostov, ever since he had overtaken the regiment in Poland, had lived with the squadron commander.

On October 11, the day when all was astir at headquarters over the news of Mack's defeat, the camp life of the officers of this squadron was proceeding as usual. Denisov, who had been losing at cards all night, had not yet come home when Rostov rode back early in the morning from a foraging expedition. Rostov in his cadet uniform, with a jerk to his horse, rode up to the porch, swung his leg over the saddle with a supple youthful movement, stood for a moment in the stirrup as if loathe to part from his horse, and at last sprang down and called to his orderly.

"Ah, Bondarenko, dear friend!" said he to the hussar who rushed up headlong to the horse. "Walk him up and down, my dear fellow," he continued, with that gay brotherly cordiality which goodhearted young people show to everyone when they are happy.

"Yes, your excellency," answered the Ukrainian gaily, tossing his head.

"Mind, walk him up and down well!"

Another hussar also rushed toward the horse, but Bondarenko had

already thrown the reins of the snaffle bridle over the horse's head. It was evident that the cadet was liberal with his tips and that it paid to serve him. Rostov patted the horse's neck and then his flank, and lingered for a moment.

"Splendid! What a horse he will be!" he thought with a smile, and holding up his saber, his spurs jingling, he ran up the steps of the porch. His landlord, who in a waistcoat and a pointed cap, pitchfork in hand, was clearing manure from the cowhouse, looked out, and his face immediately brightened on seeing Rostov. "Schon gut Morgen! Schon gut Morgen!"* he said winking with a merry smile, evidently pleased to greet the young man.

*"A very good morning! A very good morning!"

"Schon fleissig?"* said Rostov with the same gay brotherly smile which did not leave his eager face. "Hoch Oestreicher! Hoch Russen! Kaiser Alexander hoch!"*[2] said he, quoting words often repeated by the German landlord.

*"Busy already?"

*[2] "Hurrah for the Austrians! Hurrah for the Russians! Hurrah for Emperor Alexander!"

The German laughed, came out of the cowshed, pulled off his cap, and waving it above his head cried:

"Und die ganze Welt hoch!"*

*"And hurrah for the whole world!"

Rostov waved his cap above his head like the German and cried laughing, "Und vivat die ganze Welt!" Though neither the German cleaning his cowshed nor Rostov back with his platoon from foraging for hay had any reason for rejoicing, they looked at each other with joyful delight and brotherly love, wagged their heads in token of their mutual affection, and parted smiling, the German returning to his cowshed and Rostov going to the cottage he occupied with Denisov.

"What about your master?" he asked Lavrushka, Denisov's orderly, whom all the regiment knew for a rogue.

"Hasn't been in since the evening. Must have been losing," answered Lavrushka. "I know by now, if he wins he comes back early to brag about it, but if he stays out till morning it means he's lost and will come back in a rage. Will you have coffee?"

"Yes, bring some."

Ten minutes later Lavrushka brought the coffee. "He's coming!" said he. "Now for trouble!" Rostov looked out of the window and saw Denisov coming home. Denisov was a small man with a red face, sparkling black eyes, and black tousled mustache and hair. He wore an unfastened cloak, wide breeches hanging down in creases, and a crumpled shako on the back of his head. He came up to the porch gloomily, hanging his head.

"Lavwuska!" he shouted loudly and angrily, "take it off, blockhead!"

"Well, I am taking it off," replied Lavrushka's voice.

"Ah, you're up already," said Denisov, entering the room.

"Long ago," answered Rostov, "I have already been for the hay, and have seen Fraulein Mathilde."

"Weally! And I've been losing, bwother. I lost yesterday like a damned fool!" cried Denisov, not pronouncing his r's. "Such ill luck! Such ill luck. As soon as you left, it began and went on. Hullo there! Tea!"

Puckering up his face though smiling, and showing his short strong teeth, he began with stubby fingers of both hands to ruffle up his thick tangled black hair.

"And what devil made me go to that wat?" (an officer nicknamed "the rat") he said, rubbing his forehead and whole face with both hands. "Just fancy, he didn't let me win a single cahd, not one cahd."

He took the lighted pipe that was offered to him, gripped it in his fist, and tapped it on the floor, making the sparks fly, while he continued to shout.

"He lets one win the singles and collahs it as soon as one doubles it; gives the singles and snatches the doubles!"

He scattered the burning tobacco, smashed the pipe, and threw it away. Then he remained silent for a while, and all at once looked cheerfully with his glittering, black eyes at Rostov.

"If at least we had some women here; but there's nothing foh one to do but dwink. If we could only get to fighting soon. Hullo, who's there?" he said, turning to the door as he heard a tread of heavy boots and the clinking of spurs that came to a stop, and a respectful cough.

"The squadron quartermaster!" said Lavrushka.

Denisov's face puckered still more.

"Wretched!" he muttered, throwing down a purse with some gold in it. "Wostov, deah fellow, just see how much there is left and shove the purse undah the pillow," he said, and went out to the quartermaster.

Rostov took the money and, mechanically arranging the old and new coins in separate piles, began counting them.

"Ah! Telyanin! How d'ye do? They plucked me last night," came Denisov's voice from the next room.

"Where? At Bykov's, at the rat's... I knew it," replied a piping voice, and Lieutenant Telyanin, a small officer of the same squadron, entered the room.

Rostov thrust the purse under the pillow and shook the damp little hand which was offered him. Telyanin for some reason had been transferred from the Guards just before this campaign. He behaved very well in the regiment but was not liked; Rostov especially detested him and was unable to overcome or conceal his groundless antipathy to the man.

"Well, young cavalryman, how is my Rook behaving?" he asked. (Rook was a young horse Telyanin had sold to Rostov.)

The lieutenant never looked the man he was speaking to straight in the face; his eyes continually wandered from one object to another.

"I saw you riding this morning..." he added.

"Oh, he's all right, a good horse," answered Rostov, though the horse for which he had paid seven hundred rubbles was not worth half that sum. "He's begun to go a little lame on the left foreleg," he

added.

"The hoof's cracked! That's nothing. I'll teach you what to do and show you what kind of rivet to use."

"Yes, please do," said Rostov.

"I'll show you, I'll show you! It's not a secret. And it's a horse you'll thank me for."

"Then I'll have it brought round," said Rostov wishing to avoid Telyanin, and he went out to give the order.

In the passage Denisov, with a pipe, was squatting on the threshold facing the quartermaster who was reporting to him. On seeing Rostov, Denisov screwed up his face and pointing over his shoulder with his thumb to the room where Telyanin was sitting, he frowned and gave a shudder of disgust.

"Ugh! I don't like that fellow," he said, regardless of the quartermaster's presence.

Rostov shrugged his shoulders as much as to say: "Nor do I, but what's one to do?" and, having given his order, he returned to Telyanin.

Telyanin was sitting in the same indolent pose in which Rostov had left him, rubbing his small white hands.

"Well there certainly are disgusting people," thought Rostov as he entered.

"Have you told them to bring the horse?" asked Telyanin, getting up and looking carelessly about him.

"I have."

"Let us go ourselves. I only came round to ask Denisov about yesterday's order. Have you got it, Denisov?"

"Not yet. But where are you off to?"

"I want to teach this young man how to shoe a horse," said Telyanin.

They went through the porch and into the stable. The lieutenant explained how to rivet the hoof and went away to his own quarters.

When Rostov went back there was a bottle of vodka and a sausage on the table. Denisov was sitting there scratching with his pen on a sheet of paper. He looked gloomily in Rostov's face and said: "I am waiting to her."

He leaned his elbows on the table with his pen in his hand and, evidently glad of a chance to say quicker in words what he wanted to write, told Rostov the contents of his letter.

"You see, my friend," he said, "we sleep when we don't love. We are children of the dust... but one falls in love and one is a God, one is pure as on the first day of creation... Who's that now? Send him to the devil, I'm busy!" he shouted to Lavrushka, who went up to him not in the least abashed.

"Who should it be? You yourself told him to come. It's the quartermaster for the money."

Denisov frowned and was about to shout some reply but stopped.

"Wretched business," he muttered to himself. "How much is left in the purse?" he asked, turning to Rostov.

"Seven new and three old imperials."

"Oh, it's wretched! Well, what are you standing there for, you sca'cwow? Call the quahtehmasteh," he shouted to Lavrushka.

"Please, Denisov, let me lend you some: I have some, you know," said Rostov, blushing.

"Don't like bowwowing from my own fellows, I don't," growled Denisov.

"But if you won't accept money from me like a comrade, you will offend me. Really I have some," Rostov repeated.

"No, I tell you."

And Denisov went to the bed to get the purse from under the pillow.

"Where have you put it, Wostov?"

"Under the lower pillow."

"It's not there."

Denisov threw both pillows on the floor. The purse was not there.

"That's a miwacle."

"Wait, haven't you dropped it?" said Rostov, picking up the pillows one at a time and shaking them.

He pulled off the quilt and shook it. The purse was not there.

"Dear me, can I have forgotten? No, I remember thinking that you kept it under your head like a treasure," said Rostov. "I put it just here. Where is it?" he asked, turning to Lavrushka.

"I haven't been in the room. It must be where you put it."

"But it isn't?..."

"You're always like that; you thwow a thing down anywhere and forget it. Feel in your pockets."

"No, if I hadn't thought of it being a treasure," said Rostov, "but I remember putting it there."

Lavrushka turned all the bedding over, looked under the bed and under the table, searched everywhere, and stood still in the middle of the room. Denisov silently watched Lavrushka's movements, and when the latter threw up his arms in surprise saying it was nowhere to be found Denisov glanced at Rostov.

"Wostov, you've not been playing schoolboy twicks..."

Rostov felt Denisov's gaze fixed on him, raised his eyes, and instantly dropped them again. All the blood which had seemed congested somewhere below his throat rushed to his face and eyes. He could not draw breath.

"And there hasn't been anyone in the room except the lieutenant and yourselves. It must be here somewhere," said Lavrushka.

"Now then, you devil's puppet, look alive and hunt for it!" shouted Denisov, suddenly, turning purple and rushing at the man with a threatening gesture. "If the purse isn't found I'll flog you, I'll flog you all."

Rostov, his eyes avoiding Denisov, began buttoning his coat, buckled on his saber, and put on his cap.

"I must have that purse, I tell you," shouted Denisov, shaking his orderly by the shoulders and knocking him against the wall.

"Denisov, let him alone, I know who has taken it," said Rostov, going toward the door without raising his eyes. Denisov paused, thought a moment, and, evidently understanding what Rostov hinted at, seized his arm.

"Nonsense!" he cried, and the veins on his forehead and neck stood out like cords. "You are mad, I tell you. I won't allow it. The purse is here! I'll flay this scoundrel alive, and it will be found."

"I know who has taken it," repeated Rostov in an unsteady voice, and went to the door.

"And I tell you, don't you dare to do it!" shouted Denisov, rushing at the cadet to restrain him.

But Rostov pulled away his arm and, with as much anger as though Denisov were his worst enemy, firmly fixed his eyes directly on his face.

"Do you understand what you're saying?" he said in a trembling voice. "There was no one else in the room except myself. So that if it is not so, then..."

He could not finish, and ran out of the room.

"Ah, may the devil take you and everybody," were the last words Rostov heard.

Rostov went to Telyanin's quarters.

"The master is not in, he's gone to headquarters," said Telyanin's orderly. "Has something happened?" he added, surprised at the cadet's troubled face.

"No, nothing."

"You've only just missed him," said the orderly.

The headquarters were situated two miles away from Salzeneck, and Rostov, without returning home, took a horse and rode there. There was an inn in the village which the officers frequented. Rostov rode up to it and saw Telyanin's horse at the porch.

In the second room of the inn the lieutenant was sitting over a dish of sausages and a bottle of wine.

"Ah, you've come here too, young man!" he said, smiling and raising his eyebrows.

"Yes," said Rostov as if it cost him a great deal to utter the word; and he sat down at the nearest table.

Both were silent. There were two Germans and a Russian officer in the room. No one spoke and the only sounds heard were the clatter of knives and the munching of the lieutenant.

When Telyanin had finished his lunch he took out of his pocket a double purse and, drawing its rings aside with his small, white, turned-up fingers, drew out a gold imperial, and lifting his eyebrows gave it to the waiter.

"Please be quick," he said.

The coin was a new one. Rostov rose and went up to Telyanin.

"Allow me to look at your purse," he said in a low, almost

inaudible, voice.

With shifting eyes but eyebrows still raised, Telyanin handed him the purse.

"Yes, it's a nice purse. Yes, yes," he said, growing suddenly pale, and added, "Look at it, young man."

Rostov took the purse in his hand, examined it and the money in it, and looked at Telyanin. The lieutenant was looking about in his usual way and suddenly seemed to grow very merry.

"If we get to Vienna I'll get rid of it there but in these wretched little towns there's nowhere to spend it," said he. "Well, let me have it, young man, I'm going."

Rostov did not speak.

"And you? Are you going to have lunch too? They feed you quite decently here," continued Telyanin. "Now then, let me have it."

He stretched out his hand to take hold of the purse. Rostov let go of it. Telyanin took the purse and began carelessly slipping it into the pocket of his riding breeches, with his eyebrows lifted and his mouth slightly open, as if to say, "Yes, yes, I am putting my purse in my pocket and that's quite simple and is no else's business."

"Well, young man?" he said with a sigh, and from under his lifted brows he glanced into Rostov's eyes.

Some flash as of an electric spark shot from Telyanin's eyes to Rostov's and back, and back again and again in an instant.

"Come here," said Rostov, catching hold of Telyanin's arm and almost dragging him to the window. "That money is Denisov's; you took it..." he whispered just above Telyanin's ear.

"What? What? How dare you? What?" said Telyanin.

But these words came like a piteous, despairing cry and an entreaty for pardon. As soon as Rostov heard them, an enormous load of doubt fell from him. He was glad, and at the same instant began to pity the miserable man who stood before him, but the task he had begun had to be completed.

"Heaven only knows what the people here may imagine," muttered Telyanin, taking up his cap and moving toward a small empty room.
"We must have an explanation..."

"I know it and shall prove it," said Rostov.

"I..."

Every muscle of Telyanin's pale, terrified face began to quiver, his eyes still shifted from side to side but with a downward look not rising to Rostov's face, and his sobs were audible.

"Count!... Don't ruin a young fellow... here is this wretched money, take it..." He threw it on the table. "I have an old father and mother!..."

Rostov took the money, avoiding Telyanin's eyes, and went out of the room without a word. But at the door he stopped and then retraced his steps. "O God," he said with tears in his eyes, "how could you do it?"

"Count..." said Telyanin drawing nearer to him.

"Don't touch me," said Rostov, drawing back. "If you need it, take the money," and he threw the purse to him and ran out of the inn.

CHAPTER V

That same evening there was an animated discussion among the squadron's officers in Denisov's quarters.

"And I tell you, Rostov, that you must apologize to the colonel!" said a tall, grizzly-haired staff captain, with enormous mustaches and many wrinkles on his large features, to Rostov who was crimson with excitement.

The staff captain, Kirsten, had twice been reduced to the ranks for affairs of honor and had twice regained his commission.

"I will allow no one to call me a liar!" cried Rostov. "He told me I lied, and I told him he lied. And there it rests. He may keep me on duty every day, or may place me under arrest, but no one can make me apologize, because if he, as commander of this regiment, thinks it beneath his dignity to give me satisfaction, then..."

"You just wait a moment, my dear fellow, and listen," interrupted the staff captain in his deep bass, calmly stroking his long mustache. "You tell the colonel in the presence of other officers that an officer has stolen..."

"I'm not to blame that the conversation began in the presence of other officers. Perhaps I ought not to have spoken before them, but I am not a diplomatist. That's why I joined the hussars, thinking that here one would not need finesse; and he tells me that I am lying--so let him give me satisfaction..."

"That's all right. No one thinks you a coward, but that's not the point. Ask Denisov whether it is not out of the question for a cadet to demand satisfaction of his regimental commander?"

Denisov sat gloomily biting his mustache and listening to the conversation, evidently with no wish to take part in it. He answered the staff captain's question by a disapproving shake of his head.

"You speak to the colonel about this nasty business before other officers," continued the staff captain, "and Bogdanich" (the colonel was called Bogdanich) "shuts you up."

"He did not shut me up, he said I was telling an untruth."

"Well, have it so, and you talked a lot of nonsense to him and must apologize."

"Not on any account!" exclaimed Rostov.

"I did not expect this of you," said the staff captain seriously and severely. "You don't wish to apologize, but, man, it's not only to him but to the whole regiment--all of us--you're to blame all round. The case is this: you ought to have thought the matter over and taken advice; but no, you go and blurt it all straight out before the officers. Now what was the colonel to do? Have the officer tried and disgrace the whole regiment? Disgrace the whole regiment because of one scoundrel? Is that how you look at it? We don't see it like that. And Bogdanich was a brick: he told you you were saying what was not true. It's not pleasant, but what's to be done, my dear fellow? You landed yourself in it. And now, when one wants to smooth the thing over, some conceit prevents your apologizing, and you wish to make the whole affair public. You are offended at being put on duty a bit, but why not apologize to an old and honorable officer? Whatever Bogdanich may be, anyway he is an honorable and brave old colonel!"

You're quick at taking offense, but you don't mind disgracing the whole regiment!" The staff captain's voice began to tremble. "You have been in the regiment next to no time, my lad, you're here today and tomorrow you'll be appointed adjutant somewhere and can snap your fingers when it is said 'There are thieves among the Pavlograd officers!' But it's not all the same to us! Am I not right, Denisov? It's not the same!"

Denisov remained silent and did not move, but occasionally looked with his glittering black eyes at Rostov.

"You value your own pride and don't wish to apologize," continued the staff captain, "but we old fellows, who have grown up in and, God willing, are going to die in the regiment, we prize the honor of the regiment, and Bogdanich knows it. Oh, we do prize it, old fellow! And all this is not right, it's not right! You may take offense or not but I always stick to mother truth. It's not right!"

And the staff captain rose and turned away from Rostov.

"That's twue, devil take it!" shouted Denisov, jumping up. "Now then, Wostov, now then!"

Rostov, growing red and pale alternately, looked first at one officer and then at the other.

"No, gentlemen, no... you mustn't think... I quite understand. You're wrong to think that of me... I... for me... for the honor of the regiment I'd... Ah well, I'll show that in action, and for me the honor of the flag... Well, never mind, it's true I'm to blame, to blame all round. Well, what else do you want?..."

"Come, that's right, Count!" cried the staff captain, turning round and clapping Rostov on the shoulder with his big hand.

"I tell you," shouted Denisov, "he's a fine fellow."

"That's better, Count," said the staff captain, beginning to address Rostov by his title, as if in recognition of his confession. "Go and apologize, your excellency. Yes, go!"

"Gentlemen, I'll do anything. No one shall hear a word from me," said Rostov in an imploring voice, "but I can't apologize, by God I can't, do what you will! How can I go and apologize like a little boy asking forgiveness?"

Denisov began to laugh.

"It'll be worse for you. Bogdanich is vindictive and you'll pay for your obstinacy," said Kirsten.

"No, on my word it's not obstinacy! I can't describe the feeling. I can't..."

"Well, it's as you like," said the staff captain. "And what has become of that scoundrel?" he asked Denisov.

"He has reported himself sick, he's to be struck off the list tomorrow," muttered Denisov.

"It is an illness, there's no other way of explaining it," said the staff captain.

"Illness or not, he'd better not cross my path. I'd kill him!" shouted Denisov in a bloodthirsty tone.

Just then Zherkov entered the room.

"What brings you here?" cried the officers turning to the newcomer.

"We're to go into action, gentlemen! Mack has surrendered with his whole army."

"It's not true!"

"I've seen him myself!"

"What? Saw the real Mack? With hands and feet?"

"Into action! Into action! Bring him a bottle for such news! But how did you come here?"

"I've been sent back to the regiment all on account of that devil, Mack. An Austrian general complained of me. I congratulated him on Mack's arrival... What's the matter, Rostov? You look as if you'd just come out of a hot bath."

"Oh, my dear fellow, we're in such a stew here these last two days."

The regimental adjutant came in and confirmed the news brought by Zherkov. They were under orders to advance next day.

"We're going into action, gentlemen!"

"Well, thank God! We've been sitting here too long!"

CHAPTER VI

Kutuzov fell back toward Vienna, destroying behind him the bridges over the rivers Inn (at Braunau) and Traun (near Linz). On October 23 the Russian troops were crossing the river Enns. At midday the Russian baggage train, the artillery, and columns of troops were defiling through the town of Enns on both sides of the bridge.

It was a warm, rainy, autumnal day. The wide expanse that opened out before the heights on which the Russian batteries stood guarding the bridge was at times veiled by a diaphanous curtain of slanting rain, and then, suddenly spread out in the sunlight, far-distant objects could be clearly seen glittering as though freshly varnished. Down below, the little town could be seen with its white, red-roofed houses, its cathedral, and its bridge, on both sides of which streamed jostling masses of Russian troops. At the bend of the Danube, vessels, an island, and a castle with a park surrounded by the waters of the confluence of the Enns and the Danube became visible, and the rocky left bank of the Danube covered with pine forests, with a mystic background of green treetops and bluish gorges. The turrets of a convent stood out beyond a wild virgin pine forest, and far away on the other side of the Enns the enemy's horse patrols could be discerned.

Among the field guns on the brow of the hill the general in command of the rearguard stood with a staff officer, scanning the country through his fieldglass. A little behind them Nesvitski, who had been sent to the rearguard by the commander in chief, was sitting on the trail of a gun carriage. A Cossack who accompanied him had handed him a knapsack and a flask, and Nesvitski was treating some officers to pies and real doppelkummel. The officers gladly gathered round him, some on their knees, some squatting Turkish fashion on the wet grass.

"Yes, the Austrian prince who built that castle was no fool. It's a fine place! Why are you not eating anything, gentlemen?" Nesvitski was saying.

"Thank you very much, Prince," answered one of the officers, pleased

to be talking to a staff officer of such importance. "It's a lovely place! We passed close to the park and saw two deer... and what a splendid house!"

"Look, Prince," said another, who would have dearly liked to take another pie but felt shy, and therefore pretended to be examining the countryside--"See, our infantrymen have already got there. Look there in the meadow behind the village, three of them are dragging something. They'll ransack that castle," he remarked with evident approval.

"So they will," said Nesvitski. "No, but what I should like," added he, munching a pie in his moist-lipped handsome mouth, "would be to slip in over there."

He pointed with a smile to a turreted nunnery, and his eyes narrowed and gleamed.

"That would be fine, gentlemen!"

The officers laughed.

"Just to flutter the nuns a bit. They say there are Italian girls among them. On my word I'd give five years of my life for it!"

"They must be feeling dull, too," said one of the bolder officers, laughing.

Meanwhile the staff officer standing in front pointed out something to the general, who looked through his field glass.

"Yes, so it is, so it is," said the general angrily, lowering the field glass and shrugging his shoulders, "so it is! They'll be fired on at the crossing. And why are they dawdling there?"

On the opposite side the enemy could be seen by the naked eye, and from their battery a milk-white cloud arose. Then came the distant report of a shot, and our troops could be seen hurrying to the crossing.

Nesvitski rose, puffing, and went up to the general, smiling.

"Would not your excellency like a little refreshment?" he said.

"It's a bad business," said the general without answering him, "our men have been wasting time."

"Hadn't I better ride over, your excellency?" asked Nesvitski.

"Yes, please do," answered the general, and he repeated the order that had already once been given in detail: "and tell the hussars that they are to cross last and to fire the bridge as I ordered; and the inflammable material on the bridge must be reinspected."

"Very good," answered Nesvitski.

He called the Cossack with his horse, told him to put away the knapsack and flask, and swung his heavy person easily into the saddle.

"I'll really call in on the nuns," he said to the officers who watched him smilingly, and he rode off by the winding path down the hill.

"Now then, let's see how far it will carry, Captain. Just try!" said the general, turning to an artillery officer. "Have a little fun to pass the time."

"Crew, to your guns!" commanded the officer.

In a moment the men came running gaily from their campfires and

began loading.

"One!" came the command.

Number one jumped briskly aside. The gun rang out with a deafening metallic roar, and a whistling grenade flew above the heads of our troops below the hill and fell far short of the enemy, a little smoke showing the spot where it burst.

The faces of officers and men brightened up at the sound. Everyone got up and began watching the movements of our troops below, as plainly visible as if but a stone's throw away, and the movements of the approaching enemy farther off. At the same instant the sun came fully out from behind the clouds, and the clear sound of the solitary shot and the brilliance of the bright sunshine merged in a single joyous and spirited impression.

CHAPTER VII

Two of the enemy's shots had already flown across the bridge, where there was a crush. Halfway across stood Prince Nesvitski, who had alighted from his horse and whose big body was jammed against the railings. He looked back laughing to the Cossack who stood a few steps behind him holding two horses by their bridles. Each time Prince Nesvitski tried to move on, soldiers and carts pushed him back again and pressed him against the railings, and all he could do was to smile.

"What a fine fellow you are, friend!" said the Cossack to a convoy soldier with a wagon, who was pressing onto the infantrymen who were crowded together close to his wheels and his horses. "What a fellow! You can't wait a moment! Don't you see the general wants to pass?"

But the convoyman took no notice of the word "general" and shouted at the soldiers who were blocking his way. "Hi there, boys! Keep to the left! Wait a bit." But the soldiers, crowded together shoulder to shoulder, their bayonets interlocking, moved over the bridge in a dense mass. Looking down over the rails Prince Nesvitski saw the rapid, noisy little waves of the Enns, which rippling and eddying round the piles of the bridge chased each other along. Looking on the bridge he saw equally uniform living waves of soldiers, shoulder straps, covered shakos, knapsacks, bayonets, long muskets, and, under the shakos, faces with broad cheekbones, sunken cheeks, and listless tired expressions, and feet that moved through the sticky mud that covered the planks of the bridge. Sometimes through the monotonous waves of men, like a flock of white foam on the waves of the Enns, an officer, in a cloak and with a type of face different from that of the men, squeezed his way along; sometimes like a chip of wood whirling in the river, an hussar on foot, an orderly, or a townsman was carried through the waves of infantry; and sometimes like a log floating down the river, an officers' or company's baggage wagon, piled high, leather covered, and hemmed in on all sides, moved across the bridge.

"It's as if a dam had burst," said the Cossack hopelessly. "Are there many more of you to come?"

"A million all but one!" replied a waggish soldier in a torn coat, with a wink, and passed on followed by another, an old man.

"If he" (he meant the enemy) "begins popping at the bridge now," said the old soldier dismally to a comrade, "you'll forget to scratch yourself."

That soldier passed on, and after him came another sitting on a

cart.

"Where the devil have the leg bands been shoved to?" said an orderly, running behind the cart and fumbling in the back of it.

And he also passed on with the wagon. Then came some merry soldiers who had evidently been drinking.

"And then, old fellow, he gives him one in the teeth with the butt end of his gun..." a soldier whose greatcoat was well tucked up said gaily, with a wide swing of his arm.

"Yes, the ham was just delicious..." answered another with a loud laugh. And they, too, passed on, so that Nesvitski did not learn who had been struck on the teeth, or what the ham had to do with it.

"Bah! How they scurry. He just sends a ball and they think they'll all be killed," a sergeant was saying angrily and reproachfully.

"As it flies past me, Daddy, the ball I mean," said a young soldier with an enormous mouth, hardly refraining from laughing, "I felt like dying of fright. I did, 'pon my word, I got that frightened!" said he, as if bragging of having been frightened.

That one also passed. Then followed a cart unlike any that had gone before. It was a German cart with a pair of horses led by a German, and seemed loaded with a whole houseful of effects. A fine brindled cow with a large udder was attached to the cart behind. A woman with an unweaned baby, an old woman, and a healthy German girl with bright red cheeks were sitting on some feather beds. Evidently these fugitives were allowed to pass by special permission. The eyes of all the soldiers turned toward the women, and while the vehicle was passing at foot pace all the soldiers' remarks related to the two young ones. Every face bore almost the same smile, expressing unseemly thoughts about the women.

"Just see, the German sausage is making tracks, too!"

"Sell me the missis," said another soldier, addressing the German, who, angry and frightened, strode energetically along with downcast eyes.

"See how smart she's made herself! Oh, the devils!"

"There, Fedotov, you should be quartered on them!"

"I have seen as much before now, mate!"

"Where are you going?" asked an infantry officer who was eating an apple, also half smiling as he looked at the handsome girl.

The German closed his eyes, signifying that he did not understand.

"Take it if you like," said the officer, giving the girl an apple.

The girl smiled and took it. Nesvitski like the rest of the men on the bridge did not take his eyes off the women till they had passed. When they had gone by, the same stream of soldiers followed, with the same kind of talk, and at last all stopped. As often happens, the horses of a convoy wagon became restive at the end of the bridge, and the whole crowd had to wait.

"And why are they stopping? There's no proper order!" said the soldiers. "Where are you shoving to? Devil take you! Can't you wait? It'll be worse if he fires the bridge. See, here's an officer jammed in too"--different voices were saying in the crowd, as the men looked at one another, and all pressed toward the exit from the bridge.

Looking down at the waters of the Enns under the bridge, Nesvitski

suddenly heard a sound new to him, of something swiftly approaching... something big, that splashed into the water.

"Just see where it carries to!" a soldier near by said sternly, looking round at the sound.

"Encouraging us to get along quicker," said another uneasily.

The crowd moved on again. Nesvitski realized that it was a cannon ball.

"Hey, Cossack, my horse!" he said. "Now, then, you there! get out of the way! Make way!"

With great difficulty he managed to get to his horse, and shouting continually he moved on. The soldiers squeezed themselves to make way for him, but again pressed on him so that they jammed his leg, and those nearest him were not to blame for they were themselves pressed still harder from behind.

"Nesvitski, Nesvitski! you numskull!" came a hoarse voice from behind him.

Nesvitski looked round and saw, some fifteen paces away but separated by the living mass of moving infantry, Vaska Denisov, red and shaggy, with his cap on the back of his black head and a cloak hanging jauntily over his shoulder.

"Tell these devils, these fiends, to let me pass!" shouted Denisov evidently in a fit of rage, his coal-black eyes with their bloodshot whites glittering and rolling as he waved his sheathed saber in a small bare hand as red as his face.

"Ah, Vaska!" joyfully replied Nesvitski. "What's up with you?"

"The squadwon can't pass," shouted Vaska Denisov, showing his white teeth fiercely and spurring his black thoroughbred Arab, which twitched its ears as the bayonets touched it, and snorted, spurting white foam from his bit, tramping the planks of the bridge with his hoofs, and apparently ready to jump over the railings had his rider let him. "What is this? They're like sheep! Just like sheep! Out of the way!... Let us pass!... Stop there, you devil with the cart! I'll hack you with my saber!" he shouted, actually drawing his saber from its scabbard and flourishing it.

The soldiers crowded against one another with terrified faces, and Denisov joined Nesvitski.

"How's it you're not drunk today?" said Nesvitski when the other had ridden up to him.

"They don't even give one time to dwink!" answered Vaska Denisov. "They keep dwagging the wegitment to and fro all day. If they mean to fight, let's fight. But the devil knows what this is."

"What a dandy you are today!" said Nesvitski, looking at Denisov's new cloak and saddlecloth.

Denisov smiled, took out of his sabretache a handkerchief that diffused a smell of perfume, and put it to Nesvitski's nose.

"Of course, I'm going into action! I've shaved, bwushed my teeth, and scented myself."

The imposing figure of Nesvitski followed by his Cossack, and the determination of Denisov who flourished his sword and shouted frantically, had such an effect that they managed to squeeze through to the farther side of the bridge and stopped the infantry. Beside the bridge Nesvitski found the colonel to whom he had to deliver the order, and having done this he rode back.

Having cleared the way Denisov stopped at the end of the bridge. Carelessly holding in his stallion that was neighing and pawing the ground, eager to rejoin its fellows, he watched his squadron draw nearer. Then the clang of hoofs, as of several horses galloping, resounded on the planks of the bridge, and the squadron, officers in front and men four abreast, spread across the bridge and began to emerge on his side of it.

The infantry who had been stopped crowded near the bridge in the trampled mud and gazed with that particular feeling of ill-will, estrangement, and ridicule with which troops of different arms usually encounter one another at the clean, smart hussars who moved past them in regular order.

"Smart lads! Only fit for a fair!" said one.

"What good are they? They're led about just for show!" remarked another.

"Don't kick up the dust, you infantry!" jested an hussar whose prancing horse had splashed mud over some foot soldiers.

"I'd like to put you on a two days' march with a knapsack! Your fine cords would soon get a bit rubbed," said an infantryman, wiping the mud off his face with his sleeve. "Perched up there, you're more like a bird than a man."

"There now, Zikin, they ought to put you on a horse. You'd look fine," said a corporal, chaffing a thin little soldier who bent under the weight of his knapsack.

"Take a stick between your legs, that'll suit you for a horse!" the hussar shouted back.

CHAPTER VIII

The last of the infantry hurriedly crossed the bridge, squeezing together as they approached it as if passing through a funnel. At last the baggage wagons had all crossed, the crush was less, and the last battalion came onto the bridge. Only Denisov's squadron of hussars remained on the farther side of the bridge facing the enemy, who could be seen from the hill on the opposite bank but was not yet visible from the bridge, for the horizon as seen from the valley through which the river flowed was formed by the rising ground only half a mile away. At the foot of the hill lay wasteland over which a few groups of our Cossack scouts were moving. Suddenly on the road at the top of the high ground, artillery and troops in blue uniform were seen. These were the French. A group of Cossack scouts retired down the hill at a trot. All the officers and men of Denisov's squadron, though they tried to talk of other things and to look in other directions, thought only of what was there on the hilltop, and kept constantly looking at the patches appearing on the skyline, which they knew to be the enemy's troops. The weather had cleared again since noon and the sun was descending brightly upon the Danube and the dark hills around it. It was calm, and at intervals the bugle calls and the shouts of the enemy could be heard from the hill. There was no one now between the squadron and the enemy except a few scattered skirmishers. An empty space of some seven hundred yards was all that separated them. The enemy ceased firing, and that stern, threatening, inaccessible, and intangible line which separates two hostile armies was all the more clearly felt.

"One step beyond that boundary line which resembles the line dividing the living from the dead lies uncertainty, suffering, and

death. And what is there? Who is there?--there beyond that field, that tree, that roof lit up by the sun? No one knows, but one wants to know. You fear and yet long to cross that line, and know that sooner or later it must be crossed and you will have to find out what is there, just as you will inevitably have to learn what lies the other side of death. But you are strong, healthy, cheerful, and excited, and are surrounded by other such excitedly animated and healthy men." So thinks, or at any rate feels, anyone who comes in sight of the enemy, and that feeling gives a particular glamour and glad keenness of impression to everything that takes place at such moments.

On the high ground where the enemy was, the smoke of a cannon rose, and a ball flew whistling over the heads of the hussar squadron. The officers who had been standing together rode off to their places. The hussars began carefully aligning their horses. Silence fell on the whole squadron. All were looking at the enemy in front and at the squadron commander, awaiting the word of command. A second and a third cannon ball flew past. Evidently they were firing at the hussars, but the balls with rapid rhythmic whistle flew over the heads of the horsemen and fell somewhere beyond them. The hussars did not look round, but at the sound of each shot, as at the word of command, the whole squadron with its rows of faces so alike yet so different, holding its breath while the ball flew past, rose in the stirrups and sank back again. The soldiers without turning their heads glanced at one another, curious to see their comrades' impression. Every face, from Denisov's to that of the bugler, showed one common expression of conflict, irritation, and excitement, around chin and mouth. The quartermaster frowned, looking at the soldiers as if threatening to punish them. Cadet Mironov ducked every time a ball flew past. Rostov on the left flank, mounted on his Rook--a handsome horse despite its game leg--had the happy air of a schoolboy called up before a large audience for an examination in which he feels sure he will distinguish himself. He was glancing at everyone with a clear, bright expression, as if asking them to notice how calmly he sat under fire. But despite himself, on his face too that same indication of something new and stern showed round the mouth.

"Who's that curtseying there? Cadet Miwonov! That's not wight! Look at me," cried Denisov who, unable to keep still on one spot, kept turning his horse in front of the squadron.

The black, hairy, snub-nosed face of Vaska Denisov, and his whole short sturdy figure with the sinewy hairy hand and stumpy fingers in which he held the hilt of his naked saber, looked just as it usually did, especially toward evening when he had emptied his second bottle; he was only redder than usual. With his shaggy head thrown back like birds when they drink, pressing his spurs mercilessly into the sides of his good horse, Bedouin, and sitting as though falling backwards in the saddle, he galloped to the other flank of the squadron and shouted in a hoarse voice to the men to look to their pistols. He rode up to Kirsten. The staff captain on his broad-backed, steady mare came at a walk to meet him. His face with its long mustache was serious as always, only his eyes were brighter than usual.

"Well, what about it?" said he to Denisov. "It won't come to a fight. You'll see--we shall retire."

"The devil only knows what they're about!" muttered Denisov. "Ah, Wostov," he cried noticing the cadet's bright face, "you've got it at last."

And he smiled approvingly, evidently pleased with the cadet. Rostov felt perfectly happy. Just then the commander appeared on the bridge. Denisov galloped up to him.

"Your excellency! Let us attack them! I'll dwive them off."

"Attack indeed!" said the colonel in a bored voice, puckering up his face as if driving off a troublesome fly. "And why are you stopping

here? Don't you see the skirmishers are retreating? Lead the squadron back."

The squadron crossed the bridge and drew out of range of fire without having lost a single man. The second squadron that had been in the front line followed them across and the last Cossacks quitted the farther side of the river.

The two Pavlograd squadrons, having crossed the bridge, retired up the hill one after the other. Their colonel, Karl Bogdanich Schubert, came up to Denisov's squadron and rode at a footpace not far from Rostov, without taking any notice of him although they were now meeting for the first time since their encounter concerning Telyanin. Rostov, feeling that he was at the front and in the power of a man toward whom he now admitted that he had been to blame, did not lift his eyes from the colonel's athletic back, his nape covered with light hair, and his red neck. It seemed to Rostov that Bogdanich was only pretending not to notice him, and that his whole aim now was to test the cadet's courage, so he drew himself up and looked around him merrily; then it seemed to him that Bogdanich rode so near in order to show him his courage. Next he thought that his enemy would send the squadron on a desperate attack just to punish him--Rostov. Then he imagined how, after the attack, Bogdanich would come up to him as he lay wounded and would magnanimously extend the hand of reconciliation.

The high-shouldered figure of Zherkov, familiar to the Pavlograds as he had but recently left their regiment, rode up to the colonel. After his dismissal from headquarters Zherkov had not remained in the regiment, saying he was not such a fool as to slave at the front when he could get more rewards by doing nothing on the staff, and had succeeded in attaching himself as an orderly officer to Prince Bagration. He now came to his former chief with an order from the commander of the rear guard.

"Colonel," he said, addressing Rostov's enemy with an air of gloomy gravity and glancing round at his comrades, "there is an order to stop and fire the bridge."

"An order to who?" asked the colonel morosely.

"I don't myself know 'to who,'" replied the cornet in a serious tone, "but the prince told me to 'go and tell the colonel that the hussars must return quickly and fire the bridge.'"

Zherkov was followed by an officer of the suite who rode up to the colonel of hussars with the same order. After him the stout Nesvitski came galloping up on a Cossack horse that could scarcely carry his weight.

"How's this, Colonel?" he shouted as he approached. "I told you to fire the bridge, and now someone has gone and blundered; they are all beside themselves over there and one can't make anything out."

The colonel deliberately stopped the regiment and turned to Nesvitski.

"You spoke to me of inflammable material," said he, "but you said nothing about firing it."

"But, my dear sir," said Nesvitski as he drew up, taking off his cap and smoothing his hair wet with perspiration with his plump hand, "wasn't I telling you to fire the bridge, when inflammable material had been put in position?"

"I am not your 'dear sir,' Mr. Staff Officer, and you did not tell me to burn the bridge! I know the service, and it is my habit orders strictly to obey. You said the bridge would be burned, but who would it burn, I could not know by the holy spirit!"

"Ah, that's always the way!" said Nesvitski with a wave of the hand.
"How did you get here?" said he, turning to Zherkov.

"On the same business. But you are damp! Let me wring you out!"

"You were saying, Mr. Staff Officer..." continued the colonel in an offended tone.

"Colonel," interrupted the officer of the suite, "You must be quick or the enemy will bring up his guns to use grapeshot."

The colonel looked silently at the officer of the suite, at the stout staff officer, and at Zherkov, and he frowned.

"I will the bridge fire," he said in a solemn tone as if to announce that in spite of all the unpleasantness he had to endure he would still do the right thing.

Striking his horse with his long muscular legs as if it were to blame for everything, the colonel moved forward and ordered the second squadron, that in which Rostov was serving under Denisov, to return to the bridge.

"There, it's just as I thought," said Rostov to himself. "He wishes to test me!" His heart contracted and the blood rushed to his face. "Let him see whether I am a coward!" he thought.

Again on all the bright faces of the squadron the serious expression appeared that they had worn when under fire. Rostov watched his enemy, the colonel, closely--to find in his face confirmation of his own conjecture, but the colonel did not once glance at Rostov, and looked as he always did when at the front, solemn and stern. Then came the word of command.

"Look sharp! Look sharp!" several voices repeated around him.

Their sabers catching in the bridles and their spurs jingling, the hussars hastily dismounted, not knowing what they were to do. The men were crossing themselves. Rostov no longer looked at the colonel, he had no time. He was afraid of falling behind the hussars, so much afraid that his heart stood still. His hand trembled as he gave his horse into an orderly's charge, and he felt the blood rush to his heart with a thud. Denisov rode past him, leaning back and shouting something. Rostov saw nothing but the hussars running all around him, their spurs catching and their sabers clattering.

"Stretchers!" shouted someone behind him.

Rostov did not think what this call for stretchers meant; he ran on, trying only to be ahead of the others; but just at the bridge, not looking at the ground, he came on some sticky, trodden mud, stumbled, and fell on his hands. The others outstripped him.

"At boss zides, Captain," he heard the voice of the colonel, who, having ridden ahead, had pulled up his horse near the bridge, with a triumphant, cheerful face.

Rostov wiping his muddy hands on his breeches looked at his enemy and was about to run on, thinking that the farther he went to the front the better. But Bogdanich, without looking at or recognizing Rostov, shouted to him:

"Who's that running on the middle of the bridge? To the right! Come back, Cadet!" he cried angrily; and turning to Denisov, who, showing off his courage, had ridden on to the planks of the bridge:

"Why run risks, Captain? You should dismount," he said.

"Oh, every bullet has its billet," answered Vaska Denisov, turning

in his saddle.

Meanwhile Nesvitski, Zherkov, and the officer of the suite were standing together out of range of the shots, watching, now the small group of men with yellow shakos, dark-green jackets braided with cord, and blue riding breeches, who were swarming near the bridge, and then at what was approaching in the distance from the opposite side--the blue uniforms and groups with horses, easily recognizable as artillery.

"Will they burn the bridge or not? Who'll get there first? Will they get there and fire the bridge or will the French get within grapeshot range and wipe them out?" These were the questions each man of the troops on the high ground above the bridge involuntarily asked himself with a sinking heart--watching the bridge and the hussars in the bright evening light and the blue tunics advancing from the other side with their bayonets and guns.

"Ugh. The hussars will get it hot!" said Nesvitski; "they are within grapeshot range now."

"He shouldn't have taken so many men," said the officer of the suite.

"True enough," answered Nesvitski; "two smart fellows could have done the job just as well."

"Ah, your excellency," put in Zherkov, his eyes fixed on the hussars, but still with that naive air that made it impossible to know whether he was speaking in jest or in earnest. "Ah, your excellency! How you look at things! Send two men? And who then would give us the Vladimir medal and ribbon? But now, even if they do get peppered, the squadron may be recommended for honors and he may get a ribbon. Our Bogdanich knows how things are done."

"There now!" said the officer of the suite, "that's grapeshot."

He pointed to the French guns, the limbers of which were being detached and hurriedly removed.

On the French side, amid the groups with cannon, a cloud of smoke appeared, then a second and a third almost simultaneously, and at the moment when the first report was heard a fourth was seen. Then two reports one after another, and a third.

"Oh! Oh!" groaned Nesvitski as if in fierce pain, seizing the officer of the suite by the arm. "Look! A man has fallen! Fallen, fallen!"

"Two, I think."

"If I were Tsar I would never go to war," said Nesvitski, turning away.

The French guns were hastily reloaded. The infantry in their blue uniforms advanced toward the bridge at a run. Smoke appeared again but at irregular intervals, and grapeshot cracked and rattled onto the bridge. But this time Nesvitski could not see what was happening there, as a dense cloud of smoke arose from it. The hussars had succeeded in setting it on fire and the French batteries were now firing at them, no longer to hinder them but because the guns were trained and there was someone to fire at.

The French had time to fire three rounds of grapeshot before the hussars got back to their horses. Two were misdirected and the shot went too high, but the last round fell in the midst of a group of hussars and knocked three of them over.

Rostov, absorbed by his relations with Bogdanich, had paused on

the bridge not knowing what to do. There was no one to hew down (as he had always imagined battles to himself), nor could he help to fire the bridge because he had not brought any burning straw with him like the other soldiers. He stood looking about him, when suddenly he heard a rattle on the bridge as if nuts were being spilt, and the hussar nearest to him fell against the rails with a groan. Rostov ran up to him with the others. Again someone shouted, "Stretchers!" Four men seized the hussar and began lifting him.

"Oooh! For Christ's sake let me alone!" cried the wounded man, but still he was lifted and laid on the stretcher.

Nicholas Rostov turned away and, as if searching for something, gazed into the distance, at the waters of the Danube, at the sky, and at the sun. How beautiful the sky looked; how blue, how calm, and how deep! How bright and glorious was the setting sun! With what soft glitter the waters of the distant Danube shone. And fairer still were the faraway blue mountains beyond the river, the nunnery, the mysterious gorges, and the pine forests veiled in the mist of their summits... There was peace and happiness... "I should wishing for nothing else, nothing, if only I were there," thought Rostov. "In myself alone and in that sunshine there is so much happiness; but here... groans, suffering, fear, and this uncertainty and hurry... There--they are shouting again, and again are all running back somewhere, and I shall run with them, and it, death, is here above me and around... Another instant and I shall never again see the sun, this water, that gorge!..."

At that instant the sun began to hide behind the clouds, and other stretchers came into view before Rostov. And the fear of death and of the stretchers, and love of the sun and of life, all merged into one feeling of sickening agitation.

"O Lord God! Thou who art in that heaven, save, forgive, and protect me!" Rostov whispered.

The hussars ran back to the men who held their horses; their voices sounded louder and calmer, the stretchers disappeared from sight.

"Well, fwiend? So you've smelt powdah!" shouted Vaska Denisov just above his ear.

"It's all over; but I am a coward--yes, a coward!" thought Rostov, and sighing deeply he took Rook, his horse, which stood resting one foot, from the orderly and began to mount.

"Was that grapeshot?" he asked Denisov.

"Yes and no mistake!" cried Denisov. "You worked like wingular bwicks and it's nasty work! An attack's pleasant work! Hacking away at the dogs! But this sort of thing is the very devil, with them shooting at you like a target."

And Denisov rode up to a group that had stopped near Rostov, composed of the colonel, Nesvitski, Zherkov, and the officer from the suite.

"Well, it seems that no one has noticed," thought Rostov. And this was true. No one had taken any notice, for everyone knew the sensation which the cadet under fire for the first time had experienced.

"Here's something for you to report," said Zherkov. "See if I don't get promoted to a sublieutenancy."

"Inform the prince that I the bridge fired!" said the colonel triumphantly and gaily.

"And if he asks about the losses?"

"A trifle," said the colonel in his bass voice: "two hussars wounded, and one knocked out," he added, unable to restrain a happy smile, and pronouncing the phrase "knocked out" with ringing distinctness.

CHAPTER IX

Pursued by the French army of a hundred thousand men under the command of Bonaparte, encountering a population that was unfriendly to it, losing confidence in its allies, suffering from shortness of supplies, and compelled to act under conditions of war unlike anything that had been foreseen, the Russian army of thirty-five thousand men commanded by Kutuzov was hurriedly retreating along the Danube, stopping where overtaken by the enemy and fighting rearguard actions only as far as necessary to enable it to retreat without losing its heavy equipment. There had been actions at Lambach, Amstetten, and Melk; but despite the courage and endurance--acknowledged even by the enemy--with which the Russians fought, the only consequence of these actions was a yet more rapid retreat. Austrian troops that had escaped capture at Ulm and had joined Kutuzov at Braunau now separated from the Russian army, and Kutuzov was left with only his own weak and exhausted forces. The defense of Vienna was no longer to be thought of. Instead of an offensive, the plan of which, carefully prepared in accord with the modern science of strategics, had been handed to Kutuzov when he was in Vienna by the Austrian Hofkriegsrath, the sole and almost unattainable aim remaining for him was to effect a junction with the forces that were advancing from Russia, without losing his army as Mack had done at Ulm.

On the twenty-eighth of October Kutuzov with his army crossed to the left bank of the Danube and took up a position for the first time with the river between himself and the main body of the French. On the thirtieth he attacked Mortier's division, which was on the left bank, and broke it up. In this action for the first time trophies were taken: banners, cannon, and two enemy generals. For the first time, after a fortnight's retreat, the Russian troops had halted and after a fight had not only held the field but had repulsed the French. Though the troops were ill-clad, exhausted, and had lost a third of their number in killed, wounded, sick, and stragglers; though a number of sick and wounded had been abandoned on the other side of the Danube with a letter in which Kutuzov entrusted them to the humanity of the enemy; and though the big hospitals and the houses in Krems converted into military hospitals could no longer accommodate all the sick and wounded, yet the stand made at Krems and the victory over Mortier raised the spirits of the army considerably. Throughout the whole army and at headquarters most joyful though erroneous rumors were rife of the imaginary approach of columns from Russia, of some victory gained by the Austrians, and of the retreat of the frightened Bonaparte.

Prince Andrew during the battle had been in attendance on the Austrian General Schmidt, who was killed in the action. His horse had been wounded under him and his own arm slightly grazed by a bullet. As a mark of the commander in chief's special favor he was sent with the news of this victory to the Austrian court, now no longer at Vienna (which was threatened by the French) but at Brunn. Despite his apparently delicate build Prince Andrew could endure physical fatigue far better than many very muscular men, and on the night of the battle, having arrived at Krems excited but not weary, with dispatches from Dokhturov to Kutuzov, he was sent immediately with a special dispatch to Brunn. To be so sent meant not only a reward but an important step toward promotion.

The night was dark but starry, the road showed black in the snow that had fallen the previous day--the day of the battle. Reviewing his

impressions of the recent battle, picturing pleasantly to himself the impression his news of a victory would create, or recalling the send-off given him by the commander in chief and his fellow officers, Prince Andrew was galloping along in a post chaise enjoying the feelings of a man who has at length begun to attain a long-desired happiness. As soon as he closed his eyes his ears seemed filled with the rattle of the wheels and the sensation of victory. Then he began to imagine that the Russians were running away and that he himself was killed, but he quickly roused himself with a feeling of joy, as if learning afresh that this was not so but that on the contrary the French had run away. He again recalled all the details of the victory and his own calm courage during the battle, and feeling reassured he dozed off.... The dark starry night was followed by a bright cheerful morning. The snow was thawing in the sunshine, the horses galloped quickly, and on both sides of the road were forests of different kinds, fields, and villages.

At one of the post stations he overtook a convoy of Russian wounded. The Russian officer in charge of the transport lolled back in the front cart, shouting and scolding a soldier with coarse abuse. In each of the long German carts six or more pale, dirty, bandaged men were being jolted over the stony road. Some of them were talking (he heard Russian words), others were eating bread; the more severely wounded looked silently, with the languid interest of sick children, at the envoy hurrying past them.

Prince Andrew told his driver to stop, and asked a soldier in what action they had been wounded. "Day before yesterday, on the Danube," answered the soldier. Prince Andrew took out his purse and gave the soldier three gold pieces.

"That's for them all," he said to the officer who came up.

"Get well soon, lads!" he continued, turning to the soldiers.
"There's plenty to do still."

"What news, sir?" asked the officer, evidently anxious to start a conversation.

"Good news!... Go on!" he shouted to the driver, and they galloped on.

It was already quite dark when Prince Andrew rattled over the paved streets of Brunn and found himself surrounded by high buildings, the lights of shops, houses, and street lamps, fine carriages, and all that atmosphere of a large and active town which is always so attractive to a soldier after camp life. Despite his rapid journey and sleepless night, Prince Andrew when he drove up to the palace felt even more vigorous and alert than he had done the day before. Only his eyes gleamed feverishly and his thoughts followed one another with extraordinary clearness and rapidity. He again vividly recalled the details of the battle, no longer dim, but definite and in the concise form in which he imagined himself stating them to the Emperor Francis. He vividly imagined the casual questions that might be put to him and the answers he would give. He expected to be at once presented to the Emperor. At the chief entrance to the palace, however, an official came running out to meet him, and learning that he was a special messenger led him to another entrance.

"To the right from the corridor, Euer Hochgeboren! There you will find the adjutant on duty," said the official. "He will conduct you to the Minister of War."

The adjutant on duty, meeting Prince Andrew, asked him to wait, and went in to the Minister of War. Five minutes later he returned and bowing with particular courtesy ushered Prince Andrew before him along a corridor to the cabinet where the Minister of War was at work. The adjutant by his elaborate courtesy appeared to wish to ward off any attempt at familiarity on the part of the Russian messenger.

Prince Andrew's joyous feeling was considerably weakened as he approached the door of the minister's room. He felt offended, and without his noticing it the feeling of offense immediately turned into one of disdain which was quite uncalled for. His fertile mind instantly suggested to him a point of view which gave him a right to despise the adjutant and the minister. "Away from the smell of powder, they probably think it easy to gain victories!" he thought. His eyes narrowed disdainfully, he entered the room of the Minister of War with peculiarly deliberate steps. This feeling of disdain was heightened when he saw the minister seated at a large table reading some papers and making pencil notes on them, and for the first two or three minutes taking no notice of his arrival. A wax candle stood at each side of the minister's bent bald head with its gray temples. He went on reading to the end, without raising his eyes at the opening of the door and the sound of footsteps.

"Take this and deliver it," said he to his adjutant, handing him the papers and still taking no notice of the special messenger.

Prince Andrew felt that either the actions of Kutuzov's army interested the Minister of War less than any of the other matters he was concerned with, or he wanted to give the Russian special messenger that impression. "But that is a matter of perfect indifference to me," he thought. The minister drew the remaining papers together, arranged them evenly, and then raised his head. He had an intellectual and distinctive head, but the instant he turned to Prince Andrew the firm, intelligent expression on his face changed in a way evidently deliberate and habitual to him. His face took on the stupid artificial smile (which does not even attempt to hide its artificiality) of a man who is continually receiving many petitioners one after another.

"From General Field Marshal Kutuzov?" he asked. "I hope it is good news? There has been an encounter with Mortier? A victory? It was high time!"

He took the dispatch which was addressed to him and began to read it with a mournful expression.

"Oh, my God! My God! Schmidt!" he exclaimed in German. "What a calamity! What a calamity!"

Having glanced through the dispatch he laid it on the table and looked at Prince Andrew, evidently considering something.

"Ah what a calamity! You say the affair was decisive? But Mortier is not captured." Again he pondered. "I am very glad you have brought good news, though Schmidt's death is a heavy price to pay for the victory. His Majesty will no doubt wish to see you, but not today. I thank you! You must have a rest. Be at the levee tomorrow after the parade. However, I will let you know."

The stupid smile, which had left his face while he was speaking, reappeared.

"Au revoir! Thank you very much. His Majesty will probably desire to see you," he added, bowing his head.

When Prince Andrew left the palace he felt that all the interest and happiness the victory had afforded him had been now left in the indifferent hands of the Minister of War and the polite adjutant. The whole tenor of his thoughts instantaneously changed; the battle seemed the memory of a remote event long past.

CHAPTER X

Prince Andrew stayed at Brunn with Bilibin, a Russian acquaintance of his in the diplomatic service.

"Ah, my dear prince! I could not have a more welcome visitor," said Bilibin as he came out to meet Prince Andrew. "Franz, put the prince's things in my bedroom," said he to the servant who was ushering Bolkonski in. "So you're a messenger of victory, eh? Splendid! And I am sitting here ill, as you see."

After washing and dressing, Prince Andrew came into the diplomat's luxurious study and sat down to the dinner prepared for him. Bilibin settled down comfortably beside the fire.

After his journey and the campaign during which he had been deprived of all the comforts of cleanliness and all the refinements of life, Prince Andrew felt a pleasant sense of repose among luxurious surroundings such as he had been accustomed to from childhood. Besides it was pleasant, after his reception by the Austrians, to speak if not in Russian (for they were speaking French) at least with a Russian who would, he supposed, share the general Russian antipathy to the Austrians which was then particularly strong.

Bilibin was a man of thirty-five, a bachelor, and of the same circle as Prince Andrew. They had known each other previously in Petersburg, but had become more intimate when Prince Andrew was in Vienna with Kutuzov. Just as Prince Andrew was a young man who gave promise of rising high in the military profession, so to an even greater extent Bilibin gave promise of rising in his diplomatic career. He still a young man but no longer a young diplomat, as he had entered the service at the age of sixteen, had been in Paris and Copenhagen, and now held a rather important post in Vienna. Both the foreign minister and our ambassador in Vienna knew him and valued him. He was not one of those many diplomats who are esteemed because they have certain negative qualities, avoid doing certain things, and speak French. He was one of those, who, liking work, knew how to do it, and despite his indolence would sometimes spend a whole night at his writing table. He worked well whatever the import of his work. It was not the question "What for?" but the question "How?" that interested him. What the diplomatic matter might be he did not care, but it gave him great pleasure to prepare a circular, memorandum, or report, skillfully, pointedly, and elegantly. Bilibin's services were valued not only for what he wrote, but also for his skill in dealing and conversing with those in the highest spheres.

Bilibin liked conversation as he liked work, only when it could be made elegantly witty. In society he always awaited an opportunity to say something striking and took part in a conversation only when that was possible. His conversation was always sprinkled with wittily original, finished phrases of general interest. These sayings were prepared in the inner laboratory of his mind in a portable form as if intentionally, so that insignificant society people might carry them from drawing room to drawing room. And, in fact, Bilibin's witticisms were hawked about in the Viennese drawing rooms and often had an influence on matters considered important.

His thin, worn, sallow face was covered with deep wrinkles, which always looked as clean and well washed as the tips of one's fingers after a Russian bath. The movement of these wrinkles formed the principal play of expression on his face. Now his forehead would pucker into deep folds and his eyebrows were lifted, then his eyebrows would descend and deep wrinkles would crease his cheeks. His small, deep-set eyes always twinkled and looked out straight.

"Well, now tell me about your exploits," said he.

Bolkonski, very modestly without once mentioning himself, described the engagement and his reception by the Minister of War.

"They received me and my news as one receives a dog in a game of skittles," said he in conclusion.

Bilibin smiled and the wrinkles on his face disappeared.

"Cependant, mon cher," he remarked, examining his nails from a distance and puckering the skin above his left eye, "malgre la haute estime que je professe pour the Orthodox Russian army, j'avoue que votre victoire n'est pas des plus victorieuses."*

*"But my dear fellow, with all my respect for the Orthodox Russian army, I must say that your victory was not particularly victorious."

He went on talking in this way in French, uttering only those words in Russian on which he wished to put a contemptuous emphasis.

"Come now! You with all your forces fall on the unfortunate Mortier and his one division, and even then Mortier slips through your fingers! Where's the victory?"

"But seriously," said Prince Andrew, "we can at any rate say without boasting that it was a little better than at Ulm..."

"Why didn't you capture one, just one, marshal for us?"

"Because not everything happens as one expects or with the smoothness of a parade. We had expected, as I told you, to get at their rear by seven in the morning but had not reached it by five in the afternoon."

"And why didn't you do it at seven in the morning? You ought to have been there at seven in the morning," returned Bilibin with a smile.
"You ought to have been there at seven in the morning."

"Why did you not succeed in impressing on Bonaparte by diplomatic methods that he had better leave Genoa alone?" retorted Prince Andrew in the same tone.

"I know," interrupted Bilibin, "you're thinking it's very easy to take marshals, sitting on a sofa by the fire! That is true, but still why didn't you capture him? So don't be surprised if not only the Minister of War but also his Most August Majesty the Emperor and King Francis is not much delighted by your victory. Even I, a poor secretary of the Russian Embassy, do not feel any need in token of my joy to give my Franz a thaler, or let him go with his Liebchen to the Prater... True, we have no Prater here..."

He looked straight at Prince Andrew and suddenly unwrinkled his forehead.

"It is now my turn to ask you 'why?' mon cher," said Bolkonski. "I confess I do not understand: perhaps there are diplomatic subtleties here beyond my feeble intelligence, but I can't make it out. Mack loses a whole army, the Archduke Ferdinand and the Archduke Karl give no signs of life and make blunder after blunder. Kutuzov alone at last gains a real victory, destroying the spell of the invincibility of the French, and the Minister of War does not even care to hear the details."

"That's just it, my dear fellow. You see it's hurrah for the Tsar, for Russia, for the Orthodox Greek faith! All that is beautiful, but what do we, I mean the Austrian court, care for your victories? Bring us nice news of a victory by the Archduke Karl or Ferdinand (one archduke's as good as another, as you know) and even if it is only over a fire brigade of Bonaparte's, that will be another story and we'll fire off some cannon! But this sort of thing seems done on purpose to vex us. The Archduke Karl does nothing, the Archduke Ferdinand disgraces himself. You abandon Vienna, give up its defense--as much as to say: 'Heaven is with us, but heaven help you and your capital!' The one general whom we all loved, Schmidt, you

expose to a bullet, and then you congratulate us on the victory! Admit that more irritating news than yours could not have been conceived. It's as if it had been done on purpose, on purpose. Besides, suppose you did gain a brilliant victory, if even the Archduke Karl gained a victory, what effect would that have on the general course of events? It's too late now when Vienna is occupied by the French army!"

"What? Occupied? Vienna occupied?"

"Not only occupied, but Bonaparte is at Schonbrunn, and the count, our dear Count Vrbna, goes to him for orders."

After the fatigues and impressions of the journey, his reception, and especially after having dined, Bolkonski felt that he could not take in the full significance of the words he heard.

"Count Lichtenfels was here this morning," Bilibin continued, "and showed me a letter in which the parade of the French in Vienna was fully described: Prince Murat et tout le tremblement... You see that your victory is not a matter for great rejoicing and that you can't be received as a savior."

"Really I don't care about that, I don't care at all," said Prince Andrew, beginning to understand that his news of the battle before Krems was really of small importance in view of such events as the fall of Austria's capital. "How is it Vienna was taken? What of the bridge and its celebrated bridgehead and Prince Auersperg? We heard reports that Prince Auersperg was defending Vienna?" he said.

"Prince Auersperg is on this, on our side of the river, and is defending us--doing it very badly, I think, but still he is defending us. But Vienna is on the other side. No, the bridge has not yet been taken and I hope it will not be, for it is mined and orders have been given to blow it up. Otherwise we should long ago have been in the mountains of Bohemia, and you and your army would have spent a bad quarter of an hour between two fires."

"But still this does not mean that the campaign is over," said Prince Andrew.

"Well, I think it is. The bigwigs here think so too, but they daren't say so. It will be as I said at the beginning of the campaign, it won't be your skirmishing at Durrenstein, or gunpowder at all, that will decide the matter, but those who devised it," said Bilibin quoting one of his own mots, releasing the wrinkles on his forehead, and pausing. "The only question is what will come of the meeting between the Emperor Alexander and the King of Prussia in Berlin? If Prussia joins the Allies, Austria's hand will be forced and there will be war. If not it is merely a question of settling where the preliminaries of the new Campo Formio are to be drawn up."

"What an extraordinary genius!" Prince Andrew suddenly exclaimed, clenching his small hand and striking the table with it, "and what luck the man has!"

"Buonaparte?" said Bilibin inquiringly, puckering up his forehead to indicate that he was about to say something witty. "Buonaparte?" he repeated, accentuating the u: "I think, however, now that he lays down laws for Austria at Schonbrunn, il faut lui faire grace de l'u!* I shall certainly adopt an innovation and call him simply Bonaparte!"

*"We must let him off the u!"

"But joking apart," said Prince Andrew, "do you really think the campaign is over?"

"This is what I think. Austria has been made a fool of, and she is not used to it. She will retaliate. And she has been fooled in the

first place because her provinces have been pillaged--they say the Holy Russian army loots terribly--her army is destroyed, her capital taken, and all this for the beaux yeux* of His Sardinian Majesty. And therefore--this is between ourselves--I instinctively feel that we are being deceived, my instinct tells me of negotiations with France and projects for peace, a secret peace concluded separately."

*Fine eyes.

"Impossible!" cried Prince Andrew. "That would be too base."

"If we live we shall see," replied Bilibin, his face again becoming smooth as a sign that the conversation was at an end.

When Prince Andrew reached the room prepared for him and lay down in a clean shirt on the feather bed with its warmed and fragrant pillows, he felt that the battle of which he had brought tidings was far, far away from him. The alliance with Prussia, Austria's treachery, Bonaparte's new triumph, tomorrow's levee and parade, and the audience with the Emperor Francis occupied his thoughts.

He closed his eyes, and immediately a sound of cannonading, of musketry and the rattling of carriage wheels seemed to fill his ears, and now again drawn out in a thin line the musketeers were descending the hill, the French were firing, and he felt his heart palpitating as he rode forward beside Schmidt with the bullets merrily whistling all around, and he experienced tenfold the joy of living, as he had not done since childhood.

He woke up...

"Yes, that all happened!" he said, and, smiling happily to himself like a child, he fell into a deep, youthful slumber.

CHAPTER XI

Next day he woke late. Recalling his recent impressions, the first thought that came into his mind was that today he had to be presented to the Emperor Francis; he remembered the Minister of War, the polite Austrian adjutant, Bilibin, and last night's conversation. Having dressed for his attendance at court in full parade uniform, which he had not worn for a long time, he went into Bilibin's study fresh, animated, and handsome, with his hand bandaged. In the study were four gentlemen of the diplomatic corps. With Prince Hippolyte Kuragin, who was a secretary to the embassy, Bolkonski was already acquainted. Bilibin introduced him to the others.

The gentlemen assembled at Bilibin's were young, wealthy, gay society men, who here, as in Vienna, formed a special set which Bilibin, their leader, called les notres.* This set, consisting almost exclusively of diplomats, evidently had its own interests which had nothing to do with war or politics but related to high society, to certain women, and to the official side of the service. These gentlemen received Prince Andrew as one of themselves, an honor they did not extend to many. From politeness and to start conversation, they asked him a few questions about the army and the battle, and then the talk went off into merry jests and gossip.

*Ours.

"But the best of it was," said one, telling of the misfortune of a fellow diplomat, "that the Chancellor told him flatly that his appointment to London was a promotion and that he was so to regard it. Can you fancy the figure he cut?..."

"But the worst of it, gentlemen--I am giving Kuragin away to you--is that that man suffers, and this Don Juan, wicked fellow, is taking advantage of it!"

Prince Hippolyte was lolling in a lounge chair with his legs over its arm. He began to laugh.

"Tell me about that!" he said.

"Oh, you Don Juan! You serpent!" cried several voices.

"You, Bolkonski, don't know," said Bilibin turning to Prince Andrew, "that all the atrocities of the French army (I nearly said of the Russian army) are nothing compared to what this man has been doing among the women!"

"La femme est la compagne de l'homme,"* announced Prince Hippolyte, and began looking through a lorgnette at his elevated legs.

*"Woman is man's companion."

Bilibin and the rest of "ours" burst out laughing in Hippolyte's face, and Prince Andrew saw that Hippolyte, of whom--he had to admit--he had almost been jealous on his wife's account, was the butt of this set.

"Oh, I must give you a treat," Bilibin whispered to Bolkonski. "Kuragin is exquisite when he discusses politics--you should see his gravity!"

He sat down beside Hippolyte and wrinkling his forehead began talking to him about politics. Prince Andrew and the others gathered round these two.

"The Berlin cabinet cannot express a feeling of alliance," began Hippolyte gazing round with importance at the others, "without expressing... as in its last note... you understand... Besides, unless His Majesty the Emperor derogates from the principle of our alliance..."

"Wait, I have not finished..." he said to Prince Andrew, seizing him by the arm, "I believe that intervention will be stronger than nonintervention. And..." he paused. "Finally one cannot impute the nonreceipt of our dispatch of November 18. That is how it will end." And he released Bolkonski's arm to indicate that he had now quite finished.

"Demosthenes, I know thee by the pebble thou secretest in thy golden mouth!" said Bilibin, and the mop of hair on his head moved with satisfaction.

Everybody laughed, and Hippolyte louder than anyone. He was evidently distressed, and breathed painfully, but could not restrain the wild laughter that convulsed his usually impassive features.

"Well now, gentlemen," said Bilibin, "Bolkonski is my guest in this house and in Brunn itself. I want to entertain him as far as I can, with all the pleasures of life here. If we were in Vienna it would be easy, but here, in this wretched Moravian hole, it is more difficult, and I beg you all to help me. Brunn's attractions must be shown him. You can undertake the theater, I society, and you, Hippolyte, of course the women."

"We must let him see Amelie, she's exquisite!" said one of "ours," kissing his finger tips.

"In general we must turn this bloodthirsty soldier to more humane interests," said Bilibin.

"I shall scarcely be able to avail myself of your hospitality, gentlemen, it is already time for me to go," replied Prince Andrew looking at his watch.

"Where to?"

"To the Emperor."

"Oh! Oh! Oh! Well, au revoir, Bolkonski! Au revoir, Prince! Come back early to dinner," cried several voices. "We'll take you in hand."

"When speaking to the Emperor, try as far as you can to praise the way that provisions are supplied and the routes indicated," said Bilibin, accompanying him to the hall.

"I should like to speak well of them, but as far as I the facts, I can't," replied Bolkonski, smiling.

"Well, talk as much as you can, anyway. He has a passion for giving audiences, but he does not like talking himself and can't do it, as you will see."

CHAPTER XII

At the levee Prince Andrew stood among the Austrian officers as he had been told to, and the Emperor Francis merely looked fixedly into his face and just nodded to him with his long head. But after it was over, the adjutant he had seen the previous day ceremoniously informed Bolkonski that the Emperor desired to give him an audience. The Emperor Francis received him standing in the middle of the room. Before the conversation began Prince Andrew was struck by the fact that the Emperor seemed confused and blushed as if not knowing what to say.

"Tell me, when did the battle begin?" he asked hurriedly.

Prince Andrew replied. Then followed other questions just as simple: "Was Kutuzov well? When had he left Krems?" and so on. The Emperor spoke as if his sole aim were to put a given number of questions - the answers to these questions, as was only too evident, did not interest him.

"At what o'clock did the battle begin?" asked the Emperor.

"I cannot inform Your Majesty at what o'clock the battle began at the front, but at Durrenstein, where I was, our attack began after five in the afternoon," replied Bolkonski growing more animated and expecting that he would have a chance to give a reliable account, which he had ready in his mind, of all he knew and had seen. But the Emperor smiled and interrupted him.

"How many miles?"

"From where to where, Your Majesty?"

"From Durrenstein to Krems."

"Three and a half miles, Your Majesty."

"The French have abandoned the left bank?"

"According to the scouts the last of them crossed on rafts during the night."

"Is there sufficient forage in Krems?"

"Forage has not been supplied to the extent..."

The Emperor interrupted him.

"At what o'clock was General Schmidt killed?"

"At seven o'clock, I believe."

"At seven o'clock? It's very sad, very sad!"

The Emperor thanked Prince Andrew and bowed. Prince Andrew withdrew and was immediately surrounded by courtiers on all sides. Everywhere he saw friendly looks and heard friendly words. Yesterday's adjutant reproached him for not having stayed at the palace, and offered him his own house. The Minister of War came up and congratulated him on the Maria Theresa Order of the third grade, which the Emperor was conferring on him. The Empress' chamberlain invited him to see Her Majesty. The archduchess also wished to see him. He did not know whom to answer, and for a few seconds collected his thoughts. Then the Russian ambassador took him by the shoulder, led him to the window, and began to talk to him.

Contrary to Bilibin's forecast the news he had brought was joyfully received. A thanksgiving service was arranged, Kutuzov was awarded the Grand Cross of Maria Theresa, and the whole army received rewards. Bolkonski was invited everywhere, and had to spend the whole morning calling on the principal Austrian dignitaries. Between four and five in the afternoon, having made all his calls, he was returning to Bilibin's house thinking out a letter to his father about the battle and his visit to Brunn. At the door he found a vehicle half full of luggage. Franz, Bilibin's man, was dragging a portmanteau with some difficulty out of the front door.

Before returning to Bilibin's Prince Andrew had gone to bookshop to provide himself with some books for the campaign, and had spent some time in the shop.

"What is it?" he asked.

"Oh, your excellency!" said Franz, with difficulty rolling the portmanteau into the vehicle, "we are to move on still farther. The scoundrel is again at our heels!"

"Eh? What?" asked Prince Andrew.

Bilibin came out to meet him. His usually calm face showed excitement.

"There now! Confess that this is delightful," said he. "This affair of the Thabor Bridge, at Vienna.... They have crossed without striking a blow!"

Prince Andrew could not understand.

"But where do you come from not to know what every coachman in the town knows?"

"I come from the archduchess'. I heard nothing there."

"And you didn't see that everybody is packing up?"

"I did not... What is it all about?" inquired Prince Andrew impatiently.

"What's it all about? Why, the French have crossed the bridge that Auersperg was defending, and the bridge was not blown up: so Murat is now rushing along the road to Brunn and will be here in a day or two."

"What? Here? But why did they not blow up the bridge, if it was mined?"

"That is what I ask you. No one, not even Bonaparte, knows why."

Bolkonski shrugged his shoulders.

"But if the bridge is crossed it means that the army too is lost? It will be cut off," said he.

"That's just it," answered Bilibin. "Listen! The French entered Vienna as I told you. Very well. Next day, which was yesterday, those gentlemen, messieurs les marechaux,* Murat, Lannes, and Belliard, mount and ride to bridge. (Observe that all three are Gascons.) 'Gentlemen,' says one of them, 'you know the Thabor Bridge is mined and doubly mined and that there are menacing fortifications at its head and an army of fifteen thousand men has been ordered to blow up the bridge and not let us cross? But it will please our sovereign the Emperor Napoleon if we take this bridge, so let us three go and take it!' 'Yes, let's!' say the others. And off they go and take the bridge, cross it, and now with their whole army are on this side of the Danube, marching on us, you, and your lines of communication."

*The marshalls.

"Stop jesting," said Prince Andrew sadly and seriously. This news grieved him and yet he was pleased.

As soon as he learned that the Russian army was in such a hopeless situation it occurred to him that it was he who was destined to lead it out of this position; that here was the Toulon that would lift him from the ranks of obscure officers and offer him the first step to fame! Listening to Bilibin he was already imagining how on reaching the army he would give an opinion at the war council which would be the only one that could save the army, and how he alone would be entrusted with the executing of the plan.

"Stop this jesting," he said

"I am not jesting," Bilibin went on. "Nothing is truer or sadder. These gentlemen ride onto the bridge alone and wave white handkerchiefs; they assure the officer on duty that they, the marshals, are on their way to negotiate with Prince Auersperg. He lets them enter the tete-de-pont.* They spin him a thousand gasconades, saying that the war is over, that the Emperor Francis is arranging a meeting with Bonaparte, that they desire to see Prince Auersperg, and so on. The officer sends for Auersperg; these gentlemen embrace the officers, crack jokes, sit on the cannon, and meanwhile a French battalion gets to the bridge unobserved, flings the bags of incendiary material into the water, and approaches the tete-de-pont. At length appears the lieutenant general, our dear Prince Auersperg von Mautern himself. 'Dearest foe! Flower of the Austrian army, hero of the Turkish wars Hostilities are ended, we can shake one another's hand.... The Emperor Napoleon burns with impatience to make Prince Auersperg's acquaintance.' In a word, those gentlemen, Gascons indeed, so bewildered him with fine words, and he is so flattered by his rapidly established intimacy with the French marshals, and so dazzled by the sight of Murat's mantle and ostrich plumes, qu'il n'y voit que du feu, et oublie celui qu'il devait faire faire sur l'ennemi!"*[2] In spite of the animation of his speech, Bilibin did not forget to pause after this mot to give time for its due appreciation. "The French battalion rushes to the bridgehead, spikes

the guns, and the bridge is taken! But what is best of all," he went on, his excitement subsiding under the delightful interest of his own story, "is that the sergeant in charge of the cannon which was to give the signal to fire the mines and blow up the bridge, this sergeant, seeing that the French troops were running onto the bridge, was about to fire, but Lannes stayed his hand. The sergeant, who was evidently wiser than his general, goes up to Auersperg and says: 'Prince, you are being deceived, here are the French!' Murat, seeing that all is lost if the sergeant is allowed to speak, turns to Auersperg with feigned astonishment (he is a true Gascon) and says: 'I don't recognize the world-famous Austrian discipline, if you allow a subordinate to address you like that!' It was a stroke of genius. Prince Auersperg feels his dignity at stake and orders the sergeant to be arrested. Come, you must own that this affair of the Thabor Bridge is delightful! It is not exactly stupidity, nor rascality...."

*Bridgehead.

*[2] That their fire gets into his eyes and he forgets that he ought to be firing at the enemy.

"It may be treachery," said Prince Andrew, vividly imagining the gray overcoats, wounds, the smoke of gunpowder, the sounds of firing, and the glory that awaited him.

"Not that either. That puts the court in too bad a light," replied Bilibin. "It's not treachery nor rascality nor stupidity: it is just as at Ulm... it is..."--he seemed to be trying to find the right expression. "C'est... c'est du Mack. Nous sommes mackes [It is... it is a bit of Mack. We are Macked]," he concluded, feeling that he had produced a good epigram, a fresh one that would be repeated. His hitherto puckered brow became smooth as a sign of pleasure, and with a slight smile he began to examine his nails.

"Where are you off to?" he said suddenly to Prince Andrew who had risen and was going toward his room.

"I am going away."

"Where to?"

"To the army."

"But you meant to stay another two days?"

"But now I am off at once."

And Prince Andrew after giving directions about his departure went to his room.

"Do you know, mon cher," said Bilibin following him, "I have been thinking about you. Why are you going?"

And in proof of the conclusiveness of his opinion all the wrinkles vanished from his face.

Prince Andrew looked inquiringly at him and gave no reply.

"Why are you going? I know you think it your duty to gallop back to the army now that it is in danger. I understand that. Mon cher, it is heroism!"

"Not at all," said Prince Andrew.

"But as you are a philosopher, be a consistent one, look at the other side of the question and you will see that your duty, on the contrary, is to take care of yourself. Leave it to those who are no

longer fit for anything else.... You have not been ordered to return and have not been dismissed from here; therefore, you can stay and go with us wherever our ill luck takes us. They say we are going to Olmutz, and Olmutz is a very decent town. You and I will travel comfortably in my caleche."

"Do stop joking, Bilibin," cried Bolkonski.

"I am speaking sincerely as a friend! Consider! Where and why are you going, when you might remain here? You are faced by one of two things," and the skin over his left temple puckered, "either you will not reach your regiment before peace is concluded, or you will share defeat and disgrace with Kutuzov's whole army."

And Bilibin unwrinkled his temple, feeling that the dilemma was insoluble.

"I cannot argue about it," replied Prince Andrew coldly, but he thought: "I am going to save the army."

"My dear fellow, you are a hero!" said Bilibin.

CHAPTER XIII

That same night, having taken leave of the Minister of War, Bolkonski set off to rejoin the army, not knowing where he would find it and fearing to be captured by the French on the way to Krems.

In Brunn everybody attached to the court was packing up, and the heavy baggage was already being dispatched to Olmutz. Near Hetzeldorf Prince Andrew struck the high road along which the Russian army was moving with great haste and in the greatest disorder. The road was so obstructed with carts that it was impossible to get by in a carriage. Prince Andrew took a horse and a Cossack from a Cossack commander, and hungry and weary, making his way past the baggage wagons, rode in search of the commander in chief and of his own luggage. Very sinister reports of the position of the army reached him as he went along, and the appearance of the troops in their disorderly flight confirmed these rumors.

"Cette armee russe que l'or de l'Angleterre a transportee des extremites de l'univers, nous allons lui faire eprouver le meme sort--(le sort de l'armee d'Ulm)."^{*} He remembered these words in Bonaparte's address to his army at the beginning of the campaign, and they awoke in him astonishment at the genius of his hero, a feeling of wounded pride, and a hope of glory. "And should there be nothing left but to die?" he thought. "Well, if need be, I shall do it no worse than others."

*"That Russian army which has been brought from the ends of the earth by English gold, we shall cause to share the same fate--(the fate of the army at Ulm)."

He looked with disdain at the endless confused mass of detachments, carts, guns, artillery, and again baggage wagons and vehicles of all kinds overtaking one another and blocking the muddy road, three and sometimes four abreast. From all sides, behind and before, as far as ear could reach, there were the rattle of wheels, the creaking of carts and gun carriages, the tramp of horses, the crack of whips, shouts, the urging of horses, and the swearing of soldiers, orderlies, and officers. All along the sides of the road fallen horses were to be seen, some flayed, some not, and broken-down carts beside which solitary soldiers sat waiting for

something, and again soldiers straggling from their companies, crowds of whom set off to the neighboring villages, or returned from them dragging sheep, fowls, hay, and bulging sacks. At each ascent or descent of the road the crowds were yet denser and the din of shouting more incessant. Soldiers floundering knee-deep in mud pushed the guns and wagons themselves. Whips cracked, hoofs slipped, traces broke, and lungs were strained with shouting. The officers directing the march rode backward and forward between the carts. Their voices were but feebly heard amid the uproar and one saw by their faces that they despaired of the possibility of checking this disorder.

"Here is our dear Orthodox Russian army," thought Bolkonski, recalling Bilibin's words.

Wishing to find out where the commander in chief was, he rode up to a convoy. Directly opposite to him came a strange one-horse vehicle, evidently rigged up by soldiers out of any available materials and looking like something between a cart, a cabriolet, and a caleche. A soldier was driving, and a woman enveloped in shawls sat behind the apron under the leather hood of the vehicle. Prince Andrew rode up and was just putting his question to a soldier when his attention was diverted by the desperate shrieks of the woman in the vehicle. An officer in charge of transport was beating the soldier who was driving the woman's vehicle for trying to get ahead of others, and the strokes of his whip fell on the apron of the equipage. The woman screamed piercingly. Seeing Prince Andrew she leaned out from behind the apron and, waving her thin arms from under the woolen shawl, cried:

"Mr. Aide-de-camp! Mr. Aide-de-camp!... For heaven's sake... Protect me! What will become of us? I am the wife of the doctor of the Seventh Chasseurs.... They won't let us pass, we are left behind and have lost our people..."

"I'll flatten you into a pancake!" shouted the angry officer to the soldier. "Turn back with your slut!"

"Mr. Aide-de-camp! Help me!... What does it all mean?" screamed the doctor's wife.

"Kindly let this cart pass. Don't you see it's a woman?" said Prince Andrew riding up to the officer.

The officer glanced at him, and without replying turned again to the soldier. "I'll teach you to push on!... Back!"

"Let them pass, I tell you!" repeated Prince Andrew, compressing his lips.

"And who are you?" cried the officer, turning on him with tipsy rage, "who are you? Are you in command here? Eh? I am commander here, not you! Go back or I'll flatten you into a pancake," repeated he. This expression evidently pleased him.

"That was a nice snub for the little aide-de-camp," came a voice from behind.

Prince Andrew saw that the officer was in that state of senseless, tipsy rage when a man does not know what he is saying. He saw that his championship of the doctor's wife in her queer trap might expose him to what he dreaded more than anything in the world--to ridicule; but his instinct urged him on. Before the officer finished his sentence Prince Andrew, his face distorted with fury, rode up to him and raised his riding whip.

"Kind...ly let--them--pass!"

The officer flourished his arm and hastily rode away.

"It's all the fault of these fellows on the staff that there's this disorder," he muttered. "Do as you like."

Prince Andrew without lifting his eyes rode hastily away from the doctor's wife, who was calling him her deliverer, and recalling with a sense of disgust the minutest details of this humiliating scene he galloped on to the village where he was told that the commander in chief was.

On reaching the village he dismounted and went to the nearest house, intending to rest if but for a moment, eat something, and try to sort out the stinging and tormenting thoughts that confused his mind. "This is a mob of scoundrels and not an army," he was thinking as he went up to the window of the first house, when a familiar voice called him by name.

He turned round. Nesvitski's handsome face looked out of the little window. Nesvitski, moving his moist lips as he chewed something, and flourishing his arm, called him to enter.

"Bolkonski! Bolkonski!... Don't you hear? Eh? Come quick..." he shouted.

Entering the house, Prince Andrew saw Nesvitski and another adjutant having something to eat. They hastily turned round to him asking if he had any news. On their familiar faces he read agitation and alarm. This was particularly noticeable on Nesvitski's usually laughing countenance.

"Where is the commander in chief?" asked Bolkonski.

"Here, in that house," answered the adjutant.

"Well, is it true that it's peace and capitulation?" asked Nesvitski.

"I was going to ask you. I know nothing except that it was all I could do to get here."

"And we, my dear boy! It's terrible! I was wrong to laugh at Mack, we're getting it still worse," said Nesvitski. "But sit down and have something to eat."

"You won't be able to find either your baggage or anything else now, Prince. And God only knows where your man Peter is," said the other adjutant.

"Where are headquarters?"

"We are to spend the night in Znaim."

"Well, I have got all I need into packs for two horses," said Nesvitski. "They've made up splendid packs for me--fit to cross the Bohemian mountains with. It's a bad lookout, old fellow! But what's the matter with you? You must be ill to shiver like that," he added, noticing that Prince Andrew winced as at an electric shock.

"It's nothing," replied Prince Andrew.

He had just remembered his recent encounter with the doctor's wife and the convoy officer.

"What is the commander in chief doing here?" he asked.

"I can't make out at all," said Nesvitski.

"Well, all I can make out is that everything is abominable, abominable, quite abominable!" said Prince Andrew, and he went off to the house where the commander in chief was.

Passing by Kutuzov's carriage and the exhausted saddle horses of his suite, with their Cossacks who were talking loudly together, Prince Andrew entered the passage. Kutuzov himself, he was told, was in the house with Prince Bagration and Weyrother. Weyrother was the Austrian general who had succeeded Schmidt. In the passage little Kozlovski was squatting on his heels in front of a clerk. The clerk, with cuffs turned up, was hastily writing at a tub turned bottom upwards. Kozlovski's face looked worn--he too had evidently not slept all night. He glanced at Prince Andrew and did not even nod to him.

"Second line... have you written it?" he continued dictating to the clerk. "The Kiev Grenadiers, Podolian..."

"One can't write so fast, your honor," said the clerk, glancing angrily and disrespectfully at Kozlovski.

Through the door came the sounds of Kutuzov's voice, excited and dissatisfied, interrupted by another, an unfamiliar voice. From the sound of these voices, the inattentive way Kozlovski looked at him, the disrespectful manner of the exhausted clerk, the fact that the clerk and Kozlovski were squatting on the floor by a tub so near to the commander in chief, and from the noisy laughter of the Cossacks holding the horses near the window, Prince Andrew felt that something important and disastrous was about to happen.

He turned to Kozlovski with urgent questions.

"Immediately, Prince," said Kozlovski. "Dispositions for Bagration."

"What about capitulation?"

"Nothing of the sort. Orders are issued for a battle."

Prince Andrew moved toward the door from whence voices were heard. Just as he was going to open it the sounds ceased, the door opened, and Kutuzov with his eagle nose and puffy face appeared in the doorway. Prince Andrew stood right in front of Kutuzov but the expression of the commander in chief's one sound eye showed him to be so preoccupied with thoughts and anxieties as to be oblivious of his presence. He looked straight at his adjutant's face without recognizing him.

"Well, have you finished?" said he to Kozlovski.

"One moment, your excellency."

Bagration, a gaunt middle-aged man of medium height with a firm, impassive face of Oriental type, came out after the commander in chief.

"I have the honor to present myself," repeated Prince Andrew rather loudly, handing Kutuzov an envelope.

"Ah, from Vienna? Very good. Later, later!"

Kutuzov went out into the porch with Bagration.

"Well, good-by, Prince," said he to Bagration. "My blessing, and may Christ be with you in your great endeavor!"

His face suddenly softened and tears came into his eyes. With his left hand he drew Bagration toward him, and with his right, on which he wore a ring, he made the sign of the cross over him with a gesture evidently habitual, offering his puffy cheek, but Bagration kissed him on the neck instead.

"Christ be with you!" Kutuzov repeated and went toward his carriage.
"Get in with me," said he to Bolkonski.

"Your excellency, I should like to be of use here. Allow me to remain with Prince Bagration's detachment."

"Get in," said Kutuzov, and noticing that Bolkonski still delayed, he added: "I need good officers myself, need them myself!"

They got into the carriage and drove for a few minutes in silence.

"There is still much, much before us," he said, as if with an old man's penetration he understood all that was passing in Bolkonski's mind. "If a tenth part of his detachment returns I shall thank God," he added as if speaking to himself.

Prince Andrew glanced at Kutuzov's face only a foot distant from him and involuntarily noticed the carefully washed seams of the scar near his temple, where an Ismail bullet had pierced his skull, and the empty eye socket. "Yes, he has a right to speak so calmly of those men's death," thought Bolkonski.

"That is why I beg to be sent to that detachment," he said.

Kutuzov did not reply. He seemed to have forgotten what he had been saying, and sat plunged in thought. Five minutes later, gently swaying on the soft springs of the carriage, he turned to Prince Andrew. There was not a trace of agitation on his face. With delicate irony he questioned Prince Andrew about the details of his interview with the Emperor, about the remarks he had heard at court concerning the Krems affair, and about some ladies they both knew.

CHAPTER XIV

On November 1 Kutuzov had received, through a spy, news that the army he commanded was in an almost hopeless position. The spy reported that the French, after crossing the bridge at Vienna, were advancing in immense force upon Kutuzov's line of communication with the troops that were arriving from Russia. If Kutuzov decided to remain at Krems, Napoleon's army of one hundred and fifty thousand men would cut him off completely and surround his exhausted army of forty thousand, and he would find himself in the position of Mack at Ulm. If Kutuzov decided to abandon the road connecting him with the troops arriving from Russia, he would have to march with no road into unknown parts of the Bohemian mountains, defending himself against superior forces of the enemy and abandoning all hope of a junction with Buxhowden. If Kutuzov decided to retreat along the road from Krems to Olmutz, to unite with the troops arriving from Russia, he risked being forestalled on that road by the French who had crossed the Vienna bridge, and encumbered by his baggage and transport, having to accept battle on the march against an enemy three times as strong, who would hem him in from two sides.

Kutuzov chose this latter course.

The French, the spy reported, having crossed the Vienna bridge, were advancing by forced marches toward Znaim, which lay sixty-six miles off on the line of Kutuzov's retreat. If he reached Znaim before the French, there would be great hope of saving the army; to let the French forestall him at Znaim meant the exposure of his whole army to a disgrace such as that of Ulm, or to utter destruction. But to forestall the French with his whole army was impossible. The road for the French from Vienna to Znaim was shorter and better than the road for the Russians from Krems to Znaim.

The night he received the news, Kutuzov sent Bagration's vanguard, four thousand strong, to the right across the hills from the Krems-Znaim to the Vienna-Znaim road. Bagration was to make this march

without resting, and to halt facing Vienna with Znaim to his rear, and if he succeeded in forestalling the French he was to delay them as long as possible. Kutuzov himself with all his transport took the road to Znaim.

Marching thirty miles that stormy night across roadless hills, with his hungry, ill-shod soldiers, and losing a third of his men as stragglers by the way, Bagration came out on the Vienna-Znaim road at Hollabrunn a few hours ahead of the French who were approaching Hollabrunn from Vienna. Kutuzov with his transport had still to march for some days before he could reach Znaim. Hence Bagration with his four thousand hungry, exhausted men would have to detain for days the whole enemy army that came upon him at Hollabrunn, which was clearly impossible. But a freak of fate made the impossible possible. The success of the trick that had placed the

Vienna bridge in the hands of the French without a fight led Murat to try to deceive Kutuzov in a similar way. Meeting Bagration's weak detachment on the Znaim road he supposed it to be Kutuzov's whole army. To be able to crush it absolutely he awaited the arrival of the rest of the troops who were on their way from Vienna, and with this object offered a three days' truce on condition that both armies should remain in position without moving. Murat declared that negotiations for peace were already proceeding, and that he therefore offered this truce to avoid unnecessary bloodshed. Count Nostitz, the Austrian general occupying the advanced posts, believed Murat's emissary and retired, leaving Bagration's division exposed. Another emissary rode to the Russian line to announce the peace negotiations and to offer the Russian army the three days' truce. Bagration replied that he was not authorized either to accept or refuse a truce and sent his adjutant to Kutuzov to report the offer he had received.

A truce was Kutuzov's sole chance of gaining time, giving Bagration's exhausted troops some rest, and letting the transport and heavy convoys (whose movements were concealed from the French) advance if but one stage nearer Znaim. The offer of a truce gave the only, and a quite unexpected, chance of saving the army. On receiving the news he immediately dispatched Adjutant General Wintzingerode, who was in attendance on him, to the enemy camp. Wintzingerode was not merely to agree to the truce but also to offer terms of capitulation, and meanwhile Kutuzov sent his adjutants back to hasten to the utmost the movements of the baggage trains of the entire army along the Krems-Znaim road. Bagration's exhausted and hungry detachment, which alone covered this movement of the transport and of the whole army, had to remain stationary in face of an enemy eight times as strong as itself.

Kutuzov's expectations that the proposals of capitulation (which were in no way binding) might give time for part of the transport to pass, and also that Murat's mistake would very soon be discovered, proved correct. As soon as Bonaparte (who was at Schonbrunn, sixteen miles from Hollabrunn) received Murat's dispatch with the proposal of a truce and a capitulation, he detected a ruse and wrote the following letter to Murat:

Schonbrunn, 25th Brumaire, 1805,

at eight o'clock in the morning

To PRINCE MURAT,

I cannot find words to express to you my displeasure. You command only my advance guard, and have no right to arrange an armistice without my order. You are causing me to lose the fruits of a campaign. Break the armistice immediately and march on the enemy. Inform him that the general who signed that capitulation had no right to do so, and that no one but the Emperor of Russia has that right.

If, however, the Emperor of Russia ratifies that convention, I will ratify it; but it is only a trick. March on, destroy the Russian army.... You are in a position to seize its baggage and artillery.

The Russian Emperor's aide-de-camp is an impostor. Officers are nothing when they have no powers; this one had none.... The Austrians let themselves be tricked at the crossing of the Vienna bridge, you are letting yourself be tricked by an aide-de-camp of the Emperor.

NAPOLEON

Bonaparte's adjutant rode full gallop with this menacing letter to Murat. Bonaparte himself, not trusting to his generals, moved with all the Guards to the field of battle, afraid of letting a ready victim escape, and Bagration's four thousand men merrily lighted campfires, dried and warmed themselves, cooked their porridge for the first time for three days, and not one of them knew or imagined what was in store for him.

CHAPTER XV

Between three and four o'clock in the afternoon Prince Andrew, who had persisted in his request to Kutuzov, arrived at Grunth and reported himself to Bagration. Bonaparte's adjutant had not yet reached Murat's detachment and the battle had not yet begun. In Bagration's detachment no one knew anything of the general position of affairs. They talked of peace but did not believe in its possibility; others talked of a battle but also disbelieved in the nearness of an engagement. Bagration, knowing Bolkonski to be a favorite and trusted adjutant, received him with distinction and special marks of favor, explaining to him that there would probably be an engagement that day or the next, and giving him full liberty to remain with him during the battle or to join the rearguard and have an eye on the order of retreat, "which is also very important."

"However, there will hardly be an engagement today," said Bagration as if to reassure Prince Andrew.

"If he is one of the ordinary little staff dandies sent to earn a medal he can get his reward just as well in the rearguard, but if he wishes to stay with me, let him... he'll be of use here if he's a brave officer," thought Bagration. Prince Andrew, without replying, asked the prince's permission to ride round the position to see the disposition of the forces, so as to know his bearings should he be sent to execute an order. The officer on duty, a handsome, elegantly dressed man with a diamond ring on his forefinger, who was fond of speaking French though he spoke it badly, offered to conduct Prince Andrew.

On all sides they saw rain-soaked officers with dejected faces who seemed to be seeking something, and soldiers dragging doors, benches, and fencing from the village.

"There now, Prince! We can't stop those fellows," said the staff officer pointing to the soldiers. "The officers don't keep them in hand. And there," he pointed to a sutler's tent, "they crowd in and sit. This morning I turned them all out and now look, it's full again. I must go there, Prince, and scare them a bit. It won't take a moment."

"Yes, let's go in and I will get myself a roll and some cheese," said Prince Andrew who had not yet had time to eat anything.

"Why didn't you mention it, Prince? I would have offered you something."

They dismounted and entered the tent. Several officers, with flushed and weary faces, were sitting at the table eating and drinking.

"Now what does this mean, gentlemen?" said the staff officer, in the reproachful tone of a man who has repeated the same thing more than once. "You know it won't do to leave your posts like this. The prince gave orders that no one should leave his post. Now you, Captain," and he turned to a thin, dirty little artillery officer who without his boots (he had given them to the canteen keeper to dry), in only his stockings, rose when they entered, smiling not altogether comfortably.

"Well, aren't you ashamed of yourself, Captain Tushin?" he continued. "One would think that as an artillery officer you would set a good example, yet here you are without your boots! The alarm will be sounded and you'll be in a pretty position without your boots!" (The staff officer smiled.) "Kindly return to your posts, gentlemen, all of you, all!" he added in a tone of command.

Prince Andrew smiled involuntarily as he looked at the artillery officer Tushin, who silent and smiling, shifting from one stockinginged foot to the other, glanced inquiringly with his large, intelligent, kindly eyes from Prince Andrew to the staff officer.

"The soldiers say it feels easier without boots," said Captain Tushin smiling shyly in his uncomfortable position, evidently wishing to adopt a jocular tone. But before he had finished he felt that his jest was unacceptable and had not come off. He grew confused.

"Kindly return to your posts," said the staff officer trying to preserve his gravity.

Prince Andrew glanced again at the artillery officer's small figure. There was something peculiar about it, quite unsoldierly, rather comic, but extremely attractive.

The staff officer and Prince Andrew mounted their horses and rode on.

Having ridden beyond the village, continually meeting and overtaking soldiers and officers of various regiments, they saw on their left some entrenchments being thrown up, the freshly dug clay of which showed up red. Several battalions of soldiers, in their shirt sleeves despite the cold wind, swarmed in these earthworks like a host of white ants; spadefuls of red clay were continually being thrown up from behind the bank by unseen hands. Prince Andrew and the officer rode up, looked at the entrenchment, and went on again. Just behind it they came upon some dozens of soldiers, continually replaced by others, who ran from the entrenchment. They had to hold their noses and put their horses to a trot to escape from the poisoned atmosphere of these latrines.

"Voila l'agrement des camps, monsieur le Prince,"* said the staff officer.

*"This is a pleasure one gets in camp, Prince."

They rode up the opposite hill. From there the French could already be seen. Prince Andrew stopped and began examining the position.

"That's our battery," said the staff officer indicating the highest point. "It's in charge of the queer fellow we saw without his boots. You can see everything from there; let's go there, Prince."

"Thank you very much, I will go on alone," said Prince Andrew, wishing to rid himself of this staff officer's company, "please don't trouble yourself further."

The staff officer remained behind and Prince Andrew rode on alone.

The farther forward and nearer the enemy he went, the more orderly and cheerful were the troops. The greatest disorder and depression had been in the baggage train he had passed that morning on the Znaim road seven miles away from the French. At Grunth also some apprehension and alarm could be felt, but the nearer Prince Andrew came to the French lines the more confident was the appearance of our troops. The soldiers in their greatcoats were ranged in lines, the sergeants major and company officers were counting the men, poking the last man in each section in the ribs and telling him to hold his hand up. Soldiers scattered over the whole place were dragging logs and brushwood and were building shelters with merry chatter and laughter; around the fires sat others, dressed and undressed, drying their shirts and leg bands or mending boots or overcoats and crowding round the boilers and porridge cookers. In one company dinner was ready, and the soldiers were gazing eagerly at the steaming boiler, waiting till the sample, which a quartermaster sergeant was carrying in a wooden bowl to an officer who sat on a log before his shelter, had been tasted.

Another company, a lucky one for not all the companies had vodka, crowded round a pock-marked, broad-shouldered sergeant major who, tilting a keg, filled one after another the canteen lids held out to him. The soldiers lifted the canteen lids to their lips with reverential faces, emptied them, rolling the vodka in their mouths, and walked away from the sergeant major with brightened expressions, licking their lips and wiping them on the sleeves of their greatcoats. All their faces were as serene as if all this were happening at home awaiting peaceful encampment, and not within sight of the enemy before an action in which at least half of them would be left on the field. After passing a chasseur regiment and in the lines of the Kiev grenadiers--fine fellows busy with similar peaceful affairs--near the shelter of the regimental commander, higher than and different from the others, Prince Andrew came out in front of a platoon of grenadiers before whom lay a naked man. Two soldiers held him while two others were flourishing their switches and striking him regularly on his bare back. The man shrieked unnaturally. A stout major was pacing up and down the line, and regardless of the screams kept repeating:

"It's a shame for a soldier to steal; a soldier must be honest, honorable, and brave, but if he robs his fellows there is no honor in him, he's a scoundrel. Go on! Go on!"

So the swishing sound of the strokes, and the desperate but unnatural screams, continued.

"Go on, go on!" said the major.

A young officer with a bewildered and pained expression on his face stepped away from the man and looked round inquiringly at the adjutant as he rode by.

Prince Andrew, having reached the front line, rode along it. Our front line and that of the enemy were far apart on the right and left flanks, but in the center where the men with a flag of truce had passed that morning, the lines were so near together that the men could see one another's faces and speak to one another. Besides the soldiers who formed the picket line on either side, there were many curious onlookers who, jesting and laughing, stared at their strange foreign enemies.

Since early morning--despite an injunction not to approach the picket line--the officers had been unable to keep sight-seers away. The soldiers forming the picket line, like showmen exhibiting a

curiosity, no longer looked at the French but paid attention to the sight-seers and grew weary waiting to be relieved. Prince Andrew halted to have a look at the French.

"Look! Look there!" one soldier was saying to another, pointing to a Russian musketeer who had gone up to the picket line with an officer and was rapidly and excitedly talking to a French grenadier. "Hark to him jabbering! Fine, isn't it? It's all the Frenchy can do to keep up with him. There now, Sidorov!"

"Wait a bit and listen. It's fine!" answered Sidorov, who was considered an adept at French.

The soldier to whom the laughers referred was Dolokhov. Prince Andrew recognized him and stopped to listen to what he was saying. Dolokhov had come from the left flank where their regiment was stationed, with his captain.

"Now then, go on, go on!" incited the officer, bending forward and trying not to lose a word of the speech which was incomprehensible to him. "More, please: more! What's he saying?"

Dolokhov did not answer the captain; he had been drawn into a hot dispute with the French grenadier. They were naturally talking about the campaign. The Frenchman, confusing the Austrians with the Russians, was trying to prove that the Russians had surrendered and had fled all the way from Ulm, while Dolokhov maintained that the Russians had not surrendered but had beaten the French.

"We have orders to drive you off here, and we shall drive you off," said Dolokhov.

"Only take care you and your Cossacks are not all captured!" said the French grenadier.

The French onlookers and listeners laughed.

"We'll make you dance as we did under Suvorov...,"* said Dolokhov.

*"On vous fera danser."

"Qu' est-ce qu'il chante?"* asked a Frenchman.

*"What's he singing about?"

"It's ancient history," said another, guessing that it referred to a former war. "The Emperor will teach your Suvara as he has taught the others..."

"Bonaparte..." began Dolokhov, but the Frenchman interrupted him.

"Not Bonaparte. He is the Emperor! Sacre nom...!" cried he angrily.

"The devil skin your Emperor."

And Dolokhov swore at him in coarse soldier's Russian and shouldering his musket walked away.

"Let us go, Ivan Lukich," he said to the captain.

"Ah, that's the way to talk French," said the picket soldiers. "Now, Sidorov, you have a try!"

Sidorov, turning to the French, winked, and began to jabber meaningless sounds very fast: "Kari, mala, tafa, safi, muter, Kaska," he said, trying to give an expressive intonation to his voice.

"Ho! ho! ho! Ha! ha! ha! Ouh! ouh!" came peals of such healthy and good-humored laughter from the soldiers that it infected the French involuntarily, so much so that the only thing left to do seemed to be to unload the muskets, muskets, explode the ammunition, and all return home as quickly as possible.

But the guns remained loaded, the loopholes in blockhouses and entrenchments looked out just as menacingly, and the unlimbered cannon confronted one another as before.

CHAPTER XVI

Having ridden round the whole line from right flank to left, Prince Andrew made his way up to the battery from which the staff officer had told him the whole field could be seen. Here he dismounted, and stopped beside the farthest of the four unlimbered cannon. Before the guns an artillery sentry was pacing up and down; he stood at attention when the officer arrived, but at a sign resumed his measured, monotonous pacing. Behind the guns were their limbers and still farther back picket ropes and artillerymen's bonfires. To the left, not far from the farthest cannon, was a small, newly constructed wattle shed from which came the sound of officers' voices in eager conversation.

It was true that a view over nearly the whole Russian position and the greater part of the enemy's opened out from this battery. Just facing it, on the crest of the opposite hill, the village of Schon Grabern could be seen, and in three places to left and right the French troops amid the smoke of their campfires, the greater part of whom were evidently in the village itself and behind the hill. To the left from that village, amid the smoke, was something resembling a battery, but it was impossible to see it clearly with the naked eye. Our right flank was posted on a rather steep incline which dominated the French position. Our infantry were stationed there, and at the farthest point the dragoons. In the center, where Tushin's battery stood and from which Prince Andrew was surveying the position, was the easiest and most direct descent and ascent to the brook separating us from Schon Grabern. On the left our troops were close to a copse, in which smoked the bonfires of our infantry who were felling wood. The French line was wider than ours, and it was plain that they could easily outflank us on both sides. Behind our position was a steep and deep dip, making it difficult for artillery and cavalry to retire. Prince Andrew took out his notebook and, leaning on the cannon, sketched a plan of the position. He made some notes on two points, intending to mention them to Bagration. His idea was, first, to concentrate all the artillery in the center, and secondly, to withdraw the cavalry to the other side of the dip. Prince Andrew, being always near the commander in chief, closely following the mass movements and general orders, and constantly studying historical accounts of battles, involuntarily pictured to himself the course of events in the forthcoming action in broad outline. He imagined only important possibilities: "If the enemy attacks the right flank," he said to himself, "the Kiev grenadiers and the Podolsk chasseurs must hold their position till reserves from the center come up. In that case the dragoons could successfully make a flank counterattack. If they attack our center we, having the center battery on this high ground, shall withdraw the left flank under its cover, and retreat to the dip by echelons." So he reasoned.... All the time he had been beside the gun, he had heard the voices of the officers distinctly, but as often happens had not understood a word of what they were saying. Suddenly, however, he was struck by a voice coming from the shed, and its tone was so sincere that he could not but listen.

"No, friend," said a pleasant and, as it seemed to Prince Andrew,

a familiar voice, "what I say is that if it were possible to know what is beyond death, none of us would be afraid of it. That's so, friend."

Another, a younger voice, interrupted him: "Afraid or not, you can't escape it anyhow."

"All the same, one is afraid! Oh, you clever people," said a third manly voice interrupting them both. "Of course you artillery men are very wise, because you can take everything along with you--vodka and snacks."

And the owner of the manly voice, evidently an infantry officer, laughed.

"Yes, one is afraid," continued the first speaker, he of the familiar voice. "One is afraid of the unknown, that's what it is. Whatever we may say about the soul going to the sky... we know there is no sky but only an atmosphere."

The manly voice again interrupted the artillery officer.

"Well, stand us some of your herb vodka, Tushin," it said.

"Why," thought Prince Andrew, "that's the captain who stood up in the sutler's hut without his boots." He recognized the agreeable, philosophizing voice with pleasure.

"Some herb vodka? Certainly!" said Tushin. "But still, to conceive a future life..."

He did not finish. Just then there was a whistle in the air; nearer and nearer, faster and louder, louder and faster, a cannon ball, as if it had not finished saying what was necessary, thudded into the ground near the shed with super human force, throwing up a mass of earth. The ground seemed to groan at the terrible impact.

And immediately Tushin, with a short pipe in the corner of his mouth and his kind, intelligent face rather pale, rushed out of the shed followed by the owner of the manly voice, a dashing infantry officer who hurried off to his company, buttoning up his coat as he ran.

CHAPTER XVII

Mounting his horse again Prince Andrew lingered with the battery, looking at the puff from the gun that had sent the ball. His eyes ran rapidly over the wide space, but he only saw that the hitherto motionless masses of the French now swayed and that there really was a battery to their left. The smoke above it had not yet dispersed. Two mounted Frenchmen, probably adjutants, were galloping up the hill. A small but distinctly visible enemy column was moving down the hill, probably to strengthen the front line. The smoke of the first shot had not yet dispersed before another puff appeared, followed by a report. The battle had begun! Prince Andrew turned his horse and galloped back to Grunth to find Prince Bagration. He heard the cannonade behind him growing louder and more frequent. Evidently our guns had begun to reply. From the bottom of the slope, where the parleys had taken place, came the report of musketry.

Lemarroijs had just arrived at a gallop with Bonaparte's stern letter, and Murat, humiliated and anxious to expiate his fault, had at once moved his forces to attack the center and outflank both the Russian wings, hoping before evening and before the arrival of the Emperor to crush the contemptible detachment that stood before him.

"It has begun. Here it is!" thought Prince Andrew, feeling the blood

rush to his heart. "But where and how will my Toulon present itself?"

Passing between the companies that had been eating porridge and drinking vodka a quarter of an hour before, he saw everywhere the same rapid movement of soldiers forming ranks and getting their muskets ready, and on all their faces he recognized the same eagerness that filled his heart. "It has begun! Here it is, dreadful but enjoyable!" was what the face of each soldier and each officer seemed to say.

Before he had reached the embankments that were being thrown up, he saw, in the light of the dull autumn evening, mounted men coming toward him. The foremost, wearing a Cossack cloak and lambskin cap and riding a white horse, was Prince Bagration. Prince Andrew stopped, waiting for him to come up; Prince Bagration reined in his horse and recognizing Prince Andrew nodded to him. He still looked ahead while Prince Andrew told him what he had seen.

The feeling, "It has begun! Here it is!" was seen even on Prince Bagration's hard brown face with its half-closed, dull, sleepy eyes. Prince Andrew gazed with anxious curiosity at that impassive face and wished he could tell what, if anything, this man was thinking and feeling at that moment. "Is there anything at all behind that impassive face?" Prince Andrew asked himself as he looked. Prince Bagration bent his head in sign of agreement with what Prince Andrew told him, and said, "Very good!" in a tone that seemed to imply that everything that took place and was reported to him was exactly what he had foreseen. Prince Andrew, out of breath with his rapid ride, spoke quickly. Prince Bagration, uttering his words with an Oriental accent, spoke particularly slowly, as if to impress the fact that there was no need to hurry. However, he put his horse to a trot in the direction of Tushin's battery. Prince Andrew followed with the suite. Behind Prince Bagration rode an officer of the suite, the prince's personal adjutant, Zherkov, an orderly officer, the staff officer on duty, riding a fine bobtailed horse, and a civilian--an accountant who had asked permission to be present at the battle out of curiosity. The accountant, a stout, full-faced man, looked around him with a naive smile of satisfaction and presented a strange appearance among the hussars, Cossacks, and adjutants, in his camlet coat, as he jolted on his horse with a convoy officer's saddle.

"He wants to see a battle," said Zherkov to Bolkonski, pointing to the accountant, "but he feels a pain in the pit of his stomach already."

"Oh, leave off!" said the accountant with a beaming but rather cunning smile, as if flattered at being made the subject of Zherkov's joke, and purposely trying to appear stupider than he really was.

"It is very strange, mon Monsieur Prince," said the staff officer. (He remembered that in French there is some peculiar way of addressing a prince, but could not get it quite right.)

By this time they were all approaching Tushin's battery, and a ball struck the ground in front of them.

"What's that that has fallen?" asked the accountant with a naive smile.

"A French pancake," answered Zherkov.

"So that's what they hit with?" asked the accountant. "How awful!"

He seemed to swell with satisfaction. He had hardly finished speaking when they again heard an unexpectedly violent whistling which suddenly ended with a thud into something soft... f-f-flop! and a Cossack, riding a little to their right and behind the accountant, crashed to earth with his horse. Zherkov and the staff officer bent over their saddles and turned their horses away. The accountant

stopped, facing the Cossack, and examined him with attentive curiosity. The Cossack was dead, but the horse still struggled.

Prince Bagration screwed up his eyes, looked round, and, seeing the cause of the confusion, turned away with indifference, as if to say, "Is it worth while noticing trifles?" He reined in his horse with the case of a skillful rider and, slightly bending over, disengaged his saber which had caught in his cloak. It was an old-fashioned saber of a kind no longer in general use. Prince Andrew remembered the story of Suvorov giving his saber to Bagration in Italy, and the recollection was particularly pleasant at that moment. They had reached the battery at which Prince Andrew had been when he examined the battlefield.

"Whose company?" asked Prince Bagration of an artilleryman standing by the ammunition wagon.

He asked, "Whose company?" but he really meant, "Are you frightened here?" and the artilleryman understood him.

"Captain Tushin's, your excellency!" shouted the red-haired, freckled gunner in a merry voice, standing to attention.

"Yes, yes," muttered Bagration as if considering something, and he rode past the limbers to the farthest cannon.

As he approached, a ringing shot issued from it deafening him and his suite, and in the smoke that suddenly surrounded the gun they could see the gunners who had seized it straining to roll it quickly back to its former position. A huge, broad-shouldered gunner, Number One, holding a mop, his legs far apart, sprang to the wheel; while Number Two with a trembling hand placed a charge in the cannon's mouth. The short, round-shouldered Captain Tushin, stumbling over the tail of the gun carriage, moved forward and, not noticing the general, looked out shading his eyes with his small hand.

"Lift it two lines more and it will be just right," cried he in a feeble voice to which he tried to impart a dashing note, ill suited to his weak figure. "Number Two!" he squeaked. "Fire, Medvedev!"

Bagration called to him, and Tushin, raising three fingers to his cap with a bashful and awkward gesture not at all like a military salute but like a priest's benediction, approached the general. Though Tushin's guns had been intended to cannonade the valley, he was firing incendiary balls at the village of Schon Grabern visible just opposite, in front of which large masses of French were advancing.

No one had given Tushin orders where and at what to fire, but after consulting his sergeant major, Zakharchenko, for whom he had great respect, he had decided that it would be a good thing to set fire to the village. "Very good!" said Bagration in reply to the officer's report, and began deliberately to examine the whole battlefield extended before him. The French had advanced nearest on our right. Below the height on which the Kiev regiment was stationed, in the hollow where the rivulet flowed, the soul-stirring rolling and crackling of musketry was heard, and much farther to the right beyond the dragoons, the officer of the suite pointed out to Bagration a French column that was outflanking us. To the left the horizon bounded by the adjacent wood. Prince Bagration ordered two battalions from the center to be sent to reinforce the right flank. The officer of the suite ventured to remark to the prince that if these battalions went away, the guns would remain without support. Prince Bagration turned to the officer and with his dull eyes looked at him in silence. It seemed to Prince Andrew that the officer's remark was just and that really no answer could be made to it. But at that moment an adjutant galloped up with a message from the commander of the regiment in the hollow and news that immense masses of the French were coming down upon them and that his regiment was in disorder and was retreating upon the Kiev grenadiers. Prince Bagration bowed his head in sign of assent and approval. He rode off

at a walk to the right and sent an adjutant to the dragoons with orders to attack the French. But this adjutant returned half an hour later with the news that the commander of the dragoons had already retreated beyond the dip in the ground, as a heavy fire had been opened on him and he was losing men uselessly, and so had hastened to throw some sharpshooters into the wood.

"Very good!" said Bagration.

As he was leaving the battery, firing was heard on the left also, and as it was too far to the left flank for him to have time to go there himself, Prince Bagration sent Zherkov to tell the general in command (the one who had paraded his regiment before Kutuzov at Braunau) that he must retreat as quickly as possible behind the hollow in the rear, as the right flank would probably not be able to withstand the enemy's attack very long. About Tushin and the battalion that had been in support of his battery all was forgotten. Prince Andrew listened attentively to Bagration's colloquies with the commanding officers and the orders he gave them and, to his surprise, found that no orders were really given, but that Prince Bagration tried to make it appear that everything done by necessity, by accident, or by the will of subordinate commanders was done, if not by his direct command, at least in accord with his intentions. Prince Andrew noticed, however, that though what happened was due to chance and was independent of the commander's will, owing to the tact Bagration showed, his presence was very valuable. Officers who approached him with disturbed countenances became calm; soldiers and officers greeted him gaily, grew more cheerful in his presence, and were evidently anxious to display their courage before him.

CHAPTER XVIII

Prince Bagration, having reached the highest point of our right flank, began riding downhill to where the roll of musketry was heard but where on account of the smoke nothing could be seen. The nearer they got to the hollow the less they could see but the more they felt the nearness of the actual battlefield. They began to meet wounded men. One with a bleeding head and no cap was being dragged along by two soldiers who supported him under the arms. There was a gurgle in his throat and he was spitting blood. A bullet had evidently hit him in the throat or mouth. Another was walking sturdily by himself but without his musket, groaning aloud and swinging his arm which had just been hurt, while blood from it was streaming over his greatcoat as from a bottle. He had that moment been wounded and his face showed fear rather than suffering. Crossing a road they descended a steep incline and saw several men lying on the ground; they also met a crowd of soldiers some of whom were unwounded. The soldiers were ascending the hill breathing heavily, and despite the general's presence were talking loudly and gesticulating. In front of them rows of gray cloaks were already visible through the smoke, and an officer catching sight of Bagration rushed shouting after the crowd of retreating soldiers, ordering them back. Bagration rode up to the ranks along which shots crackled now here and now there, drowning the sound of voices and the shouts of command. The whole air reeked with smoke. The excited faces of the soldiers were blackened with it. Some were using their ramrods, others putting powder on the touchpans or taking charges from their pouches, while others were firing, though who they were firing at could not be seen for the smoke which there was no wind to carry away. A pleasant humming and whistling of bullets were often heard. "What is this?" thought Prince Andrew approaching the crowd of soldiers. "It can't be an attack, for they are not moving; it can't be a square--for they are not drawn up for that."

The commander of the regiment, a thin, feeble-looking old man with a

pleasant smile--his eyelids drooping more than half over his old eyes, giving him a mild expression, rode up to Bagration and welcomed him as a host welcomes an honored guest. He reported that his regiment had been attacked by French cavalry and that, though the attack had been repulsed, he had lost more than half his men. He said the attack had been repulsed, employing this military term to describe what had occurred to his regiment, but in reality he did not himself know what had happened during that half-hour to the troops entrusted to him, and could not say with certainty whether the attack had been repulsed or his regiment had been broken up. All he knew was that at the commencement of the action balls and shells began flying all over his regiment and hitting men and that afterwards someone had shouted "Cavalry!" and our men had begun firing. They were still firing, not at the cavalry which had disappeared, but at French infantry who had come into the hollow and were firing at our men. Prince Bagration bowed his head as a sign that this was exactly what he had desired and expected. Turning to his adjutant he ordered him to bring down the two battalions of the Sixth Chasseurs whom they had just passed. Prince Andrew was struck by the changed expression on Prince Bagration's face at this moment. It expressed the concentrated and happy resolution you see on the face of a man who on a hot day takes a final run before plunging into the water. The dull, sleepy expression was no longer there, nor the affectation of profound thought. The round, steady, hawk's eyes looked before him eagerly and rather disdainfully, not resting on anything although his movements were still slow and measured.

The commander of the regiment turned to Prince Bagration, entreating him to go back as it was too dangerous to remain where they were. "Please, your excellency, for God's sake!" he kept saying, glancing for support at an officer of the suite who turned away from him. "There, you see!" and he drew attention to the bullets whistling, singing, and hissing continually around them. He spoke in the tone of entreaty and reproach that a carpenter uses to a gentleman who has picked up an ax: "We are used to it, but you, sir, will blister your hands." He spoke as if those bullets could not kill him, and his half-closed eyes gave still more persuasiveness to his words. The staff officer joined in the colonel's appeals, but Bagration did not reply; he only gave an order to cease firing and re-form, so as to give room for the two approaching battalions. While he was speaking, the curtain of smoke that had concealed the hollow, driven by a rising wind, began to move from right to left as if drawn by an invisible hand, and the hill opposite, with the French moving about on it, opened out before them. All eyes fastened involuntarily on this French column advancing against them and winding down over the uneven ground. One could already see the soldiers' shaggy caps, distinguish the officers from the men, and see the standard flapping against its staff.

"They march splendidly," remarked someone in Bagration's suite.

The head of the column had already descended into the hollow. The clash would take place on this side of it...

The remains of our regiment which had been in action rapidly formed up and moved to the right; from behind it, dispersing the laggards, came two battalions of the Sixth Chasseurs in fine order. Before they had reached Bagration, the weighty tread of the mass of men marching in step could be heard. On their left flank, nearest to Bagration, marched a company commander, a fine round-faced man, with a stupid and happy expression--the same man who had rushed out of the wattle shed. At that moment he was clearly thinking of nothing but how dashing a fellow he would appear as he passed the commander.

With the self-satisfaction of a man on parade, he stepped lightly with his muscular legs as if sailing along, stretching himself to his full height without the smallest effort, his ease contrasting with the heavy tread of the soldiers who were keeping step with him. He carried close to his leg a narrow unsheathed sword (small, curved, and not like a real weapon) and looked now at the superior officers and

now back at the men without losing step, his whole powerful body turning flexibly. It was as if all the powers of his soul were concentrated on passing the commander in the best possible manner, and feeling that he was doing it well he was happy. "Left... left... left..." he seemed to repeat to himself at each alternate step; and in time to this, with stern but varied faces, the wall of soldiers burdened with knapsacks and muskets marched in step, and each one of these hundreds of soldiers seemed to be repeating to himself at each alternate step, "Left... left... left..." A fat major skirted a bush, puffing and falling out of step; a soldier who had fallen behind, his face showing alarm at his defection, ran at a trot, panting to catch up with his company. A cannon ball, cleaving the air, flew over the heads of Bagration and his suite, and fell into the column to the measure of "Left... left!" "Close up!" came the company commander's voice in jaunty tones. The soldiers passed in a semicircle round something where the ball had fallen, and an old trooper on the flank, a noncommissioned officer who had stopped beside the dead men, ran to catch up his line and, falling into step with a hop, looked back angrily, and through the ominous silence and the regular tramp of feet beating the ground in unison, one seemed to hear left... left... left.

"Well done, lads!" said Prince Bagration.

"Glad to do our best, your ex'len-lency!" came a confused shout from the ranks. A morose soldier marching on the left turned his eyes on Bagration as he shouted, with an expression that seemed to say: "We know that ourselves!" Another, without looking round, as though fearing to relax, shouted with his mouth wide open and passed on.

The order was given to halt and down knapsacks.

Bagration rode round the ranks that had marched past him and dismounted. He gave the reins to a Cossack, took off and handed over his felt coat, stretched his legs, and set his cap straight. The head of the French column, with its officers leading, appeared from below the hill.

"Forward, with God!" said Bagration, in a resolute, sonorous voice, turning for a moment to the front line, and slightly swinging his arms, he went forward uneasily over the rough field with the awkward gait of a cavalryman. Prince Andrew felt that an invisible power was leading him forward, and experienced great happiness.

The French were already near. Prince Andrew, walking beside Bagration, could clearly distinguish their bandoliers, red epaulets, and even their faces. (He distinctly saw an old French officer who, with gaithered legs and turned-out toes, climbed the hill with difficulty.) Prince Bagration gave no further orders and silently continued to walk on in front of the ranks. Suddenly one shot after another rang out from the French, smoke appeared all along their uneven ranks, and musket shots sounded. Several of our men fell, among them the round-faced officer who had marched so gaily and complacently. But at the moment the first report was heard, Bagration looked round and shouted, "Hurrah!"

"Hurrah--ah!--ah!" rang a long-drawn shout from our ranks, and passing Bagration and racing one another they rushed in an irregular but joyous and eager crowd down the hill at their disordered foe.

CHAPTER XIX

The attack of the Sixth Chasseurs secured the retreat of our right flank. In the center Tushin's forgotten battery, which had managed to set fire to the Schon Grabern village, delayed the French

advance. The French were putting out the fire which the wind was spreading, and thus gave us time to retreat. The retirement of the center to the other side of the dip in the ground at the rear was hurried and noisy, but the different companies did not get mixed. But our left--which consisted of the Azov and Podolsk infantry and the Pavlograd hussars--was simultaneously attacked and outflanked by superior French forces under Lannes and was thrown into confusion. Bagration had sent Zherkov to the general commanding that left flank with orders to retreat immediately.

Zherkov, not removing his hand from his cap, turned his horse about and galloped off. But no sooner had he left Bagration than his courage failed him. He was seized by panic and could not go where it was dangerous.

Having reached the left flank, instead of going to the front where the firing was, he began to look for the general and his staff where they could not possibly be, and so did not deliver the order.

The command of the left flank belonged by seniority to the commander of the regiment Kutuzov had reviewed at Braunau and in which Dolokhov was serving as a private. But the command of the extreme left flank had been assigned to the commander of the Pavlograd regiment in which Rostov was serving, and a misunderstanding arose. The two commanders were much exasperated with one another and, long after the action had begun on the right flank and the French were already advancing, were engaged in discussion with the sole object of offending one another. But the regiments, both cavalry and infantry, were by no means ready for the impending action. From privates to general they were not expecting a battle and were engaged in peaceful occupations, the cavalry feeding the horses and the infantry collecting wood.

"He higher iss dan I in rank," said the German colonel of the hussars, flushing and addressing an adjutant who had ridden up, "so let him do what he vill, but I cannot sacrifice my hussars... Bugler, sount ze retreat!"

But haste was becoming imperative. Cannon and musketry, mingling together, thundered on the right and in the center, while the capotes of Lannes' sharpshooters were already seen crossing the milldam and forming up within twice the range of a musket shot. The general in command of the infantry went toward his horse with jerky steps, and having mounted drew himself up very straight and tall and rode to the Pavlograd commander. The commanders met with polite bows but with secret malevolence in their hearts.

"Once again, Colonel," said the general, "I can't leave half my men in the wood. I beg of you, I beg of you," he repeated, "to occupy the position and prepare for an attack."

"I peg of you yourself not to mix in vot is not your business!" suddenly replied the irate colonel. "If you vere in the cavalry..."

"I am not in the cavalry, Colonel, but I am a Russian general and if you are not aware of the fact..."

"Quite avare, your excellency," suddenly shouted the colonel, touching his horse and turning purple in the face. "Vill you be so goot to come to ze front and see dat zis position iss no goot? I don't vish to destroy my men for your pleasure!"

"You forget yourself, Colonel. I am not considering my own pleasure and I won't allow it to be said!"

Taking the colonel's outburst as a challenge to his courage, the general expanded his chest and rode, frowning, beside him to the front line, as if their differences would be settled there amongst the bullets. They reached the front, several bullets sped over them, and they halted in silence. There was nothing fresh to be seen from the

line, for from where they had been before it had been evident that it was impossible for cavalry to act among the bushes and broken ground, as well as that the French were outflanking our left. The general and colonel looked sternly and significantly at one another like two fighting cocks preparing for battle, each vainly trying to detect signs of cowardice in the other. Both passed the examination successfully. As there was nothing to said, and neither wished to give occasion for it to be alleged that he had been the first to leave the range of fire, they would have remained there for a long time testing each other's courage had it not been that just then they heard the rattle of musketry and a muffled shout almost behind them in the wood. The French had attacked the men collecting wood in the copse. It was no longer possible for the hussars to retreat with the infantry. They were cut off from the line of retreat on the left by the French. However inconvenient the position, it was now necessary to attack in order to cut away through for themselves.

The squadron in which Rostov was serving had scarcely time to mount before it was halted facing the enemy. Again, as at the Enns bridge, there was nothing between the squadron and the enemy, and again that terrible dividing line of uncertainty and fear--resembling the line separating the living from the dead--lay between them. All were conscious of this unseen line, and the question whether they would cross it or not, and how they would cross it, agitated them all.

The colonel rode to the front, angrily gave some reply to questions put to him by the officers, and, like a man desperately insisting on having his own way, gave an order. No one said anything definite, but the rumor of an attack spread through the squadron. The command to form up rang out and the sabers whizzed as they were drawn from their scabbards. Still no one moved. The troops of the left flank, infantry and hussars alike, felt that the commander did not himself know what to do, and this irresolution communicated itself to the men.

"If only they would be quick!" thought Rostov, feeling that at last the time had come to experience the joy of an attack of which he had so often heard from his fellow hussars.

"Fo'ward, with God, lads!" rang out Denisov's voice. "At a twot fo'ward!"

The horses' croups began to sway in the front line. Rook pulled at the reins and started of his own accord.

Before him, on the right, Rostov saw the front lines of his hussars and still farther ahead a dark line which he could not see distinctly but took to be the enemy. Shots could be heard, but some way off.

"Faster!" came the word of command, and Rostov felt Rook's flanks drooping as he broke into a gallop.

Rostov anticipated his horse's movements and became more and more elated. He had noticed a solitary tree ahead of him. This tree had been in the middle of the line that had seemed so terrible--and now he had crossed that line and not only was there nothing terrible, but everything was becoming more and more happy and animated. "Oh, how I will slash at him!" thought Rostov, gripping the hilt of his saber.

"Hur-a-a-a-ah!" came a roar of voices. "Let anyone come my way now," thought Rostov driving his spurs into Rook and letting him go at a full gallop so that he outstripped the others. Ahead, the enemy was already visible. Suddenly something like a birch broom seemed to sweep over the squadron. Rostov raised his saber, ready to strike, but at that instant the trooper Nikitenko, who was galloping ahead, shot away from him, and Rostov felt as in a dream that he continued to be carried forward with unnatural speed but yet stayed on the same spot. From behind him Bondarchuk, an hussar he knew, jolted against

him and looked angrily at him. Bondarchuk's horse swerved and galloped past.

"How is it I am not moving? I have fallen, I am killed!" Rostov asked and answered at the same instant. He was alone in the middle of a field. Instead of the moving horses and hussars' backs, he saw nothing before him but the motionless earth and the stubble around him. There was warm blood under his arm. "No, I am wounded and the horse is killed." Rook tried to rise on his forelegs but fell back, pinning his rider's leg. Blood was flowing from his head; he struggled but could not rise. Rostov also tried to rise but fell back, his sabretache having become entangled in the saddle. Where our men were, and where the French, he did not know. There was no one near.

Having disentangled his leg, he rose. "Where, on which side, was now the line that had so sharply divided the two armies?" he asked himself and could not answer. "Can something bad have happened to me?" he wondered as he got up: and at that moment he felt that something superfluous was hanging on his benumbed left arm. The wrist felt as if it were not his. He examined his hand carefully, vainly trying to find blood on it. "Ah, here are people coming," he thought joyfully, seeing some men running toward him. "They will help me!" In front came a man wearing a strange shako and a blue cloak, swarthy, sunburned, and with a hooked nose. Then came two more, and many more running behind. One of them said something strange, not in Russian. In among the hindmost of these men wearing similar shakos was a Russian hussar. He was being held by the arms and his horse was being led behind him.

"It must be one of ours, a prisoner. Yes. Can it be that they will take me too? Who are these men?" thought Rostov, scarcely believing his eyes. "Can they be French?" He looked at the approaching Frenchmen, and though but a moment before he had been galloping to get at them and hack them to pieces, their proximity now seemed so awful that he could not believe his eyes. "Who are they? Why are they running? Can they be coming at me? And why? To kill me? Me whom everyone is so fond of?" He remembered his mother's love for him, and his family's, and his friends', and the enemy's intention to kill him seemed impossible. "But perhaps they may do it!" For more than ten seconds he stood not moving from the spot or realizing the situation. The foremost Frenchman, the one with the hooked nose, was already so close that the expression of his face could be seen. And the excited, alien face of that man, his bayonet hanging down, holding his breath, and running so lightly, frightened Rostov. He seized his pistol and, instead of firing it, flung it at the Frenchman and ran with all his might toward the bushes. He did not now run with the feeling of doubt and conflict with which he had trodden the Enns bridge, but with the feeling of a hare fleeing from the hounds. One single sentiment, that of fear for his young and happy life, possessed his whole being. Rapidly leaping the furrows, he fled across the field with the impetuosity he used to show at catchplay, now and then turning his good-natured, pale, young face to look back. A shudder of terror went through him: "No, better not look," he thought, but having reached the bushes he glanced round once more. The French had fallen behind, and just as he looked round the first man changed his run to a walk and, turning, shouted something loudly to a comrade farther back. Rostov paused. "No, there's some mistake," thought he. "They can't have wanted to kill me." But at the same time, his left arm felt as heavy as if a seventy-pound weight were tied to it. He could run no more. The Frenchman also stopped and took aim. Rostov closed his eyes and stooped down. One bullet and then another whistled past him. He mustered his last remaining strength, took hold of his left hand with his right, and reached the bushes. Behind these were some Russian sharpshooters.

The infantry regiments that had been caught unawares in the outskirts of the wood ran out of it, the different companies getting mixed, and retreated as a disorderly crowd. One soldier, in his fear, uttered the senseless cry, "Cut off!" that is so terrible in battle, and that word infected the whole crowd with a feeling of panic.

"Surrounded! Cut off? We're lost!" shouted the fugitives.

The moment he heard the firing and the cry from behind, the general realized that something dreadful had happened to his regiment, and the thought that he, an exemplary officer of many years' service who had never been to blame, might be held responsible at headquarters for negligence or inefficiency so staggered him that, forgetting the recalcitrant cavalry colonel, his own dignity as a general, and above all quite forgetting the danger and all regard for self-preservation, he clutched the crupper of his saddle and, spurring his horse, galloped to the regiment under a hail of bullets which fell around, but fortunately missed him. His one desire was to know what was happening and at any cost correct, or remedy, the mistake if he had made one, so that he, an exemplary officer of twenty-two years' service, who had never been censured, should not be held to blame.

Having galloped safely through the French, he reached a field behind the copse across which our men, regardless of orders, were running and descending the valley. That moment of moral hesitation which decides the fate of battles had arrived. Would this disorderly crowd of soldiers attend to the voice of their commander, or would they, disregarding him, continue their flight? Despite his desperate shouts that used to seem so terrible to the soldiers, despite his furious purple countenance distorted out of all likeness to his former self, and the flourishing of his saber, the soldiers all continued to run, talking, firing into the air, and disobeying orders. The moral hesitation which decided the fate of battles was evidently culminating in a panic.

The general had a fit of coughing as a result of shouting and of the powder smoke and stopped in despair. Everything seemed lost. But at that moment the French who were attacking, suddenly and without any apparent reason, ran back and disappeared from the outskirts, and Russian sharpshooters showed themselves in the copse. It was Timokhin's company, which alone had maintained its order in the wood and, having lain in ambush in a ditch, now attacked the French unexpectedly. Timokhin, armed only with a sword, had rushed at the enemy with such a desperate cry and such mad, drunken determination that, taken by surprise, the French had thrown down their muskets and run. Dolokhov, running beside Timokhin, killed a Frenchman at close quarters and was the first to seize the surrendering French officer by his collar. Our fugitives returned, the battalions re-formed, and the French who had nearly cut our left flank in half were for the moment repulsed. Our reserve units were able to join up, and the fight was at an end. The regimental commander and Major Ekonomov had stopped beside a bridge, letting the retreating companies pass by them, when a soldier came up and took hold of the commander's stirrup, almost leaning against him. The man was wearing a bluish coat of broadcloth, he had no knapsack or cap, his head was bandaged, and over his shoulder a French munition pouch was slung. He had an officer's sword in his hand. The soldier was pale, his blue eyes looked impudently into the commander's face, and his lips were smiling. Though the commander was occupied in giving instructions to Major Ekonomov, he could not help taking notice of the soldier.

"Your excellency, here are two trophies," said Dolokhov, pointing to the French sword and pouch. "I have taken an officer prisoner. I stopped the company." Dolokhov breathed heavily from weariness and spoke in abrupt sentences. "The whole company can bear witness. I beg you will remember this, your excellency!"

"All right, all right," replied the commander, and turned to Major

Ekonomov.

But Dolokhov did not go away; he untied the handkerchief around his head, pulled it off, and showed the blood congealed on his hair.

"A bayonet wound. I remained at the front. Remember, your excellency!"

Tushin's battery had been forgotten and only at the very end of the action did Prince Bagration, still hearing the cannonade in the center, send his orderly staff officer, and later Prince Andrew also, to order the battery to retire as quickly as possible. When the supports attached to Tushin's battery had been moved away in the middle of the action by someone's order, the battery had continued firing and was only not captured by the French because the enemy could not surmise that anyone could have the effrontery to continue firing from four quite undefended guns. On the contrary, the energetic action of that battery led the French to suppose that here--in the center--the main Russian forces were concentrated. Twice they had attempted to attack this point, but on each occasion had been driven back by grapeshot from the four isolated guns on the hillock.

Soon after Prince Bagration had left him, Tushin had succeeded in setting fire to Schon Grabern.

"Look at them scurrying! It's burning! Just see the smoke! Fine! Grand! Look at the smoke, the smoke!" exclaimed the artillerymen, brightening up.

All the guns, without waiting for orders, were being fired in the direction of the conflagration. As if urging each other on, the soldiers cried at each shot: "Fine! That's good! Look at it... Grand!" The fire, fanned by the breeze, was rapidly spreading. The French columns that had advanced beyond the village went back; but as though in revenge for this failure, the enemy placed ten guns to the right of the village and began firing them at Tushin's battery.

In their childlike glee, aroused by the fire and their luck in successfully cannonading the French, our artillerymen only noticed this battery when two balls, and then four more, fell among our guns, one knocking over two horses and another tearing off a munition-wagon driver's leg. Their spirits once roused were, however, not diminished, but only changed character. The horses were replaced by others from a reserve gun carriage, the wounded were carried away, and the four guns were turned against the ten-gun battery. Tushin's companion officer had been killed at the beginning of the engagement and within an hour seventeen of the forty men of the guns' crews had been disabled, but the artillerymen were still as merry and lively as ever. Twice they noticed the French appearing below them, and then they fired grapeshot at them.

Little Tushin, moving feebly and awkwardly, kept telling his orderly to "refill my pipe for that one!" and then, scattering sparks from it, ran forward shading his eyes with his small hand to look at the French.

"Smack at 'em, lads!" he kept saying, seizing the guns by the wheels and working the screws himself.

Amid the smoke, deafened by the incessant reports which always made him jump, Tushin not taking his pipe from his mouth ran from gun to gun, now aiming, now counting the charges, now giving orders about replacing dead or wounded horses and harnessing fresh ones, and shouting in his feeble voice, so high pitched and irresolute. His face grew more and more animated. Only when a man was killed or wounded did he frown and turn away from the sight, shouting angrily at the men who, as is always the case, hesitated about lifting the injured or dead. The soldiers, for the most part handsome fellows and, as is always the case in an artillery company, a head and shoulders

taller and twice as broad as their officer--all looked at their commander like children in an embarrassing situation, and the expression on his face was invariably reflected on theirs.

Owing to the terrible uproar and the necessity for concentration and activity, Tushin did not experience the slightest unpleasant sense of fear, and the thought that he might be killed or badly wounded never occurred to him. On the contrary, he became more and more elated. It seemed to him that it was a very long time ago, almost a day, since he had first seen the enemy and fired the first shot, and that the corner of the field he stood on was well-known and familiar ground. Though he thought of everything, considered everything, and did everything the best of officers could do in his position, he was in a state akin to feverish delirium or drunkenness.

From the deafening sounds of his own guns around him, the whistle and thud of the enemy's cannon balls, from the flushed and perspiring faces of the crew bustling round the guns, from the sight of the blood of men and horses, from the little puffs of smoke on the enemy's side (always followed by a ball flying past and striking the earth, a man, a gun, a horse), from the sight of all these things a fantastic world of his own had taken possession of his brain and at that moment afforded him pleasure. The enemy's guns were in his fancy not guns but pipes from which occasional puffs were blown by an invisible smoker.

"There... he's puffing again," muttered Tushin to himself, as a small cloud rose from the hill and was borne in a streak to the left by the wind.

"Now look out for the ball... we'll throw it back."

"What do you want, your honor?" asked an artilleryman, standing close by, who heard him muttering.

"Nothing... only a shell..." he answered.

"Come along, our Matvevna!" he said to himself. "Matvevna"* was the name his fancy gave to the farthest gun of the battery, which was large and of an old pattern. The French swarming round their guns seemed to him like ants. In that world, the handsome drunkard Number One of the second gun's crew was "uncle"; Tushin looked at him more often than at anyone else and took delight in his every movement. The sound of musketry at the foot of the hill, now diminishing, now increasing, seemed like someone's breathing. He listened intently to the ebb and flow of these sounds.

*Daughter of Matthew.

"Ah! Breathing again, breathing!" he muttered to himself.

He imagined himself as an enormously tall, powerful man who was throwing cannon balls at the French with both hands.

"Now then, Matvevna, dear old lady, don't let me down!" he was saying as he moved from the gun, when a strange, unfamiliar voice called above his head: "Captain Tushin! Captain!"

Tushin turned round in dismay. It was the staff officer who had turned him out of the booth at Grunth. He was shouting in a gasping voice:

"Are you mad? You have twice been ordered to retreat, and you..."

"Why are they down on me?" thought Tushin, looking in alarm at his superior.

"I... don't..." he muttered, holding up two fingers to his cap.

"I..."

But the staff officer did not finish what he wanted to say. A cannon ball, flying close to him, caused him to duck and bend over his horse. He paused, and just as he was about to say something more, another ball stopped him. He turned his horse and galloped off.

"Retire! All to retire!" he shouted from a distance.

The soldiers laughed. A moment later, an adjutant arrived with the same order.

It was Prince Andrew. The first thing he saw on riding up to the space where Tushin's guns were stationed was an unharnessed horse with a broken leg, that lay screaming piteously beside the harnessed horses. Blood was gushing from its leg as from a spring. Among the limbers lay several dead men. One ball after another passed over as he approached and he felt a nervous shudder run down his spine. But the mere thought of being afraid roused him again. "I cannot be afraid," thought he, and dismounted slowly among the guns. He delivered the order and did not leave the battery. He decided to have the guns removed from their positions and withdrawn in his presence. Together with Tushin, stepping across the bodies and under a terrible fire from the French, he attended to the removal of the guns.

"A staff officer was here a minute ago, but skipped off," said an artilleryman to Prince Andrew. "Not like your honor!"

Prince Andrew said nothing to Tushin. They were both so busy as to seem not to notice one another. When having limbered up the only two cannon that remained uninjured out of the four, they began moving down the hill (one shattered gun and one unicorn were left behind), Prince Andrew rode up to Tushin.

"Well, till we meet again..." he said, holding out his hand to Tushin.

"Good-by, my dear fellow," said Tushin. "Dear soul! Good-by, my dear fellow!" and for some unknown reason tears suddenly filled his eyes.

CHAPTER XXI

The wind had fallen and black clouds, merging with the powder smoke, hung low over the field of battle on the horizon. It was growing dark and the glow of two conflagrations was the more conspicuous. The cannonade was dying down, but the rattle of musketry behind and on the right sounded oftener and nearer. As soon as Tushin with his guns, continually driving round or coming upon wounded men, was out of range of fire and had descended into the dip, he was met by some of the staff, among them the staff officer and Zherkov, who had been twice sent to Tushin's battery but had never reached it. Interrupting one another, they all gave, and transmitted, orders as to how to proceed, reprimanding and reproaching him. Tushin gave no orders, and, silently--fearing to speak because at every word he felt ready to weep without knowing why--rode behind on his artillery nag. Though the orders were to abandon the wounded, many of them dragged themselves after troops and begged for seats on the gun carriages. The jaunty infantry officer who just before the battle had rushed out of Tushin's wattle shed was laid, with a bullet in his stomach, on "Matvevna's" carriage. At the foot of the hill, a pale hussar cadet, supporting one hand with the other, came up to Tushin and asked for a seat.

"Captain, for God's sake! I've hurt my arm," he said timidly. "For God's sake... I can't walk. For God's sake!"

It was plain that this cadet had already repeatedly asked for a lift and been refused. He asked in a hesitating, piteous voice.

"Tell them to give me a seat, for God's sake!"

"Give him a seat," said Tushin. "Lay a cloak for him to sit on, lad," he said, addressing his favorite soldier. "And where is the wounded officer?"

"He has been set down. He died," replied someone.

"Help him up. Sit down, dear fellow, sit down! Spread out the cloak, Antonov."

The cadet was Rostov. With one hand he supported the other; he was pale and his jaw trembled, shivering feverishly. He was placed on "Matvevna," the gun from which they had removed the dead officer. The cloak they spread under him was wet with blood which stained his breeches and arm.

"What, are you wounded, my lad?" said Tushin, approaching the gun on which Rostov sat.

"No, it's a sprain."

"Then what is this blood on the gun carriage?" inquired Tushin.

"It was the officer, your honor, stained it," answered the artilleryman, wiping away the blood with his coat sleeve, as if apologizing for the state of his gun.

It was all that they could do to get the guns up the rise aided by the infantry, and having reached the village of Gruntendorf they halted. It had grown so dark that one could not distinguish the uniforms ten paces off, and the firing had begun to subside. Suddenly, near by on the right, shouting and firing were again heard. Flashes of shot gleamed in the darkness. This was the last French attack and was met by soldiers who had sheltered in the village houses. They all rushed out of the village again, but Tushin's guns could not move, and the artillerymen, Tushin, and the cadet exchanged silent glances as they awaited their fate. The firing died down and soldiers, talking eagerly, streamed out of a side street.

"Not hurt, Petrov?" asked one.

"We've given it 'em hot, mate! They won't make another push now," said another.

"You couldn't see a thing. How they shot at their own fellows! Nothing could be seen. Pitch-dark, brother! Isn't there something to drink?"

The French had been repulsed for the last time. And again and again in the complete darkness Tushin's guns moved forward, surrounded by the humming infantry as by a frame.

In the darkness, it seemed as though a gloomy unseen river was flowing always in one direction, humming with whispers and talk and the sound of hoofs and wheels. Amid the general rumble, the groans and voices of the wounded were more distinctly heard than any other sound in the darkness of the night. The gloom that enveloped the army was filled with their groans, which seemed to melt into one with the darkness of the night. After a while the moving mass became agitated, someone rode past on a white horse followed by his suite, and said something in passing: "What did he say? Where to, now? Halt, is it? Did he thank us?" came eager questions from all sides. The whole moving mass began pressing closer together and a report spread that they were ordered to halt: evidently those in front had halted. All remained where they were in the middle of the muddy road.

Fires were lighted and the talk became more audible. Captain Tushin, having given orders to his company, sent a soldier to find a dressing station or a doctor for the cadet, and sat down by a bonfire the soldiers had kindled on the road. Rostov, too, dragged himself to the fire. From pain, cold, and damp, a feverish shivering shook his whole body. Drowsiness was irresistibly mastering him, but he kept awake by an excruciating pain in his arm, for which he could find no satisfactory position. He kept closing his eyes and then again looking at the fire, which seemed to him dazzlingly red, and at the feeble, round-shouldered figure of Tushin who was sitting cross-legged like a Turk beside him. Tushin's large, kind, intelligent eyes were fixed with sympathy and commiseration on Rostov, who saw that Tushin with his whole heart wished to help him but could not.

From all sides were heard the footsteps and talk of the infantry, who were walking, driving past, and settling down all around. The sound of voices, the tramping feet, the horses' hoofs moving in mud, the crackling of wood fires near and afar, merged into one tremulous rumble.

It was no longer, as before, a dark, unseen river flowing through the gloom, but a dark sea swelling and gradually subsiding after a storm. Rostov looked at and listened listlessly to what passed before and around him. An infantryman came to the fire, squatted on his heels, held his hands to the blaze, and turned away his face.

"You don't mind your honor?" he asked Tushin. "I've lost my company, your honor. I don't know where... such bad luck!"

With the soldier, an infantry officer with a bandaged cheek came up to the bonfire, and addressing Tushin asked him to have the guns moved a trifle to let a wagon go past. After he had gone, two soldiers rushed to the campfire. They were quarreling and fighting desperately, each trying to snatch from the other a boot they were both holding on to.

"You picked it up?... I dare say! You're very smart!" one of them shouted hoarsely.

Then a thin, pale soldier, his neck bandaged with a bloodstained leg band, came up and in angry tones asked the artillerymen for water.

"Must one die like a dog?" said he.

Tushin told them to give the man some water. Then a cheerful soldier ran up, begging a little fire for the infantry.

"A nice little hot torch for the infantry! Good luck to you, fellow countrymen. Thanks for the fire--we'll return it with interest," said he, carrying away into the darkness a glowing stick.

Next came four soldiers, carrying something heavy on a cloak, and passed by the fire. One of them stumbled.

"Who the devil has put the logs on the road?" snarled he.

"He's dead--why carry him?" said another.

"Shut up!"

And they disappeared into the darkness with their load.

"Still aching?" Tushin asked Rostov in a whisper.

"Yes."

"Your honor, you're wanted by the general. He is in the hut here," said a gunner, coming up to Tushin.

"Coming, friend."

Tushin rose and, buttoning his greatcoat and pulling it straight, walked away from the fire.

Not far from the artillery campfire, in a hut that had been prepared for him, Prince Bagration sat at dinner, talking with some commanding officers who had gathered at his quarters. The little old man with the half-closed eyes was there greedily gnawing a mutton bone, and the general who had served blamelessly for twenty-two years, flushed by a glass of vodka and the dinner; and the staff officer with the signet ring, and Zherkov, uneasily glancing at them all, and Prince Andrew, pale, with compressed lips and feverishly glittering eyes.

In a corner of the hut stood a standard captured from the French, and the accountant with the naive face was feeling its texture, shaking his head in perplexity--perhaps because the banner really interested him, perhaps because it was hard for him, hungry as he was, to look on at a dinner where there was no place for him. In the next hut there was a French colonel who had been taken prisoner by our dragoons. Our officers were flocking in to look at him. Prince Bagration was thanking the individual commanders and inquiring into details of the action and our losses. The general whose regiment had been inspected at Braunau was informing the prince that as soon as the action began he had withdrawn from the wood, mustered the men who were woodcutting, and, allowing the French to pass him, had made a bayonet charge with two battalions and had broken up the French troops.

"When I saw, your excellency, that their first battalion was disorganized, I stopped in the road and thought: 'I'll let them come on and will meet them with the fire of the whole battalion'--and that's what I did."

The general had so wished to do this and was so sorry he had not managed to do it that it seemed to him as if it had really happened. Perhaps it might really have been so? Could one possibly make out amid all that confusion what did or did not happen?

"By the way, your excellency, I should inform you," he continued--remembering Dolokhov's conversation with Kutuzov and his last interview with the gentleman-ranker--"that Private Dolokhov, who was reduced to the ranks, took a French officer prisoner in my presence and particularly distinguished himself."

"I saw the Pavlograd hussars attack there, your excellency," chimed in Zherkov, looking uneasily around. He had not seen the hussars all that day, but had heard about them from an infantry officer. "They broke up two squares, your excellency."

Several of those present smiled at Zherkov's words, expecting one of his usual jokes, but noticing that what he was saying redounded to the glory of our arms and of the day's work, they assumed a serious expression, though many of them knew that what he was saying was a lie devoid of any foundation. Prince Bagration turned to the old colonel:

"Gentlemen, I thank you all; all arms have behaved heroically: infantry, cavalry, and artillery. How was it that two guns were abandoned in the center?" he inquired, searching with his eyes for someone. (Prince Bagration did not ask about the guns on the left flank; he knew that all the guns there had been abandoned at the very beginning of the action.) "I think I sent you?" he added, turning to the staff officer on duty.

"One was damaged," answered the staff officer, "and the other I can't understand. I was there all the time giving orders and had only just left.... It is true that it was hot there," he added, modestly.

Someone mentioned that Captain Tushin was bivouacking close to the

village and had already been sent for.

"Oh, but you were there?" said Prince Bagration, addressing Prince Andrew.

"Of course, we only just missed one another," said the staff officer, with a smile to Bolkonski.

"I had not the pleasure of seeing you," said Prince Andrew, coldly and abruptly.

All were silent. Tushin appeared at the threshold and made his way timidly from behind the backs of the generals. As he stepped past the generals in the crowded hut, feeling embarrassed as he always was by the sight of his superiors, he did not notice the staff of the banner and stumbled over it. Several of those present laughed.

"How was it a gun was abandoned?" asked Bagration, frowning, not so much at the captain as at those who were laughing, among whom Zherkov laughed loudest.

Only now, when he was confronted by the stern authorities, did his guilt and the disgrace of having lost two guns and yet remaining alive present themselves to Tushin in all their horror. He had been so excited that he had not thought about it until that moment. The officers' laughter confused him still more. He stood before Bagration with his lower jaw trembling and was hardly able to mutter: "I don't know... your excellency... I had no men... your excellency."

"You might have taken some from the covering troops."

Tushin did not say that there were no covering troops, though that was perfectly true. He was afraid of getting some other officer into trouble, and silently fixed his eyes on Bagration as a schoolboy who has blundered looks at an examiner.

The silence lasted some time. Prince Bagration, apparently not wishing to be severe, found nothing to say; the others did not venture to intervene. Prince Andrew looked at Tushin from under his brows and his fingers twitched nervously.

"Your excellency!" Prince Andrew broke the silence with his abrupt voice, "you were pleased to send me to Captain Tushin's battery. I went there and found two thirds of the men and horses knocked out, two guns smashed, and no supports at all."

Prince Bagration and Tushin looked with equal intentness at Bolkonski, who spoke with suppressed agitation.

"And, if your excellency will allow me to express my opinion," he continued, "we owe today's success chiefly to the action of that battery and the heroic endurance of Captain Tushin and his company," and without awaiting a reply, Prince Andrew rose and left the table.

Prince Bagration looked at Tushin, evidently reluctant to show distrust in Bolkonski's emphatic opinion yet not feeling able fully to credit it, bent his head, and told Tushin that he could go. Prince Andrew went out with him.

"Thank you; you saved me, my dear fellow!" said Tushin.

Prince Andrew gave him a look, but said nothing and went away. He felt sad and depressed. It was all so strange, so unlike what he had hoped.

"Who are they? Why are they here? What do they want? And when will all this end?" thought Rostov, looking at the changing shadows before him. The pain in his arm became more and more intense.

Irresistible drowsiness overpowered him, red rings danced before his eyes, and the impression of those voices and faces and a sense of loneliness merged with the physical pain. It was they, these soldiers-wounded and unwounded--it was they who were crushing, weighing down, and twisting the sinews and scorching the flesh of his sprained arm and shoulder. To rid himself of them he closed his eyes.

For a moment he dozed, but in that short interval innumerable things appeared to him in a dream: his mother and her large white hand, Sonya's thin little shoulders, Natasha's eyes and laughter, Denisov with his voice and mustache, and Telyanin and all that affair with Telyanin and Bogdanich. That affair was the same thing as this soldier with the harsh voice, and it was that affair and this soldier that were so agonizingly, incessantly pulling and pressing his arm and always dragging it in one direction. He tried to get away from them, but they would not for an instant let his shoulder move a hair's breadth. It would not ache--it would be well--if only they did not pull it, but it was impossible to get rid of them.

He opened his eyes and looked up. The black canopy of night hung less than a yard above the glow of the charcoal. Flakes of falling snow were fluttering in that light. Tushin had not returned, the doctor had not come. He was alone now, except for a soldier who was sitting naked at the other side of the fire, warming his thin yellow body.

"Nobody wants me!" thought Rostov. "There is no one to help me or pity me. Yet I was once at home, strong, happy, and loved." He sighed and, doing so, groaned involuntarily.

"Eh, is anything hurting you?" asked the soldier, shaking his shirt out over the fire, and not waiting for an answer he gave a grunt and added: "What a lot of men have been crippled today--frightful!"

Rostov did not listen to the soldier. He looked at the snowflakes fluttering above the fire and remembered a Russian winter at his warm, bright home, his fluffy fur coat, his quickly gliding sleigh, his healthy body, and all the affection and care of his family. "And why did I come here?" he wondered.

Next day the French army did not renew their attack, and the remnant of Bagration's detachment was reunited to Kutuzov's army.

BOOK THREE: 1805

CHAPTER I

Prince Vasili was not a man who deliberately thought out his plans. Still less did he think of injuring anyone for his own advantage. He was merely a man of the world who had got on and to whom getting on had become a habit. Schemes and devices for which he never rightly accounted to himself, but which formed the whole interest of his life, were constantly shaping themselves in his mind, arising from the circumstances and persons he met. Of these plans he had not merely one or two in his head but dozens, some only beginning to form themselves, some approaching achievement, and some in course of disintegration. He did not, for instance, say to himself: "This man now has influence, I must gain his confidence and friendship and through him obtain a special grant." Nor did he say to himself: "Pierre is a rich man, I must entice him to marry my daughter and lend me the forty thousand rubles I need." But when he came across a man of position his instinct immediately told him that this

man could be useful, and without any premeditation Prince Vasili took the first opportunity to gain his confidence, flatter him, become intimate with him, and finally make his request.

He had Pierre at hand in Moscow and procured for him an appointment as Gentleman of the Bedchamber, which at that time conferred the status of Councilor of State, and insisted on the young man accompanying him to Petersburg and staying at his house. With apparent absent-mindedness, yet with unhesitating assurance that he was doing the right thing, Prince Vasili did everything to get Pierre to marry his daughter. Had he thought out his plans beforehand he could not have been so natural and shown such unaffected familiarity in intercourse with everybody both above and below him in social standing. Something always drew him toward those richer and more powerful than himself and he had rare skill in seizing the most opportune moment for making use of people.

Pierre, on unexpectedly becoming Count Bezukhov and a rich man, felt himself after his recent loneliness and freedom from cares so beset and preoccupied that only in bed was he able to be by himself. He had to sign papers, to present himself at government offices, the purpose of which was not clear to him, to question his chief steward, to visit his estate near Moscow, and to receive many people who formerly did not even wish to know of his existence but would now have been offended and grieved had he chosen not to see them. These different people--businessmen, relations, and acquaintances alike--were all disposed to treat the young heir in the most friendly and flattering manner: they were all evidently firmly convinced of Pierre's noble qualities. He was always hearing such words as: "With your remarkable kindness," or, "With your excellent heart," "You are yourself so honorable Count," or, "Were he as clever as you," and so on, till he began sincerely to believe in his own exceptional kindness and extraordinary intelligence, the more so as in the depth of his heart it had always seemed to him that he really was very kind and intelligent. Even people who had formerly been spiteful toward him and evidently unfriendly now became gentle and affectionate. The angry eldest princess, with the long waist and hair plastered down like a doll's, had come into Pierre's room after the funeral. With drooping eyes and frequent blushes she told him she was very sorry about their past misunderstandings and did not now feel she had a right to ask him for anything, except only for permission, after the blow she had received, to remain for a few weeks longer in the house she so loved and where she had sacrificed so much. She could not refrain from weeping at these words. Touched that this statuesque princess could so change, Pierre took her hand and begged her forgiveness, without knowing what for. From that day the eldest princess quite changed toward Pierre and began knitting a striped scarf for him.

"Do this for my sake, mon cher; after all, she had to put up with a great deal from the deceased," said Prince Vasili to him, handing him a deed to sign for the princess' benefit.

Prince Vasili had come to the conclusion that it was necessary to throw this bone--a bill for thirty thousand rubles--to the poor princess that it might not occur to her to speak of his share in the affair of the inlaid portfolio. Pierre signed the deed and after that the princess grew still kinder. The younger sisters also became affectionate to him, especially the youngest, the pretty one with the mole, who often made him feel confused by her smiles and her own confusion when meeting him.

It seemed so natural to Pierre that everyone should like him, and it would have seemed so unnatural had anyone disliked him, that he could not but believe in the sincerity of those around him. Besides, he had no time to ask himself whether these people were sincere or not. He was always busy and always felt in a state of mild and cheerful intoxication. He felt as though he were the center of some important and general movement; that something was constantly expected of him, that if he did not do it he would grieve and disappoint many

people, but if he did this and that, all would be well; and he did what was demanded of him, but still that happy result always remained in the future.

More than anyone else, Prince Vasili took possession of Pierre's affairs and of Pierre himself in those early days. From the death of Count Bezukhov he did not let go his hold of the lad. He had the air of a man oppressed by business, weary and suffering, who yet would not, for pity's sake, leave this helpless youth who, after all, was the son of his old friend and the possessor of such enormous wealth, to the caprice of fate and the designs of rogues. During the few days he spent in Moscow after the death of Count Bezukhov, he would call Pierre, or go to him himself, and tell him what ought to be done in a tone of weariness and assurance, as if he were adding every time: "You know I am overwhelmed with business and it is purely out of charity that I trouble myself about you, and you also know quite well that what I propose is the only thing possible."

"Well, my dear fellow, tomorrow we are off at last," said Prince Vasili one day, closing his eyes and fingering Pierre's elbow, speaking as if he were saying something which had long since been agreed upon and could not now be altered. "We start tomorrow and I'm giving you a place in my carriage. I am very glad. All our important business here is now settled, and I ought to have been off long ago. Here is something I have received from the chancellor. I asked him for you, and you have been entered in the diplomatic corps and made a Gentleman of the Bedchamber. The diplomatic career now lies open before you."

Notwithstanding the tone of wearied assurance with which these words were pronounced, Pierre, who had so long been considering his career, wished to make some suggestion. But Prince Vasili interrupted him in the special deep cooing tone, precluding the possibility of interrupting his speech, which he used in extreme cases when special persuasion was needed.

"Mais, mon cher, I did this for my own sake, to satisfy my conscience, and there is nothing to thank me for. No one has ever complained yet of being too much loved; and besides, you are free, you could throw it up tomorrow. But you will see everything for yourself when you get to Petersburg. It is high time for you to get away from these terrible recollections." Prince Vasili sighed. "Yes, yes, my boy. And my valet can go in your carriage. Ah! I was nearly forgetting," he added. "You know, mon cher, your father and I had some accounts to settle, so I have received what was due from the Ryazan estate and will keep it; you won't require it. We'll go into the accounts later."

By "what was due from the Ryazan estate" Prince Vasili meant several thousand rubles quitrent received from Pierre's peasants, which the prince had retained for himself.

In Petersburg, as in Moscow, Pierre found the same atmosphere of gentleness and affection. He could not refuse the post, or rather the rank (for he did nothing), that Prince Vasili had procured for him, and acquaintances, invitations, and social occupations were so numerous that, even more than in Moscow, he felt a sense of bewilderment, bustle, and continual expectation of some good, always in front of him but never attained.

Of his former bachelor acquaintances many were no longer in Petersburg. The Guards had gone to the front; Dolokhov had been reduced to the ranks; Anatole was in the army somewhere in the provinces; Prince Andrew was abroad; so Pierre had not the opportunity to spend his nights as he used to like to spend them, or to open his mind by intimate talks with a friend older than himself and whom he respected. His whole time was taken up with dinners and balls and was spent chiefly at Prince Vasili's house in the company of the stout princess, his wife, and his beautiful daughter Helene.

Like the others, Anna Pavlovna Scherer showed Pierre the change of attitude toward him that had taken place in society.

Formerly in Anna Pavlovna's presence, Pierre had always felt that what he was saying was out of place, tactless and unsuitable, that remarks which seemed to him clever while they formed in his mind became foolish as soon as he uttered them, while on the contrary Hippolyte's stupidest remarks came out clever and apt. Now everything Pierre said was charmant. Even if Anna Pavlovna did not say so, he could see that she wished to and only refrained out of regard for his modesty.

In the beginning of the winter of 1805-6 Pierre received one of Anna Pavlovna's usual pink notes with an invitation to which was added: "You will find the beautiful Helene here, whom it is always delightful to see."

When he read that sentence, Pierre felt for the first time that some link which other people recognized had grown up between himself and Helene, and that thought both alarmed him, as if some obligation were being imposed on him which he could not fulfill, and pleased him as an entertaining supposition.

Anna Pavlovna's "At Home" was like the former one, only the novelty she offered her guests this time was not Mortemart, but a diplomatist fresh from Berlin with the very latest details of the Emperor Alexander's visit to Potsdam, and of how the two august friends had pledged themselves in an indissoluble alliance to uphold the cause of justice against the enemy of the human race. Anna Pavlovna received Pierre with a shade of melancholy, evidently relating to the young man's recent loss by the death of Count Bezukhov (everyone constantly considered it a duty to assure Pierre that he was greatly afflicted by the death of the father he had hardly known), and her melancholy was just like the august melancholy she showed at the mention of her most august Majesty the Empress Marya Fedorovna. Pierre felt flattered by this. Anna Pavlovna arranged the different groups in her drawing room with her habitual skill. The large group, in which were Prince Vasili and the generals, had the benefit of the diplomat. Another group was at the tea table. Pierre wished to join the former, but Anna Pavlovna--who was in the excited condition of a commander on a battlefield to whom thousands of new and brilliant ideas occur which there is hardly time to put in action--seeing Pierre, touched his sleeve with her finger, saying:

"Wait a bit, I have something in view for you this evening." (She glanced at Helene and smiled at her.) "My dear Helene, be charitable to my poor aunt who adores you. Go and keep her company for ten minutes. And that it will not be too dull, here is the dear count who will not refuse to accompany you."

The beauty went to the aunt, but Anna Pavlovna detained Pierre, looking as if she had to give some final necessary instructions.

"Isn't she exquisite?" she said to Pierre, pointing to the stately beauty as she glided away. "And how she carries herself! For so young a girl, such tact, such masterly perfection of manner! It comes from her heart. Happy the man who wins her! With her the least worldly of men would occupy a most brilliant position in society. Don't you think so? I only wanted to know your opinion," and Anna Pavlovna let Pierre go.

Pierre, in reply, sincerely agreed with her as to Helene's perfection of manner. If he ever thought of Helene, it was just of her beauty and her remarkable skill in appearing silently dignified in society.

The old aunt received the two young people in her corner, but seemed desirous of hiding her adoration for Helene and inclined rather to show her fear of Anna Pavlovna. She looked at her niece, as if inquiring what she was to do with these people. On leaving them,

Anna Pavlovna again touched Pierre's sleeve, saying: "I hope you won't say that it is dull in my house again," and she glanced at Helene.

Helene smiled, with a look implying that she did not admit the possibility of anyone seeing her without being enchanted. The aunt coughed, swallowed, and said in French that she was very pleased to see Helene, then she turned to Pierre with the same words of welcome and the same look. In the middle of a dull and halting conversation, Helene turned to Pierre with the beautiful bright smile that she gave to everyone. Pierre was so used to that smile, and it had so little meaning for him, that he paid no attention to it. The aunt was just speaking of a collection of snuffboxes that had belonged to Pierre's father, Count Bezukhov, and showed them her own box. Princess Helene asked to see the portrait of the aunt's husband on the box lid.

"That is probably the work of Vinesse," said Pierre, mentioning a celebrated miniaturist, and he leaned over the table to take the snuffbox while trying to hear what was being said at the other table.

He half rose, meaning to go round, but the aunt handed him the snuffbox, passing it across Helene's back. Helene stooped forward to make room, and looked round with a smile. She was, as always at evening parties, wearing a dress such as was then fashionable, cut very low at front and back. Her bust, which had always seemed like marble to Pierre, was so close to him that his shortsighted eyes could not but perceive the living charm of her neck and shoulders, so near to his lips that he need only have bent his head a little to have touched them. He was conscious of the warmth of her body, the scent of perfume, and the creaking of her corset as she moved. He did not see her marble beauty forming a complete whole with her dress, but all the charm of her body only covered by her garments. And having once seen this he could not help being aware it, just as we cannot renew an illusion we have once seen through.

"So you have never noticed before how beautiful I am?" Helene seemed to say. "You had not noticed that I am a woman? Yes, I am a woman who may belong to anyone--to you too," said her glance. And at that moment Pierre felt that Helene not only could, but must, be his wife, and that it could not be otherwise.

He knew this at that moment as surely as if he had been standing at the altar with her. How and when this would be he did not know, he did not even know if it would be a good thing (he even felt, he knew not why, that it would be a bad thing), but he knew it would happen.

Pierre dropped his eyes, lifted them again, and wished once more to see her as a distant beauty far removed from him, as he had seen her every day until then, but he could no longer do it. He could not, any more than a man who has been looking at a tuft of steppe grass through the mist and taking it for a tree can again take it for a tree after he has once recognized it to be a tuft of grass. She was terribly close to him. She already had power over him, and between them there was no longer any barrier except the barrier of his own will.

"Well, I will leave you in your little corner," came Anna Pavlovna's voice, "I see you are all right there."

And Pierre, anxiously trying to remember whether he had done anything reprehensible, looked round with a blush. It seemed to him that everyone knew what had happened to him as he knew it himself.

A little later when he went up to the large circle, Anna Pavlovna said to him: "I hear you are refitting your Petersburg house?"

This was true. The architect had told him that it was necessary, and Pierre, without knowing why, was having his enormous Petersburg house done up.

"That's a good thing, but don't move from Prince Vasili's. It is good to have a friend like the prince," she said, smiling at Prince Vasili. "I know something about that. Don't I? And you are still so young. You need advice. Don't be angry with me for exercising an old woman's privilege."

She paused, as women always do, expecting something after they have mentioned their age. "If you marry it will be a different thing," she continued, uniting them both in one glance. Pierre did not look at Helene nor she at him. But she was just as terribly close to him. He muttered something and colored.

When he got home he could not sleep for a long time for thinking of what had happened. What had happened? Nothing. He had merely understood that the woman he had known as a child, of whom when her beauty was mentioned he had said absent-mindedly: "Yes, she's good looking," he had understood that this woman might belong to him.

"But she's stupid. I have myself said she is stupid," he thought. "There is something nasty, something wrong, in the feeling she excites in me. I have been told that her brother Anatole was in love with her and she with him, that there was quite a scandal and that that's why he was sent away. Hippolyte is her brother... Prince Vasili is her father... It's bad...." he reflected, but while he was thinking this (the reflection was still incomplete), he caught himself smiling and was conscious that another line of thought had sprung up, and while thinking of her worthlessness he was also dreaming of how she would be his wife, how she would love him become quite different, and how all he had thought and heard of her might be false. And he again saw her not as the daughter of Prince Vasili, but visualized her whole body only veiled by its gray dress. "But no! Why did this thought never occur to me before?" and again he told himself that it was impossible, that there would be something unnatural, and as it seemed to him dishonorable, in this marriage. He recalled her former words and looks and the words and looks of those who had seen them together. He recalled Anna Pavlovna's words and looks when she spoke to him about his house, recalled thousands of such hints from Prince Vasili and others, and was seized by terror lest he had already, in some way, bound himself to do something that was evidently wrong and that he ought not to do. But at the very time he was expressing this conviction to himself, in another part of his mind her image rose in all its womanly beauty.

CHAPTER II

In November, 1805, Prince Vasili had to go on a tour of inspection in four different provinces. He had arranged this for himself so as to visit his neglected estates at the same time and pick up his son Anatole where his regiment was stationed, and take him to visit Prince Nicholas Bolkonski in order to arrange a match for him with the daughter of that rich old man. But before leaving home and undertaking these new affairs, Prince Vasili had to settle matters with Pierre, who, it is true, had latterly spent whole days at home, that is, in Prince Vasili's house where he was staying, and had been absurd, excited, and foolish in Helene's presence (as a lover should be), but had not yet proposed to her.

"This is all very fine, but things must be settled," said Prince Vasili to himself, with a sorrowful sigh, one morning, feeling that Pierre who was under such obligations to him ("But never mind that") was not behaving very well in this matter. "Youth, frivolity... well, God be with him," thought he, relishing his own goodness of heart, "but it must be brought to a head. The day after tomorrow will be Lelya's name day. I will invite two or three people, and if he does not understand what he ought to do then it will be my affair—yes, my affair. I am her father."

Six weeks after Anna Pavlovna's "At Home" and after the sleepless night when he had decided that to marry Helene would be a calamity and that he ought to avoid her and go away, Pierre, despite that decision, had not left Prince Vasili's and felt with terror that in people's eyes he was every day more and more connected with her, that it was impossible for him to return to his former conception of her, that he could not break away from her, and that though it would be a terrible thing he would have to unite his fate with hers. He might perhaps have been able to free himself but that Prince Vasili (who had rarely before given receptions) now hardly let a day go by without having an evening party at which Pierre had to be present unless he wished to spoil the general pleasure and disappoint everyone's expectation. Prince Vasili, in the rare moments when he was at home, would take Pierre's hand in passing and draw it downwards, or absent-mindedly hold out his wrinkled, clean-shaven cheek for Pierre to kiss and would say: "Till tomorrow," or, "Be in to dinner or I shall not see you," or, "I am staying in for your sake," and so on. And though Prince Vasili, when he stayed in (as he said) for Pierre's sake, hardly exchanged a couple of words with him, Pierre felt unable to disappoint him. Every day he said to himself one and the same thing: "It is time I understood her and made up my mind what she really is. Was I mistaken before, or am I mistaken now? No, she is not stupid, she is an excellent girl," he sometimes said to himself "she never makes a mistake, never says anything stupid. She says little, but what she does say is always clear and simple, so she is not stupid. She never was abashed and is not abashed now, so she cannot be a bad woman!" He had often begun to make reflections or think aloud in her company, and she had always answered him either by a brief but appropriate remark--showing that it did not interest her--or by a silent look and smile which more palpably than anything else showed Pierre her superiority. She was right in regarding all arguments as nonsense in comparison with that smile.

She always addressed him with a radiantly confiding smile meant for him alone, in which there was something more significant than in the general smile that usually brightened her face. Pierre knew that everyone was waiting for him to say a word and cross a certain line, and he knew that sooner or later he would step across it, but an incomprehensible terror seized him at the thought of that dreadful step. A thousand times during that month and a half while he felt himself drawn nearer and nearer to that dreadful abyss, Pierre said to himself: "What am I doing? I need resolution. Can it be that I have none?"

He wished to take a decision, but felt with dismay that in this matter he lacked that strength of will which he had known in himself and really possessed. Pierre was one of those who are only strong when they feel themselves quite innocent, and since that day when he was overpowered by a feeling of desire while stooping over the snuffbox at Anna Pavlovna's, an unacknowledged sense of the guilt of that desire paralyzed his will.

On Helene's name day, a small party of just their own people--as his wife said--met for supper at Prince Vasili's. All these friends and relations had been given to understand that the fate of the young girl would be decided that evening. The visitors were seated at supper. Princess Kuragina, a portly imposing woman who had once been handsome, was sitting at the head of the table. On either side of her sat the more important guests--an old general and his wife, and Anna Pavlovna Scherer. At the other end sat the younger and less important guests, and there too sat the members of the family, and Pierre and Helene, side by side. Prince Vasili was not having any supper: he went round the table in a merry mood, sitting down now by one, now by another, of the guests. To each of them he made some careless and agreeable remark except to Pierre and Helene, whose presence he seemed not to notice. He enlivened the whole party. The wax candles burned brightly, the silver and crystal gleamed, so did the ladies' toilets and the gold and silver of the men's epaulets; servants in scarlet liveries moved round the table, the clatter of

plates, knives, and glasses mingled with the animated hum of several conversations. At one end of the table, the old chamberlain was heard assuring an old baroness that he loved her passionately, at which she laughed; at the other could be heard the story of the misfortunes of some Mary Viktorovna or other. At the center of the table, Prince Vasili attracted everybody's attention. With a facetious smile on his face, he was telling the ladies about last Wednesday's meeting of the Imperial Council, at which Sergey Kuzmich Vyazmitinov, the new military governor general of Petersburg, had received and read the then famous rescript of the Emperor Alexander from the army to Sergey Kuzmich, in which the Emperor said that he was receiving from all sides declarations of the people's loyalty, that the declaration from Petersburg gave him particular pleasure, and that he was proud to be at the head of such a nation and would endeavor to be worthy of it. This rescript began with the words: "Sergey Kuzmich, From all sides reports reach me," etc.

"Well, and so he never got farther than: 'Sergey Kuzmich'?" asked one of the ladies.

"Exactly, not a hair's breadth farther," answered Prince Vasili, laughing, "'Sergey Kuzmich... From all sides... From all sides... Sergey Kuzmich...' Poor Vyazmitinov could not get any farther! He began the rescript again and again, but as soon as he uttered 'Sergey' he sobbed, 'Kuz-mi-ch,' tears, and 'From all sides' was smothered in sobs and he could get no farther. And again his handkerchief, and again: 'Sergey Kuzmich, From all sides,'... and tears, till at last somebody else was asked to read it."

"Kuzmich... From all sides... and then tears," someone repeated laughing.

"Don't be unkind," cried Anna Pavlovna from her end of the table holding up a threatening finger. "He is such a worthy and excellent man, our dear Vyazmitinov...."

Everybody laughed a great deal. At the head of the table, where the honored guests sat, everyone seemed to be in high spirits and under the influence of a variety of exciting sensations. Only Pierre and Helene sat silently side by side almost at the bottom of the table, a suppressed smile brightening both their faces, a smile that had nothing to do with Sergey Kuzmich--a smile of bashfulness at their own feelings. But much as all the rest laughed, talked, and joked, much as they enjoyed their Rhine wine, saute, and ices, and however they avoided looking at the young couple, and heedless and unobservant as they seemed of them, one could feel by the occasional glances they gave that the story about Sergey Kuzmich, the laughter, and the food were all a pretense, and that the whole attention of that company was directed to--Pierre and Helene. Prince Vasili mimicked the sobbing of Sergey Kuzmich and at the same time his eyes glanced toward his daughter, and while he laughed the expression on his face clearly said: "Yes... it's getting on, it will all be settled today." Anna Pavlovna threatened him on behalf of "our dear Vyazmitinov," and in her eyes, which, for an instant, glanced at Pierre, Prince Vasili read a congratulation on his future son-in-law and on his daughter's happiness. The old princess sighed sadly as she offered some wine to the old lady next to her and glanced angrily at her daughter, and her sigh seemed to say: "Yes, there's nothing left for you and me but to sip sweet wine, my dear, now that the time has come for these young ones to be thus boldly, provocatively happy." "And what nonsense all this is that I am saying!" thought a diplomatist, glancing at the happy faces of the lovers. "That's happiness!"

Into the insignificant, trifling, and artificial interests uniting that society had entered the simple feeling of the attraction of a healthy and handsome young man and woman for one another. And this human feeling dominated everything else and soared above all their affected chatter. Jests fell flat, news was not interesting, and the animation was evidently forced. Not only the guests but even the footmen waiting at table seemed to feel this, and they forgot their

duties as they looked at the beautiful Helene with her radiant face and at the red, broad, and happy though uneasy face of Pierre. It seemed as if the very light of the candles was focused on those two happy faces alone.

Pierre felt that he was the center of it all, and this both pleased and embarrassed him. He was like a man entirely absorbed in some occupation. He did not see, hear, or understand anything clearly. Only now and then detached ideas and impressions from the world of reality shot unexpectedly through his mind.

"So it is all finished!" he thought. "And how has it all happened? How quickly! Now I know that not because of her alone, nor of myself alone, but because of everyone, it must inevitably come about. They are all expecting it, they are so sure that it will happen that I cannot, I cannot, disappoint them. But how will it be? I do not know, but it will certainly happen!" thought Pierre, glancing at those dazzling shoulders close to his eyes.

Or he would suddenly feel ashamed of he knew not what. He felt it awkward to attract everyone's attention and to be considered a lucky man and, with his plain face, to be looked on as a sort of Paris possessed of a Helen. "But no doubt it always is and must be so!" he consoled himself. "And besides, what have I done to bring it about? How did it begin? I traveled from Moscow with Prince Vasili. Then there was nothing. So why should I not stay at his house? Then I played cards with her and picked up her reticule and drove out with her. How did it begin, when did it all come about?" And here he was sitting by her side as her betrothed, seeing, hearing, feeling her nearness, her breathing, her movements, her beauty. Then it would suddenly seem to him that it was not she but he was so unusually beautiful, and that that was why they all looked so at him, and flattered by this general admiration he would expand his chest, raise his head, and rejoice at his good fortune. Suddenly he heard a familiar voice repeating something to him a second time. But Pierre was so absorbed that he did not understand what was said.

"I am asking you when you last heard from Bolkonski," repeated Prince Vasili a third time. "How absent-minded you are, my dear fellow."

Prince Vasili smiled, and Pierre noticed that everyone was smiling at him and Helene. "Well, what of it, if you all know it?" thought Pierre. "What of it? It's the truth!" and he himself smiled his gentle childlike smile, and Helene smiled too.

"When did you get the letter? Was it from Olmutz?" repeated Prince Vasili, who pretended to want to know this in order to settle a dispute.

"How can one talk or think of such trifles?" thought Pierre.

"Yes, from Olmutz," he answered, with a sigh.

After supper Pierre with his partner followed the others into the drawing room. The guests began to disperse, some without taking leave of Helene. Some, as if unwilling to distract her from an important occupation, came up to her for a moment and made haste to go away, refusing to let her see them off. The diplomatist preserved a mournful silence as he left the drawing room. He pictured the vanity of his diplomatic career in comparison with Pierre's happiness. The old general grumbled at his wife when she asked how his leg was. "Oh, the old fool," he thought. "That Princess Helene will be beautiful still when she's fifty."

"I think I may congratulate you," whispered Anna Pavlovna to the old princess, kissing her soundly. "If I hadn't this headache I'd have stayed longer."

The old princess did not reply, she was tormented by jealousy of her

daughter's happiness.

While the guests were taking their leave Pierre remained for a long time alone with Helene in the little drawing room where they were sitting. He had often before, during the last six weeks, remained alone with her, but had never spoken to her of love. Now he felt that it was inevitable, but he could not make up his mind to take the final step. He felt ashamed; he felt that he was occupying someone else's place here beside Helene. "This happiness is not for you," some inner voice whispered to him. "This happiness is for those who have not in them what there is in you."

But, as he had to say something, he began by asking her whether she was satisfied with the party. She replied in her usual simple manner that this name day of hers had been one of the pleasantest she had ever had.

Some of the nearest relatives had not yet left. They were sitting in the large drawing room. Prince Vasili came up to Pierre with languid footsteps. Pierre rose and said it was getting late. Prince Vasili gave him a look of stern inquiry, as though what Pierre had just said was so strange that one could not take it in. But then the expression of severity changed, and he drew Pierre's hand downwards, made him sit down, and smiled affectionately.

"Well, Lelya?" he asked, turning instantly to his daughter and addressing her with the careless tone of habitual tenderness natural to parents who have petted their children from babyhood, but which Prince Vasili had only acquired by imitating other parents.

And he again turned to Pierre.

"Sergey Kuzmich--From all sides--" he said, unbuttoning the top button of his waistcoat.

Pierre smiled, but his smile showed that he knew it was not the story about Sergey Kuzmich that interested Prince Vasili just then, and Prince Vasili saw that Pierre knew this. He suddenly muttered something and went away. It seemed to Pierre that even the prince was disconcerted. The sight of the discomposure of that old man of the world touched Pierre: he looked at Helene and she too seemed disconcerted, and her look seemed to say: "Well, it is your own fault."

"The step must be taken but I cannot, I cannot!" thought Pierre, and he again began speaking about indifferent matters, about Sergey Kuzmich, asking what the point of the story was as he had not heard it properly. Helene answered with a smile that she too had missed it.

When Prince Vasili returned to the drawing room, the princess, his wife, was talking in low tones to the elderly lady about Pierre.

"Of course, it is a very brilliant match, but happiness, my dear..."

"Marriages are made in heaven," replied the elderly lady.

Prince Vasili passed by, seeming not to hear the ladies, and sat down on a sofa in a far corner of the room. He closed his eyes and seemed to be dozing. His head sank forward and then he roused himself.

"Aline," he said to his wife, "go and see what they are about."

The princess went up to the door, passed by it with a dignified and indifferent air, and glanced into the little drawing room. Pierre and Helene still sat talking just as before.

"Still the same," she said to her husband.

Prince Vasili frowned, twisting his mouth, his cheeks quivered and his face assumed the coarse, unpleasant expression peculiar to him.

Shaking himself, he rose, threw back his head, and with resolute steps went past the ladies into the little drawing room. With quick steps he went joyfully up to Pierre. His face was so unusually triumphant that Pierre rose in alarm on seeing it.

"Thank God!" said Prince Vasili. "My wife has told me everything!" (He put one arm around Pierre and the other around his daughter.)--"My dear boy... Lelya... I am very pleased." (His voice trembled.) "I loved your father... and she will make you a good wife... God bless you!..."

He embraced his daughter, and then again Pierre, and kissed him with his malodorous mouth. Tears actually moistened his cheeks.

"Princess, come here!" he shouted.

The old princess came in and also wept. The elderly lady was using her handkerchief too. Pierre was kissed, and he kissed the beautiful Helene's hand several times. After a while they were left alone again.

"All this had to be and could not be otherwise," thought Pierre, "so it is useless to ask whether it is good or bad. It is good because it's definite and one is rid of the old tormenting doubt." Pierre held the hand of his betrothed in silence, looking at her beautiful bosom as it rose and fell.

"Helene!" he said aloud and paused.

"Something special is always said in such cases," he thought, but could not remember what it was that people say. He looked at her face. She drew nearer to him. Her face flushed.

"Oh, take those off... those..." she said, pointing to his spectacles.

Pierre took them off, and his eyes, besides the strange look eyes have from which spectacles have just been removed, had also a frightened and inquiring look. He was about to stoop over her hand and kiss it, but with a rapid, almost brutal movement of her head, she intercepted his lips and met them with her own. Her face struck Pierre, by its altered, unpleasantly excited expression.

"It is too late now, it's done; besides I love her," thought Pierre.

"Je vous aime!"* he said, remembering what has to be said at such moments: but his words sounded so weak that he felt ashamed of himself.

*"I love you."

Six weeks later he was married, and settled in Count Bezukhov's large, newly furnished Petersburg house, the happy possessor, as people said, of a wife who was a celebrated beauty and of millions of money.

CHAPTER III

Old Prince Nicholas Bolkonski received a letter from Prince Vasili in November, 1805, announcing that he and his son would be paying him a visit. "I am starting on a journey of inspection, and of course I shall think nothing of an extra seventy miles to come and see you at the same time, my honored benefactor," wrote Prince Vasili. "My son Anatole is accompanying me on his way to the army, so I hope you

will allow him personally to express the deep respect that, emulating his father, he feels for you."

"It seems that there will be no need to bring Mary out, suitors are coming to us of their own accord," incautiously remarked the little princess on hearing the news.

Prince Nicholas frowned, but said nothing.

A fortnight after the letter Prince Vasili's servants came one evening in advance of him, and he and his son arrived next day.

Old Bolkonski had always had a poor opinion of Prince Vasili's character, but more so recently, since in the new reigns of Paul and Alexander Prince Vasili had risen to high position and honors. And now, from the hints contained in his letter and given by the little princess, he saw which way the wind was blowing, and his low opinion changed into a feeling of contemptuous ill will. He snorted whenever he mentioned him. On the day of Prince Vasili's arrival, Prince Bolkonski was particularly discontented and out of temper. Whether he was in a bad temper because Prince Vasili was coming, or whether his being in a bad temper made him specially annoyed at Prince Vasili's visit, he was in a bad temper, and in the morning Tikhon had already advised the architect not to go to the prince with his report.

"Do you hear how he's walking?" said Tikhon, drawing the architect's attention to the sound of the prince's footsteps. "Stepping flat on his heels--we know what that means...."

However, at nine o'clock the prince, in his velvet coat with a sable collar and cap, went out for his usual walk. It had snowed the day before and the path to the hothouse, along which the prince was in the habit of walking, had been swept: the marks of the broom were still visible in the snow and a shovel had been left sticking in one of the soft snowbanks that bordered both sides of the path. The prince went through the conservatories, the serfs' quarters, and the outbuildings, frowning and silent.

"Can a sleigh pass?" he asked his overseer, a venerable man, resembling his master in manners and looks, who was accompanying him back to the house.

"The snow is deep. I am having the avenue swept, your honor."

The prince bowed his head and went up to the porch. "God be thanked," thought the overseer, "the storm has blown over!"

"It would have been hard to drive up, your honor," he added. "I heard, your honor, that a minister is coming to visit your honor."

The prince turned round to the overseer and fixed his eyes on him, frowning.

"What? A minister? What minister? Who gave orders?" he said in his shrill, harsh voice. "The road is not swept for the princess my daughter, but for a minister! For me, there are no ministers!"

"Your honor, I thought..."

"You thought!" shouted the prince, his words coming more and more rapidly and indistinctly. "You thought!... Rascals! Blackguards!... I'll teach you to think!" and lifting his stick he swung it and would have hit Alpatych, the overseer, had not the latter instinctively avoided the blow. "Thought... Blackguards..." shouted the prince rapidly.

But although Alpatych, frightened at his own temerity in avoiding the stroke, came up to the prince, bowing his bald head resignedly before him, or perhaps for that very reason, the prince, though he

continued to shout: "Blackgaurds!... Throw the snow back on the road!" did not lift his stick again but hurried into the house.

Before dinner, Princess Mary and Mademoiselle Bourienne, who knew that the prince was in a bad humor, stood awaiting him; Mademoiselle Bourienne with a radiant face that said: "I know nothing, I am the same as usual," and Princess Mary pale, frightened, and with downcast eyes. What she found hardest to bear was to know that on such occasions she ought to behave like Mademoiselle Bourienne, but could not. She thought: "If I seem not to notice he will think that I do not sympathize with him; if I seem sad and out of spirits myself, he will say (as he has done before) that I'm in the dumps."

The prince looked at his daughter's frightened face and snorted.

"Fool... or dummy!" he muttered.

"And the other one is not here. They've been telling tales," he thought--referring to the little princess who was not in the dining room.

"Where is the princess?" he asked. "Hiding?"

"She is not very well," answered Mademoiselle Bourienne with a bright smile, "so she won't come down. It is natural in her state."

"Hm! Hm!" muttered the prince, sitting down.

His plate seemed to him not quite clean, and pointing to a spot he flung it away. Tikhon caught it and handed it to a footman. The little princess was not unwell, but had such an overpowering fear of the prince that, hearing he was in a bad humor, she had decided not to appear.

"I am afraid for the baby," she said to Mademoiselle Bourienne: "Heaven knows what a fright might do."

In general at Bald Hills the little princess lived in constant fear, and with a sense of antipathy to the old prince which she did not realize because the fear was so much the stronger feeling. The prince reciprocated this antipathy, but it was overpowered by his contempt for her. When the little princess had grown accustomed to life at Bald Hills, she took a special fancy to Mademoiselle Bourienne, spent whole days with her, asked her to sleep in her room, and often talked with her about the old prince and criticized him.

"So we are to have visitors, mon prince?" remarked Mademoiselle Bourienne, unfolding her white napkin with her rosy fingers. "His Excellency Prince Vasili Kuragin and his son, I understand?" she said inquiringly.

"Hm!--his excellency is a puppy.... I got him his appointment in the service," said the prince disdainfully. "Why his son is coming I don't understand. Perhaps Princess Elizabeth and Princess Mary know. I don't want him." (He looked at his blushing daughter.) "Are you unwell today? Eh? Afraid of the 'minister' as that idiot Alpatych called him this morning?"

"No, mon pere."

Though Mademoiselle Bourienne had been so unsuccessful in her choice of a subject, she did not stop talking, but chattered about the conservatories and the beauty of a flower that had just opened, and after the soup the prince became more genial.

After dinner, he went to see his daughter-in-law. The little princess was sitting at a small table, chattering with Masha, her maid. She grew pale on seeing her father-in-law.

She was much altered. She was now plain rather than pretty. Her cheeks had sunk, her lip was drawn up, and her eyes drawn down.

"Yes, I feel a kind of oppression," she said in reply to the prince's question as to how she felt.

"Do you want anything?"

"No, merci, mon pere."

"Well, all right, all right."

He left the room and went to the waiting room where Alpatych stood with bowed head.

"Has the snow been shoveled back?"

"Yes, your excellency. Forgive me for heaven's sake... It was only my stupidity."

"All right, all right," interrupted the prince, and laughing his unnatural way, he stretched out his hand for Alpatych to kiss, and then proceeded to his study.

Prince Vasili arrived that evening. He was met in the avenue by coachmen and footmen, who, with loud shouts, dragged his sleighs up to one of the lodges over the road purposely laden with snow.

Prince Vasili and Anatole had separate rooms assigned to them.

Anatole, having taken off his overcoat, sat with arms akimbo before a table on a corner of which he smilingly and absent-mindedly fixed his large and handsome eyes. He regarded his whole life as a continual round of amusement which someone for some reason had to provide for him. And he looked on this visit to a churlish old man and a rich and ugly heiress in the same way. All this might, he thought, turn out very well and amusingly. "And why not marry her if she really has so much money? That never does any harm," thought Anatole.

He shaved and scented himself with the care and elegance which had become habitual to him and, his handsome head held high, entered his father's room with the good-humored and victorious air natural to him. Prince Vasili's two valets were busy dressing him, and he looked round with much animation and cheerfully nodded to his son as the latter entered, as if to say: "Yes, that's how I want you to look."

"I say, Father, joking apart, is she very hideous?" Anatole asked, as if continuing a conversation the subject of which had often been mentioned during the journey.

"Enough! What nonsense! Above all, try to be respectful and cautious with the old prince."

"If he starts a row I'll go away," said Prince Anatole. "I can't bear those old men! Eh?"

"Remember, for you everything depends on this."

In the meantime, not only was it known in the maid-servants' rooms that the minister and his son had arrived, but the appearance of both had been minutely described. Princess Mary was sitting alone in her room, vainly trying to master her agitation.

"Why did they write, why did Lise tell me about it? It can never happen!" she said, looking at herself in the glass. "How shall I enter the drawing room? Even if I like him I can't now be myself with him." The mere thought of her father's look filled her with terror. The little princess and Mademoiselle Bourienne had already received from Masha, the lady's maid, the necessary report of how handsome the minister's son was, with his rosy cheeks and dark eyebrows, and

with what difficulty the father had dragged his legs upstairs while the son had followed him like an eagle, three steps at a time. Having received this information, the little princess and Mademoiselle Bourienne, whose chattering voices had reached her from the corridor, went into Princess Mary's room.

"You know they've come, Marie?" said the little princess, waddling in, and sinking heavily into an armchair.

She was no longer in the loose gown she generally wore in the morning, but had on one of her best dresses. Her hair was carefully done and her face was animated, which, however, did not conceal its sunken and faded outlines. Dressed as she used to be in Petersburg society, it was still more noticeable how much plainer she had become. Some unobtrusive touch had been added to Mademoiselle Bourienne's toilet which rendered her fresh and pretty face yet more attractive.

"What! Are you going to remain as you are, dear princess?" she began. "They'll be announcing that the gentlemen are in the drawing room and we shall have to go down, and you have not smartened yourself up at all!"

The little princess got up, rang for the maid, and hurriedly and merrily began to devise and carry out a plan of how Princess Mary should be dressed. Princess Mary's self-esteem was wounded by the fact that the arrival of a suitor agitated her, and still more so by both her companions' not having the least conception that it could be otherwise. To tell them that she felt ashamed for herself and for them would be to betray her agitation, while to decline their offers to dress her would prolong their banter and insistence. She flushed, her beautiful eyes grew dim, red blotches came on her face, and it took on the unattractive martyrlike expression it so often wore, as she submitted herself to Mademoiselle Bourienne and Lise. Both these women quite sincerely tried to make her look pretty. She was so plain that neither of them could think of her as a rival, so they began dressing her with perfect sincerity, and with the naive and firm conviction women have that dress can make a face pretty.

"No really, my dear, this dress is not pretty," said Lise, looking sideways at Princess Mary from a little distance. "You have a maroon dress, have it fetched. Really! You know the fate of your whole life may be at stake. But this one is too light, it's not becoming!"

It was not the dress, but the face and whole figure of Princess Mary that was not pretty, but neither Mademoiselle Bourienne nor the little princess felt this; they still thought that if a blue ribbon were placed in the hair, the hair combed up, and the blue scarf arranged lower on the best maroon dress, and so on, all would be well. They forgot that the frightened face and the figure could not be altered, and that however they might change the setting and adornment of that face, it would still remain piteous and plain. After two or three changes to which Princess Mary meekly submitted, just as her hair had been arranged on the top of her head (a style that quite altered and spoiled her looks) and she had put on a maroon dress with a pale-blue scarf, the little princess walked twice round her, now adjusting a fold of the dress with her little hand, now arranging the scarf and looking at her with her head bent first on one side and then on the other.

"No, it will not do," she said decidedly, clasping her hands. "No, Mary, really this dress does not suit you. I prefer you in your little gray everyday dress. Now please, do it for my sake. Katie," she said to the maid, "bring the princess her gray dress, and you'll see, Mademoiselle Bourienne, how I shall arrange it," she added, smiling with a foretaste of artistic pleasure.

But when Katie brought the required dress, Princess Mary remained sitting motionless before the glass, looking at her face, and saw in the mirror her eyes full of tears and her mouth quivering, ready to burst into sobs.

"Come, dear princess," said Mademoiselle Bourienne, "just one more little effort."

The little princess, taking the dress from the maid, came up to Princess Mary.

"Well, now we'll arrange something quite simple and becoming," she said.

The three voices, hers, Mademoiselle Bourienne's, and Katie's, who was laughing at something, mingled in a merry sound, like the chirping of birds.

"No, leave me alone," said Princess Mary.

Her voice sounded so serious and so sad that the chirping of the birds was silenced at once. They looked at the beautiful, large, thoughtful eyes full of tears and of thoughts, gazing shiningly and imploringly at them, and understood that it was useless and even cruel to insist.

"At least, change your coiffure," said the little princess.

"Didn't I tell you," she went on, turning reproachfully to Mademoiselle Bourienne, "Mary's is a face which such a coiffure does not suit in the least. Not in the least! Please change it."

"Leave me alone, please leave me alone! It is all quite the same to me," answered a voice struggling with tears.

Mademoiselle Bourienne and the little princess had to own to themselves that Princess Mary in this guise looked very plain, worse than usual, but it was too late. She was looking at them with an expression they both knew, an expression thoughtful and sad. This expression in Princess Mary did not frighten them (she never inspired fear in anyone), but they knew that when it appeared on her face, she became mute and was not to be shaken in her determination.

"You will change it, won't you?" said Lise. And as Princess Mary gave no answer, she left the room.

Princess Mary was left alone. She did not comply with Lise's request, she not only left her hair as it was, but did not even look in her glass. Letting her arms fall helplessly, she sat with downcast eyes and pondered. A husband, a man, a strong dominant and strangely attractive being rose in her imagination, and carried her into a totally different happy world of his own. She fancied a child, her own--such as she had seen the day before in the arms of her nurse's daughter--at her own breast, the husband standing by and gazing tenderly at her and the child. "But no, it is impossible, I am too ugly," she thought.

"Please come to tea. The prince will be out in a moment," came the maid's voice at the door.

She roused herself, and felt appalled at what she had been thinking, and before going down she went into the room where the icons hung and, her eyes fixed on the dark face of a large icon of the Saviour lit by a lamp, she stood before it with folded hands for a few moments. A painful doubt filled her soul. Could the joy of love, of earthly love for a man, be for her? In her thoughts of marriage Princess Mary dreamed of happiness and of children, but her strongest, most deeply hidden longing was for earthly love. The more she tried to hide this feeling from others and even from herself, the stronger it grew. "O God," she said, "how am I to stifle in my heart these temptations of the devil? How am I to renounce forever these vile fancies, so as peacefully to fulfill Thy will?" And scarcely had she put that question than God gave her the answer in her own heart. "Desire nothing for thyself, seek nothing, be not anxious or envious. Man's future and thy own fate must remain hidden from thee,

but live so that thou mayest be ready for anything. If it be God's will to prove thee in the duties of marriage, be ready to fulfill His will." With this consoling thought (but yet with a hope for the fulfillment of her forbidden earthly longing) Princess Mary sighed, and having crossed herself went down, thinking neither of her gown and coiffure nor of how she would go in nor of what she would say. What could all that matter in comparison with the will of God, without Whose care not a hair of man's head can fall?

CHAPTER IV

When Princess Mary came down, Prince Vasili and his son were already in the drawing room, talking to the little princess and Mademoiselle Bourienne. When she entered with her heavy step, treading on her heels, the gentlemen and Mademoiselle Bourienne rose and the little princess, indicating her to the gentlemen, said: "Voila Marie!" Princess Mary saw them all and saw them in detail. She saw Prince Vasili's face, serious for an instant at the sight of her, but immediately smiling again, and the little princess curiously noting the impression "Marie" produced on the visitors. And she saw Mademoiselle Bourienne, with her ribbon and pretty face, and her unusually animated look which was fixed on him, but him she could not see, she only saw something large, brilliant, and handsome moving toward her as she entered the room. Prince Vasili approached first, and she kissed the bold forehead that bent over her hand and answered his question by saying that, on the contrary, she remembered him quite well. Then Anatole came up to her. She still could not see him. She only felt a soft hand taking hers firmly, and she touched with her lips a white forehead, over which was beautiful light-brown hair smelling of pomade. When she looked up at him she was struck by his beauty. Anatole stood with his right thumb under a button of his uniform, his chest expanded and his back drawn in, slightly swinging one foot, and, with his head a little bent, looked with beaming face at the princess without speaking and evidently not thinking about her at all. Anatole was not quick-witted, nor ready or eloquent in conversation, but he had the faculty, so invaluable in society, of composure and imperturbable self-possession. If a man lacking in self-confidence remains dumb on a first introduction and betrays a consciousness of the impropriety of such silence and an anxiety to find something to say, the effect is bad. But Anatole was dumb, swung his foot, and smilingly examined the princess' hair. It was evident that he could be silent in this way for a very long time. "If anyone finds this silence inconvenient, let him talk, but I don't want to," he seemed to say. Besides this, in his behavior to women Anatole had a manner which particularly inspires in them curiosity, awe, and even love--a supercilious consciousness of his own superiority. It was as if he said to them: "I know you, I know you, but why should I bother about you? You'd be only too glad, of course." Perhaps he did not really think this when he met women--even probably he did not, for in general he thought very little--but his looks and manner gave that impression. The princess felt this, and as if wishing to show him that she did not even dare expect to interest him, she turned to his father. The conversation was general and animated, thanks to Princess Lise's voice and little downy lip that lifted over her white teeth. She met Prince Vasili with that playful manner often employed by lively chatty people, and consisting in the assumption that between the person they so address and themselves there are some semi-private, long-established jokes and amusing reminiscences, though no such reminiscences really exist--just as none existed in this case. Prince Vasili readily adopted her tone and the little princess also drew Anatole, whom she hardly knew, into these amusing recollections of things that had never occurred. Mademoiselle Bourienne also shared them and even Princess Mary felt herself pleasantly made to share in these merry reminiscences.

"Here at least we shall have the benefit of your company all to ourselves, dear prince," said the little princess (of course, in French) to Prince Vasili. "It's not as at Annette's* receptions where you always ran away; you remember cette chere Annette!"

*Anna Pavlovna.

"Ah, but you won't talk politics to me like Annette!"

"And our little tea table?"

"Oh, yes!"

"Why is it you were never at Annette's?" the little princess asked Anatole. "Ah, I know, I know," she said with a sly glance, "your brother Hippolyte told me about your goings on. Oh!" and she shook her finger at him, "I have even heard of your doings in Paris!"

"And didn't Hippolyte tell you?" asked Prince Vasili, turning to his son and seizing the little princess' arm as if she would have run away and he had just managed to catch her, "didn't he tell you how he himself was pining for the dear princess, and how she showed him the door? Oh, she is a pearl among women, Princess," he added, turning to Princess Mary.

When Paris was mentioned, Mademoiselle Bourienne for her part seized the opportunity of joining in the general current of recollections.

She took the liberty of inquiring whether it was long since Anatole had left Paris and how he had liked that city. Anatole answered the Frenchwoman very readily and, looking at her with a smile, talked to her about her native land. When he saw the pretty little Bourienne, Anatole came to the conclusion that he would not find Bald Hills dull either. "Not at all bad!" he thought, examining her, "not at all bad, that little companion! I hope she will bring her along with her when we're married, la petite est gentille."*

*The little one is charming.

The old prince dressed leisurely in his study, frowning and considering what he was to do. The coming of these visitors annoyed him. "What are Prince Vasili and that son of his to me? Prince Vasili is a shallow braggart and his son, no doubt, is a fine specimen," he grumbled to himself. What angered him was that the coming of these visitors revived in his mind an unsettled question he always tried to stifle, one about which he always deceived himself. The question was whether he could ever bring himself to part from his daughter and give her to a husband. The prince never directly asked himself that question, knowing beforehand that he would have to answer it justly, and justice clashed not only with his feelings but with the very possibility of life. Life without Princess Mary, little as he seemed to value her, was unthinkable to him. "And why should she marry?" he thought. "To be unhappy for certain. There's Lise, married to Andrew--a better husband one would think could hardly be found nowadays--but is she contented with her lot? And who would marry Marie for love? Plain and awkward! They'll take her for her connections and wealth. Are there no women living unmarried, and even the happier for it?" So thought Prince Bolkonski while dressing, and yet the question he was always putting off demanded an immediate answer. Prince Vasili had brought his son with the evident intention of proposing, and today or tomorrow he would probably ask for an answer. His birth and position in society were not bad. "Well, I've nothing against it," the prince said to himself, "but he must be worthy of her. And that is what we shall see."

"That is what we shall see! That is what we shall see!" he added aloud.

He entered the drawing room with his usual alert step, glancing rapidly round the company. He noticed the change in the little princess' dress, Mademoiselle Bourienne's ribbon, Princess Mary's unbecoming coiffure, Mademoiselle Bourienne's and Anatole's smiles, and the loneliness of his daughter amid the general conversation. "Got herself up like a fool!" he thought, looking irritably at her. "She is shameless, and he ignores her!"

He went straight up to Prince Vasili.

"Well! How d'ye do? How d'ye do? Glad to see you!"

"Friendship laughs at distance," began Prince Vasili in his usual rapid, self-confident, familiar tone. "Here is my second son; please love and befriend him."

Prince Bolkonski surveyed Anatole.

"Fine young fellow! Fine young fellow!" he said. "Well, come and kiss me," and he offered his cheek.

Anatole kissed the old man, and looked at him with curiosity and perfect composure, waiting for a display of the eccentricities his father had told him to expect.

Prince Bolkonski sat down in his usual place in the corner of the sofa and, drawing up an armchair for Prince Vasili, pointed to it and began questioning him about political affairs and news. He seemed to listen attentively to what Prince Vasili said, but kept glancing at Princess Mary.

"And so they are writing from Potsdam already?" he said, repeating Prince Vasili's last words. Then rising, he suddenly went up to his daughter.

"Is it for visitors you've got yourself up like that, eh?" said he. "Fine, very fine! You have done up your hair in this new way for the visitors, and before the visitors I tell you that in future you are never to dare to change your way of dress without my consent."

"It was my fault, mon pere," interceded the little princess, with a blush.

"You must do as you please," said Prince Bolkonski, bowing to his daughter-in-law, "but she need not make a fool of herself, she's plain enough as it is."

And he sat down again, paying no more attention to his daughter, who was reduced to tears.

"On the contrary, that coiffure suits the princess very well," said Prince Vasili.

"Now you, young prince, what's your name?" said Prince Bolkonski, turning to Anatole, "come here, let us talk and get acquainted."

"Now the fun begins," thought Anatole, sitting down with a smile beside the old prince.

"Well, my dear boy, I hear you've been educated abroad, not taught to read and write by the deacon, like your father and me. Now tell me, my dear boy, are you serving in the Horse Guards?" asked the old man, scrutinizing Anatole closely and intently.

"No, I have been transferred to the line," said Anatole, hardly able to restrain his laughter.

"Ah! That's a good thing. So, my dear boy, you wish to serve the Tsar and the country? It is wartime. Such a fine fellow must serve.

"Well, are you off to the front?"

"No, Prince, our regiment has gone to the front, but I am attached... what is it I am attached to, Papa?" said Anatole, turning to his father with a laugh.

"A splendid soldier, splendid! 'What am I attached to!' Ha, ha, ha!" laughed Prince Bolkonski, and Anatole laughed still louder. Suddenly Prince Bolkonski frowned.

"You may go," he said to Anatole.

Anatole returned smiling to the ladies.

"And so you've had him educated abroad, Prince Vasili, haven't you?" said the old prince to Prince Vasili.

"I have done my best for him, and I can assure you the education there is much better than ours."

"Yes, everything is different nowadays, everything is changed. The lad's a fine fellow, a fine fellow! Well, come with me now." He took Prince Vasili's arm and led him to his study. As soon as they were alone together, Prince Vasili announced his hopes and wishes to the old prince.

"Well, do you think I shall prevent her, that I can't part from her?" said the old prince angrily. "What an idea! I'm ready for it tomorrow! Only let me tell you, I want to know my son-in-law better. You know my principles--everything aboveboard? I will ask her tomorrow in your presence; if she is willing, then he can stay on. He can stay and I'll see." The old prince snorted. "Let her marry, it's all the same to me!" he screamed in the same piercing tone as when parting from his son.

"I will tell you frankly," said Prince Vasili in the tone of a crafty man convinced of the futility of being cunning with so keen-sighted companion. "You know, you see right through people. Anatole is no genius, but he is an honest, goodhearted lad; an excellent son or kinsman."

"All right, all right, we'll see!"

As always happens when women lead lonely lives for any length of time without male society, on Anatole's appearance all the three women of Prince Bolkonski's household felt that their life had not been real till then. Their powers of reasoning, feeling, and observing immediately increased tenfold, and their life, which seemed to have been passed in darkness, was suddenly lit up by a new brightness, full of significance.

Princess Mary grew quite unconscious of her face and coiffure. The handsome open face of the man who might perhaps be her husband absorbed all her attention. He seemed to her kind, brave, determined, manly, and magnanimous. She felt convinced of that. Thousands of dreams of a future family life continually rose in her imagination. She drove them away and tried to conceal them.

"But am I not too cold with him?" thought the princess. "I try to be reserved because in the depth of my soul I feel too near to him already, but then he cannot know what I think of him and may imagine that I do not like him."

And Princess Mary tried, but could not manage, to be cordial to her new guest. "Poor girl, she's devilish ugly!" thought Anatole.

Mademoiselle Bourienne, also roused to great excitement by Anatole's arrival, thought in another way. Of course, she, a handsome young woman without any definite position, without relations or even a country, did not intend to devote her life to serving Prince

Bolkonski, to reading aloud to him and being friends with Princess Mary. Mademoiselle Bourienne had long been waiting for a Russian prince who, able to appreciate at a glance her superiority to the plain, badly dressed, ungainly Russian princesses, would fall in love with her and carry her off; and here at last was a Russian prince. Mademoiselle Bourienne knew a story, heard from her aunt but finished in her own way, which she liked to repeat to herself. It was the story of a girl who had been seduced, and to whom her poor mother (*sa pauvre mere*) appeared, and reproached her for yielding to a man without being married. Mademoiselle Bourienne was often touched to tears as in imagination she told this story to him, her seducer. And now he, a real Russian prince, had appeared. He would carry her away and then *sa pauvre mere* would appear and he would marry her. So her future shaped itself in Mademoiselle Bourienne's head at the very time she was talking to Anatole about Paris. It was not calculation that guided her (she did not even for a moment consider what she should do), but all this had long been familiar to her, and now that Anatole had appeared it just grouped itself around him and she wished and tried to please him as much as possible.

The little princess, like an old war horse that hears the trumpet, unconsciously and quite forgetting her condition, prepared for the familiar gallop of coquetry, without any ulterior motive or any struggle, but with naive and lighthearted gaiety.

Although in female society Anatole usually assumed the role of a man tired of being run after by women, his vanity was flattered by the spectacle of his power over these three women. Besides that, he was beginning to feel for the pretty and provocative Mademoiselle Bourienne that passionate animal feeling which was apt to master him with great suddenness and prompt him to the coarsest and most reckless actions.

After tea, the company went into the sitting room and Princess Mary was asked to play on the clavichord. Anatole, laughing and in high spirits, came and leaned on his elbows, facing her and beside Mademoiselle Bourienne. Princess Mary felt his look with a painfully joyous emotion. Her favorite sonata bore her into a most intimately poetic world and the look she felt upon her made that world still more poetic. But Anatole's expression, though his eyes were fixed on her, referred not to her but to the movements of Mademoiselle Bourienne's little foot, which he was then touching with his own under the clavichord. Mademoiselle Bourienne was also looking at Princess Mary, and in her lovely eyes there was a look of fearful joy and hope that was also new to the princess.

"How she loves me!" thought Princess Mary. "How happy I am now, and how happy I may be with such a friend and such a husband! Husband? Can it be possible?" she thought, not daring to look at his face, but still feeling his eyes gazing at her.

In the evening, after supper, when all were about to retire, Anatole kissed Princess Mary's hand. She did not know how she found the courage, but she looked straight into his handsome face as it came near to her shortsighted eyes. Turning from Princess Mary he went up and kissed Mademoiselle Bourienne's hand. (This was not etiquette, but then he did everything so simply and with such assurance!) Mademoiselle Bourienne flushed, and gave the princess a frightened look.

"What delicacy!" thought the princess. "Is it possible that Amelie" (Mademoiselle Bourienne) "thinks I could be jealous of her, and not value her pure affection and devotion to me?" She went up to her and kissed her warmly. Anatole went up to kiss the little princess' hand.

"No! No! No! When your father writes to tell me that you are behaving well I will give you my hand to kiss. Not till then!" she said. And smilingly raising a finger at him, she left the room.

CHAPTER V

They all separated, but, except Anatole who fell asleep as soon as he got into bed, all kept awake a long time that night.

"Is he really to be my husband, this stranger who is so kind--yes, kind, that is the chief thing," thought Princess Mary; and fear, which she had seldom experienced, came upon her. She feared to look round, it seemed to her that someone was there standing behind the screen in the dark corner. And this someone was he--the devil--and he was also this man with the white forehead, black eyebrows, and red lips.

She rang for her maid and asked her to sleep in her room.

Mademoiselle Bourienne walked up and down the conservatory for a long time that evening, vainly expecting someone, now smiling at someone, now working herself up to tears with the imaginary words of her pauvre mere rebuking her for her fall.

The little princess grumbled to her maid that her bed was badly made. She could not lie either on her face or on her side. Every position was awkward and uncomfortable, and her burden oppressed her now more than ever because Anatole's presence had vividly recalled to her the time when she was not like that and when everything was light and gay. She sat in an armchair in her dressing jacket and nightcap and Katie, sleepy and disheveled, beat and turned the heavy feather bed for the third time, muttering to herself.

"I told you it was all lumps and holes!" the little princess repeated. "I should be glad enough to fall asleep, so it's not my fault!" and her voice quivered like that of a child about to cry.

The old prince did not sleep either. Tikhon, half asleep, heard him pacing angrily about and snorting. The old prince felt as though he had been insulted through his daughter. The insult was the more pointed because it concerned not himself but another, his daughter, whom he loved more than himself. He kept telling himself that he would consider the whole matter and decide what was right and how he should act, but instead of that he only excited himself more and more.

"The first man that turns up--she forgets her father and everything else, runs upstairs and does up her hair and wags her tail and is unlike herself! Glad to throw her father over! And she knew I should notice it. Fr... fr... fr! And don't I see that that idiot had eyes only for Bourienne--I shall have to get rid of her. And how is it she has not pride enough to see it? If she has no pride for herself she might at least have some for my sake! She must be shown that the blockhead thinks nothing of her and looks only at Bourienne. No, she has no pride... but I'll let her see...."

The old prince knew that if he told his daughter she was making a mistake and that Anatole meant to flirt with Mademoiselle Bourienne, Princess Mary's self-esteem would be wounded and his point (not to be parted from her) would be gained, so pacifying himself with this thought, he called Tikhon and began to undress.

"What devil brought them here?" thought he, while Tikhon was putting the nightshirt over his dried-up old body and gray-haired chest. "I never invited them. They came to disturb my life--and there is not much of it left."

"Devil take 'em!" he muttered, while his head was still covered by the shirt.

Tikhon knew his master's habit of sometimes thinking aloud, and therefore met with unaltered looks the angrily inquisitive expression of the face that emerged from the shirt.

"Gone to bed?" asked the prince.

Tikhon, like all good valets, instinctively knew the direction of his master's thoughts. He guessed that the question referred to Prince Vasili and his son.

"They have gone to bed and put out their lights, your excellency."

"No good... no good..." said the prince rapidly, and thrusting his feet into his slippers and his arms into the sleeves of his dressing gown, he went to the couch on which he slept.

Though no words had passed between Anatole and Mademoiselle Bourienne, they quite understood one another as to the first part of their romance, up to the appearance of the pauvre mere; they understood that they had much to say to one another in private and so they had been seeking an opportunity since morning to meet one another alone. When Princess Mary went to her father's room at the usual hour, Mademoiselle Bourienne and Anatole met in the conservatory.

Princess Mary went to the door of the study with special trepidation. It seemed to her that not only did everybody know that her fate would be decided that day, but that they also knew what she thought about it. She read this in Tikhon's face and in that of Prince Vasili's valet, who made her a low bow when she met him in the corridor carrying hot water.

The old prince was very affectionate and careful in his treatment of his daughter that morning. Princess Mary well knew this painstaking expression of her father's. His face wore that expression when his dry hands clenched with vexation at her not understanding a sum in arithmetic, when rising from his chair he would walk away from her, repeating in a low voice the same words several times over.

He came to the point at once, treating her ceremoniously.

"I have had a proposition made me concerning you," he said with an unnatural smile. "I expect you have guessed that Prince Vasili has not come and brought his pupil with him" (for some reason Prince Bolkonski referred to Anatole as a "pupil") "for the sake of my beautiful eyes. Last night a proposition was made me on your account and, as you know my principles, I refer it to you."

"How am I to understand you, mon pere?" said the princess, growing pale and then blushing.

"How understand me!" cried her father angrily. "Prince Vasili finds you to his taste as a daughter-in-law and makes a proposal to you on his pupil's behalf. That's how it's to be understood! 'How understand it'!... And I ask you!"

"I do not know what you think, Father," whispered the princess.

"I? I? What of me? Leave me out of the question. I'm not going to get married. What about you? That's what I want to know."

The princess saw that her father regarded the matter with disapproval, but at that moment the thought occurred to her that her fate would be decided now or never. She lowered her eyes so as not to see the gaze under which she felt that she could not think, but would only be able to submit from habit, and she said: "I wish only to do your will, but if I had to express my own desire..." She had no time to finish. The old prince interrupted her.

"That's admirable!" he shouted. "He will take you with your dowry and take Mademoiselle Bourienne into the bargain. She'll be the wife, while you..."

The prince stopped. He saw the effect these words had produced on his daughter. She lowered her head and was ready to burst into tears.

"Now then, now then, I'm only joking!" he said. "Remember this, Princess, I hold to the principle that a maiden has a full right to choose. I give you freedom. Only remember that your life's happiness depends on your decision. Never mind me!"

"But I do not know, Father!"

"There's no need to talk! He receives his orders and will marry you or anybody; but you are free to choose.... Go to your room, think it over, and come back in an hour and tell me in his presence: yes or no. I know you will pray over it. Well, pray if you like, but you had better think it over. Go! Yes or no, yes or no, yes or no!" he still shouted when the princess, as if lost in a fog, had already staggered out of the study.

Her fate was decided and happily decided. But what her father had said about Mademoiselle Bourienne was dreadful. It was untrue to be sure, but still it was terrible, and she could not help thinking of it. She was going straight on through the conservatory, neither seeing nor hearing anything, when suddenly the well-known whispering of Mademoiselle Bourienne aroused her. She raised her eyes, and two steps away saw Anatole embracing the Frenchwoman and whispering something to her. With a horrified expression on his handsome face, Anatole looked at Princess Mary, but did not at once take his arm from the waist of Mademoiselle Bourienne who had not yet seen her.

"Who's that? Why? Wait a moment!" Anatole's face seemed to say. Princess Mary looked at them in silence. She could not understand it. At last Mademoiselle Bourienne gave a scream and ran away. Anatole bowed to Princess Mary with a gay smile, as if inviting her to join in a laugh at this strange incident, and then shrugging his shoulders went to the door that led to his own apartments.

An hour later, Tikhon came to call Princess Mary to the old prince; he added that Prince Vasili was also there. When Tikhon came to her Princess Mary was sitting on the sofa in her room, holding the weeping Mademoiselle Bourienne in her arms and gently stroking her hair. The princess' beautiful eyes with all their former calm radiance were looking with tender affection and pity at Mademoiselle Bourienne's pretty face.

"No, Princess, I have lost your affection forever!" said Mademoiselle Bourienne.

"Why? I love you more than ever," said Princess Mary, "and I will try to do all I can for your happiness."

"But you despise me. You who are so pure can never understand being so carried away by passion. Oh, only my poor mother..."

"I quite understand," answered Princess Mary, with a sad smile. "Calm yourself, my dear. I will go to my father," she said, and went out.

Prince Vasili, with one leg thrown high over the other and a snuffbox in his hand, was sitting there with a smile of deep emotion on his face, as if stirred to his heart's core and himself regretting and laughing at his own sensibility, when Princess Mary entered. He hurriedly took a pinch of snuff.

"Ah, my dear, my dear!" he began, rising and taking her by both hands. Then, sighing, he added: "My son's fate is in your hands. Decide, my dear, good, gentle Marie, whom I have always loved as a daughter!"

He drew back and a real tear appeared in his eye.

"Fr... fr..." snorted Prince Bolkonski. "The prince is making a proposition to you in his pupil's--I mean, his son's--name. Do you wish or not to be Prince Anatole Kuragin's wife? Reply: yes or no," he shouted, "and then I shall reserve the right to state my opinion also. Yes, my opinion, and only my opinion," added Prince Bolkonski, turning to Prince Vasili and answering his imploring look. "Yes, or no?"

"My desire is never to leave you, Father, never to separate my life from yours. I don't wish to marry," she answered positively, glancing at Prince Vasili and at her father with her beautiful eyes.

"Humbug! Nonsense! Humbug, humbug, humbug!" cried Prince Bolkonski, frowning and taking his daughter's hand; he did not kiss her, but only bending his forehead to hers just touched it, and pressed her hand so that she winced and uttered a cry.

Prince Vasili rose.

"My dear, I must tell you that this is a moment I shall never, never forget. But, my dear, will you not give us a little hope of touching this heart, so kind and generous? Say 'perhaps'... The future is so long. Say 'perhaps.'"

"Prince, what I have said is all there is in my heart. I thank you for the honor, but I shall never be your son's wife."

"Well, so that's finished, my dear fellow! I am very glad to have seen you. Very glad! Go back to your rooms, Princess. Go!" said the old prince. "Very, very glad to have seen you," repeated he, embracing Prince Vasili.

"My vocation is a different one," thought Princess Mary. "My vocation is to be happy with another kind of happiness, the happiness of love and self-sacrifice. And cost what it may, I will arrange poor Amelie's happiness, she loves him so passionately, and so passionately repents. I will do all I can to arrange the match between them. If he is not rich I will give her the means; I will ask my father and Andrew. I shall be so happy when she is his wife. She is so unfortunate, a stranger, alone, helpless! And, oh God, how passionately she must love him if she could so far forget herself! Perhaps I might have done the same!..." thought Princess Mary.

CHAPTER VI

It was long since the Rostovs had news of Nicholas. Not till midwinter was the count at last handed a letter addressed in his son's handwriting. On receiving it, he ran on tiptoe to his study in alarm and haste, trying to escape notice, closed the door, and began to read the letter.

Anna Mikhaylovna, who always knew everything that passed in the house, on hearing of the arrival of the letter went softly into the room and found the count with it in his hand, sobbing and laughing at the same time.

Anna Mikhaylovna, though her circumstances had improved, was still living with the Rostovs.

"My dear friend?" said she, in a tone of pathetic inquiry, prepared to sympathize in any way.

The count sobbed yet more.

"Nikolenka... a letter... wa... a... s... wounded... my darling boy... the countess... promoted to be an officer... thank God... How

tell the little countess!"

Anna Mikhaylovna sat down beside him, with her own handkerchief wiped the tears from his eyes and from the letter, then having dried her own eyes she comforted the count, and decided that at dinner and till teatime she would prepare the countess, and after tea, with God's help, would inform her.

At dinner Anna Mikhaylovna talked the whole time about the war news and about Nikolenka, twice asked when the last letter had been received from him, though she knew that already, and remarked that they might very likely be getting a letter from him that day. Each time that these hints began to make the countess anxious and she glanced uneasily at the count and at Anna Mikhaylovna, the latter very adroitly turned the conversation to insignificant matters. Natasha, who, of the whole family, was the most gifted with a capacity to feel any shades of intonation, look, and expression, pricked up her ears from the beginning of the meal and was certain that there was some secret between her father and Anna Mikhaylovna, that it had something to do with her brother, and that Anna Mikhaylovna was preparing them for it. Bold as she was, Natasha, who knew how sensitive her mother was to anything relating to Nikolenka, did not venture to ask any questions at dinner, but she was too excited to eat anything and kept wriggling about on her chair regardless of her governess' remarks. After dinner, she rushed head long after Anna Mikhaylovna and, dashing at her, flung herself on her neck as soon as she overtook her in the sitting room.

"Auntie, darling, do tell me what it is!"

"Nothing, my dear."

"No, dearest, sweet one, honey, I won't give up--I know you know something."

Anna Mikhaylovna shook her head.

"You are a little slyboots," she said.

"A letter from Nikolenka! I'm sure of it!" exclaimed Natasha, reading confirmation in Anna Mikhaylovna's face.

"But for God's sake, be careful, you know how it may affect your mamma."

"I will, I will, only tell me! You won't? Then I will go and tell at once."

Anna Mikhaylovna, in a few words, told her the contents of the letter, on condition that she should tell no one.

"No, on my true word of honor," said Natasha, crossing herself, "I won't tell anyone!" and she ran off at once to Sonya.

"Nikolenka... wounded... a letter," she announced in gleeful triumph.

"Nicholas!" was all Sonya said, instantly turning white.

Natasha, seeing the impression the of her brother's wound produced on Sonya, felt for the first time the sorrowful side of the news.

She rushed to Sonya, hugged her, and began to cry.

"A little wound, but he has been made an officer; he is well now, he wrote himself," said she through her tears.

"There now! It's true that all you women are crybabies," remarked Petya, pacing the room with large, resolute strides. "Now I'm very glad, very glad indeed, that my brother has distinguished himself

so. You are all blubberers and understand nothing."

Natasha smiled through her tears.

"You haven't read the letter?" asked Sonya.

"No, but she said that it was all over and that he's now an officer."

"Thank God!" said Sonya, crossing herself. "But perhaps she deceived you. Let us go to Mamma."

Petya paced the room in silence for a time.

"If I'd been in Nikolenka's place I would have killed even more of those Frenchmen," he said. "What nasty brutes they are! I'd have killed so many that there'd have been a heap of them."

"Hold your tongue, Petya, what a goose you are!"

"I'm not a goose, but they are who cry about trifles," said Petya.

"Do you remember him?" Natasha suddenly asked, after a moment's silence.

Sonya smiled.

"Do I remember Nicholas?"

"No, Sonya, but do you remember so that you remember him perfectly, remember everything?" said Natasha, with an expressive gesture, evidently wishing to give her words a very definite meaning. "I remember Nikolenka too, I remember him well," she said. "But I don't remember Boris. I don't remember him a bit."

"What! You don't remember Boris?" asked Sonya in surprise.

"It's not that I don't remember--I know what he is like, but not as I remember Nikolenka. Him--I just shut my eyes and remember, but Boris... No!" (She shut her eyes.) "No! there's nothing at all."

"Oh, Natasha!" said Sonya, looking ecstatically and earnestly at her friend as if she did not consider her worthy to hear what she meant to say and as if she were saying it to someone else, with whom joking was out of the question, "I am in love with your brother once for all and, whatever may happen to him or to me, shall never cease to love him as long as I live."

Natasha looked at Sonya with wondering and inquisitive eyes, and said nothing. She felt that Sonya was speaking the truth, that there was such love as Sonya was speaking of. But Natasha had not yet felt anything like it. She believed it could be, but did not understand it.

"Shall you write to him?" she asked.

Sonya became thoughtful. The question of how to write to Nicholas, and whether she ought to write, tormented her. Now that he was already an officer and a wounded hero, would it be right to remind him of herself and, as it might seem, of the obligations to her he had taken on himself?

"I don't know. I think if he writes, I will write too," she said, blushing.

"And you won't feel ashamed to write to him?"

Sonya smiled.

"No."

"And I should be ashamed to write to Boris. I'm not going to."

"Why should you be ashamed?"

"Well, I don't know. It's awkward and would make me ashamed."

"And I know why she'd be ashamed," said Petya, offended by Natasha's previous remark. "It's because she was in love with that fat one in spectacles" (that was how Petya described his namesake, the new Count Bezukhov) "and now she's in love with that singer" (he meant Natasha's Italian singing master), "that's why she's ashamed!"

"Petya, you're a stupid!" said Natasha.

"Not more stupid than you, madam," said the nine-year-old Petya, with the air of an old brigadier.

The countess had been prepared by Anna Mikhaylovna's hints at dinner. On retiring to her own room, she sat in an armchair, her eyes fixed on a miniature portrait of her son on the lid of a snuffbox, while the tears kept coming into her eyes. Anna Mikhaylovna, with the letter, came on tiptoe to the countess' door and paused.

"Don't come in," she said to the old count who was following her. "Come later." And she went in, closing the door behind her.

The count put his ear to the keyhole and listened.

At first he heard the sound of indifferent voices, then Anna Mikhaylovna's voice alone in a long speech, then a cry, then silence, then both voices together with glad intonations, and then footsteps. Anna Mikhaylovna opened the door. Her face wore the proud expression of a surgeon who has just performed a difficult operation and admits the public to appreciate his skill.

"It is done!" she said to the count, pointing triumphantly to the countess, who sat holding in one hand the snuffbox with its portrait and in the other the letter, and pressing them alternately to her lips.

When she saw the count, she stretched out her arms to him, embraced his bald head, over which she again looked at the letter and the portrait, and in order to press them again to her lips, she slightly pushed away the bald head. Vera, Natasha, Sonya, and Petya now entered the room, and the reading of the letter began. After a brief description of the campaign and the two battles in which he had taken part, and his promotion, Nicholas said that he kissed his father's and mother's hands asking for their blessing, and that he kissed Vera, Natasha, and Petya. Besides that, he sent greetings to Monsieur Schelling, Madame Schoss, and his old nurse, and asked them to kiss for him "dear Sonya, whom he loved and thought of just the same as ever." When she heard this Sonya blushed so that tears came into her eyes and, unable to bear the looks turned upon her, ran away into the dancing hall, whirled round it at full speed with her dress puffed out like a balloon, and, flushed and smiling, plumped down on the floor. The countess was crying.

"Why are you crying, Mamma?" asked Vera. "From all he says one should be glad and not cry."

This was quite true, but the count, the countess, and Natasha looked at her reproachfully. "And who is it she takes after?" thought the countess.

Nicholas' letter was read over hundreds of times, and those who were considered worthy to hear it had to come to the countess, for she did not let it out of her hands. The tutors came, and the nurses, and Dmitri, and several acquaintances, and the countess reread the letter each time with fresh pleasure and each time discovered in it fresh proofs of Nikolenka's virtues. How strange, how extraordinary,

how joyful it seemed, that her son, the scarcely perceptible motion of whose tiny limbs she had felt twenty years ago within her, that son about whom she used to have quarrels with the too indulgent count, that son who had first learned to say "pear" and then "granny," that this son should now be away in a foreign land amid strange surroundings, a manly warrior doing some kind of man's work of his own, without help or guidance. The universal experience of ages, showing that children do grow imperceptibly from the cradle to manhood, did not exist for the countess. Her son's growth toward manhood, at each of its stages, had seemed as extraordinary to her as if there had never existed the millions of human beings who grew up in the same way. As twenty years before, it seemed impossible that the little creature who lived somewhere under her heart would ever cry, suck her breast, and begin to speak, so now she could not believe that that little creature could be this strong, brave man, this model son and officer that, judging by this letter, he now was.

"What a style! How charmingly he describes!" said she, reading the descriptive part of the letter. "And what a soul! Not a word about himself.... Not a word! About some Denisov or other, though he himself, I dare say, is braver than any of them. He says nothing about his sufferings. What a heart! How like him it is! And how he has remembered everybody! Not forgetting anyone. I always said when he was only so high--I always said...."

For more than a week preparations were being made, rough drafts of letters to Nicholas from all the household were written and copied out, while under the supervision of the countess and the solicitude of the count, money and all things necessary for the uniform and equipment of the newly commissioned officer were collected. Anna Mikhaylovna, practical woman that she was, had even managed by favor with army authorities to secure advantageous means of communication for herself and her son. She had opportunities of sending her letters to the Grand Duke Constantine Pavlovich, who commanded the Guards. The Rostovs supposed that The Russian Guards, Abroad, was quite a definite address, and that if a letter reached the Grand Duke in command of the Guards there was no reason why it should not reach the Pavlograd regiment, which was presumably somewhere in the same neighborhood. And so it was decided to send the letters and money by the Grand Duke's courier to Boris and Boris was to forward them to Nicholas. The letters were from the old count, the countess, Petya, Vera, Natasha, and Sonya, and finally there were six thousand rubles for his outfit and various other things the old count sent to his son.

CHAPTER VII

On the twelfth of November, Kutuzov's active army, in camp before Olmutz, was preparing to be reviewed next day by the two Emperors--the Russian and the Austrian. The Guards, just arrived from Russia, spent the night ten miles from Olmutz and next morning were to come straight to the review, reaching the field at Olmutz by ten o'clock.

That day Nicholas Rostov received a letter from Boris, telling him that the Ismaylov regiment was quartered for the night ten miles from Olmutz and that he wanted to see him as he had a letter and money for him. Rostov was particularly in need of money now that the troops, after their active service, were stationed near Olmutz and the camp swarmed with well-provisioned sutlers and Austrian Jews offering all sorts of tempting wares. The Pavlograds held feast after feast, celebrating awards they had received for the campaign, and made expeditions to Olmutz to visit a certain Caroline the Hungarian, who had recently opened a restaurant there with girls as waitresses. Rostov, who had just celebrated his promotion to a cornetcy and bought Denisov's horse, Bedouin, was in debt all round, to his comrades and the sutlers. On receiving Boris' letter he rode with a fellow

officer to Olmutz, dined there, drank a bottle of wine, and then set off alone to the Guards' camp to find his old playmate. Rostov had not yet had time to get his uniform. He had on a shabby cadet jacket, decorated with a soldier's cross, equally shabby cadet's riding breeches lined with worn leather, and an officer's saber with a sword knot. The Don horse he was riding was one he had bought from a Cossack during the campaign, and he wore a crumpled hussar cap stuck jauntily back on one side of his head. As he rode up to the camp he thought how he would impress Boris and all his comrades of the Guards by his appearance--that of a fighting hussar who had been under fire.

The Guards had made their whole march as if on a pleasure trip, parading their cleanliness and discipline. They had come by easy stages, their knapsacks conveyed on carts, and the Austrian authorities had provided excellent dinners for the officers at every halting place. The regiments had entered and left the town with their bands playing, and by the Grand Duke's orders the men had marched all the way in step (a practice on which the Guards prided themselves), the officers on foot and at their proper posts. Boris had been quartered, and had marched all the way, with Berg who was already in command of a company. Berg, who had obtained his captaincy during the campaign, had gained the confidence of his superiors by his promptitude and accuracy and had arranged his money matters very satisfactorily. Boris, during the campaign, had made the acquaintance of many persons who might prove useful to him, and by a letter of recommendation he had brought from Pierre had become acquainted with Prince Andrew Bolkonski, through whom he hoped to obtain a post on the commander in chief's staff. Berg and Boris, having rested after yesterday's march, were sitting, clean and neatly dressed, at a round table in the clean quarters allotted to them, playing chess. Berg held a smoking pipe between his knees. Boris, in the accurate way characteristic of him, was building a little pyramid of chessmen with his delicate white fingers while awaiting Berg's move, and watched his opponent's face, evidently thinking about the game as he always thought only of whatever he was engaged on.

"Well, how are you going to get out of that?" he remarked.

"We'll try to," replied Berg, touching a pawn and then removing his hand.

At that moment the door opened.

"Here he is at last!" shouted Rostov. "And Berg too! Oh, you petisenfans, allay cushay dormir!" he exclaimed, imitating his Russian nurse's French, at which he and Boris used to laugh long ago.

"Dear me, how you have changed!"

Boris rose to meet Rostov, but in doing so did not omit to steady and replace some chessmen that were falling. He was about to embrace his friend, but Nicholas avoided him. With that peculiar feeling of youth, that dread of beaten tracks, and wish to express itself in a manner different from that of its elders which is often insincere, Nicholas wished to do something special on meeting his friend. He wanted to pinch him, push him, do anything but kiss him--a thing everybody did. But notwithstanding this, Boris embraced him in a quiet, friendly way and kissed him three times.

They had not met for nearly half a year and, being at the age when young men take their first steps on life's road, each saw immense changes in the other, quite a new reflection of the society in which they had taken those first steps. Both had changed greatly since they last met and both were in a hurry to show the changes that had taken place in them.

"Oh, you damned dandies! Clean and fresh as if you'd been to a fete, not like us sinners of the line," cried Rostov, with martial swagger

and with baritone notes in his voice, new to Boris, pointing to his own mud-bespattered breeches. The German landlady, hearing Rostov's loud voice, popped her head in at the door.

"Eh, is she pretty?" he asked with a wink.

"Why do you shout so? You'll frighten them!" said Boris. "I did not expect you today," he added. "I only sent you the note yesterday by Bolkonski--an adjutant of Kutuzov's, who's a friend of mine. I did not think he would get it to you so quickly.... Well, how are you? Been under fire already?" asked Boris.

Without answering, Rostov shook the soldier's Cross of St. George fastened to the cording of his uniform and, indicating a bandaged arm, glanced at Berg with a smile.

"As you see," he said.

"Indeed? Yes, yes!" said Boris, with a smile. "And we too have had a splendid march. You know, of course, that His Imperial Highness rode with our regiment all the time, so that we had every comfort and every advantage. What receptions we had in Poland! What dinners and balls! I can't tell you. And the Tsarevich was very gracious to all our officers."

And the two friends told each other of their doings, the one of his hussar revels and life in the fighting line, the other of the pleasures and advantages of service under members of the Imperial family.

"Oh, you Guards!" said Rostov. "I say, send for some wine."

Boris made a grimace.

"If you really want it," said he.

He went to his bed, drew a purse from under the clean pillow, and sent for wine.

"Yes, and I have some money and a letter to give you," he added.

Rostov took the letter and, throwing the money on the sofa, put both arms on the table and began to read. After reading a few lines, he glanced angrily at Berg, then, meeting his eyes, hid his face behind the letter.

"Well, they've sent you a tidy sum," said Berg, eying the heavy purse that sank into the sofa. "As for us, Count, we get along on our pay. I can tell you for myself..."

"I say, Berg, my dear fellow," said Rostov, "when you get a letter from home and meet one of your own people whom you want to talk everything over with, and I happen to be there, I'll go at once, to be out of your way! Do go somewhere, anywhere... to the devil!" he exclaimed, and immediately seizing him by the shoulder and looking amiably into his face, evidently wishing to soften the rudeness of his words, he added, "Don't be hurt, my dear fellow; you know I speak from my heart as to an old acquaintance."

"Oh, don't mention it, Count! I quite understand," said Berg, getting up and speaking in a muffled and guttural voice.

"Go across to our hosts: they invited you," added Boris.

Berg put on the cleanest of coats, without a spot or speck of dust, stood before a looking glass and brushed the hair on his temples upwards, in the way affected by the Emperor Alexander, and, having assured himself from the way Rostov looked at it that his coat had been noticed, left the room with a pleasant smile.

"Oh dear, what a beast I am!" muttered Rostov, as he read the letter.

"Why?"

"Oh, what a pig I am, not to have written and to have given them such a fright! Oh, what a pig I am!" he repeated, flushing suddenly.
"Well, have you sent Gabriel for some wine? All right let's have some!"

In the letter from his parents was enclosed a letter of recommendation to Bagration which the old countess at Anna Mikhaylovna's advice had obtained through an acquaintance and sent to her son, asking him to take it to its destination and make use of it.

"What nonsense! Much I need it!" said Rostov, throwing the letter under the table.

"Why have you thrown that away?" asked Boris.

"It is some letter of recommendation... what the devil do I want it for!"

"Why 'What the devil'?" said Boris, picking it up and reading the address. "This letter would be of great use to you."

"I want nothing, and I won't be anyone's adjutant."

"Why not?" inquired Boris.

"It's a lackey's job!"

"You are still the same dreamer, I see," remarked Boris, shaking his head.

"And you're still the same diplomatist! But that's not the point... Come, how are you?" asked Rostov.

"Well, as you see. So far everything's all right, but I confess I should much like to be an adjutant and not remain at the front."

"Why?"

"Because when once a man starts on military service, he should try to make as successful a career of it as possible."

"Oh, that's it!" said Rostov, evidently thinking of something else.

He looked intently and inquiringly into his friend's eyes, evidently trying in vain to find the answer to some question.

Old Gabriel brought in the wine.

"Shouldn't we now send for Berg?" asked Boris. "He would drink with you. I can't."

"Well, send for him... and how do you get on with that German?" asked Rostov, with a contemptuous smile.

"He is a very, very nice, honest, and pleasant fellow," answered Boris.

Again Rostov looked intently into Boris' eyes and sighed. Berg returned, and over the bottle of wine conversation between the three officers became animated. The Guardsmen told Rostov of their march and how they had been made much of in Russia, Poland, and abroad. They spoke of the sayings and doings of their commander, the Grand Duke, and told stories of his kindness and irascibility. Berg, as usual, kept silent when the subject did not relate to himself, but in

connection with the stories of the Grand Duke's quick temper he related with gusto how in Galicia he had managed to deal with the Grand Duke when the latter made a tour of the regiments and was annoyed at the irregularity of a movement. With a pleasant smile Berg related how the Grand Duke had ridden up to him in a violent passion, shouting: "Arnauts!" ("Arnauts" was the Tsarevich's favorite expression when he was in a rage) and called for the company commander.

"Would you believe it, Count, I was not at all alarmed, because I knew I was right. Without boasting, you know, I may say that I know the Army Orders by heart and know the Regulations as well as I do the Lord's Prayer. So, Count, there never is any negligence in my company, and so my conscience was at ease. I came forward...." (Berg stood up and showed how he presented himself, with his hand to his cap, and really it would have been difficult for a face to express greater respect and self-complacency than his did.) "Well, he stormed at me, as the saying is, stormed and stormed and stormed! It was not a matter of life but rather of death, as the saying is. 'Albanians!' and 'devils!' and 'To Siberia!'" said Berg with a sagacious smile. "I knew I was in the right so I kept silent; was not that best, Count?... 'Hey, are you dumb?' he shouted. Still I remained silent. And what do you think, Count? The next day it was not even mentioned in the Orders of the Day. That's what keeping one's head means. That's the way, Count," said Berg, lighting his pipe and emitting rings of smoke.

"Yes, that was fine," said Rostov, smiling.

But Boris noticed that he was preparing to make fun of Berg, and skillfully changed the subject. He asked him to tell them how and where he got his wound. This pleased Rostov and he began talking about it, and as he went on became more and more animated. He told them of his Schon Grabern affair, just as those who have taken part in a battle generally do describe it, that is, as they would like it to have been, as they have heard it described by others, and as sounds well, but not at all as it really was. Rostov was a truthful young man and would on no account have told a deliberate lie. He began his story meaning to tell everything just as it happened, but imperceptibly, involuntarily, and inevitably he lapsed into falsehood. If he had told the truth to his hearers--who like himself had often heard stories of attacks and had formed a definite idea of what an attack was and were expecting to hear just such a story--they would either not have believed him or, still worse, would have thought that Rostov was himself to blame since what generally happens to the narrators of cavalry attacks had not happened to him. He could not tell them simply that everyone went at a trot and that he fell off his horse and sprained his arm and then ran as hard as he could from a Frenchman into the wood. Besides, to tell everything as it really happened, it would have been necessary to make an effort of will to tell only what happened. It is very difficult to tell the truth, and young people are rarely capable of it. His hearers expected a story of how beside himself and all aflame with excitement, he had flown like a storm at the square, cut his way in, slashed right and left, how his saber had tasted flesh and he had fallen exhausted, and so on. And so he told them all that.

In the middle of his story, just as he was saying: "You cannot imagine what a strange frenzy one experiences during an attack," Prince Andrew, whom Boris was expecting, entered the room. Prince Andrew, who liked to help young men, was flattered by being asked for his assistance and being well disposed toward Boris, who had managed to please him the day before, he wished to do what the young man wanted. Having been sent with papers from Kutuzov to the Tsarevich, he looked in on Boris, hoping to find him alone. When he came in and saw an hussar of the line recounting his military exploits (Prince Andrew could not endure that sort of man), he gave Boris a pleasant smile, frowned as with half-closed eyes he looked at Rostov, bowed slightly and wearily, and sat down languidly on the sofa: he felt it unpleasant to have dropped in on bad company.

Rostov flushed up on noticing this, but he did not care, this was a mere stranger. Glancing, however, at Boris, he saw that he too seemed ashamed of the hussar of the line.

In spite of Prince Andrew's disagreeable, ironical tone, in spite of the contempt with which Rostov, from his fighting army point of view, regarded all these little adjutants on the staff of whom the newcomer was evidently one, Rostov felt confused, blushed, and became silent. Boris inquired what news there might be on the staff, and what, without indiscretion, one might ask about our plans.

"We shall probably advance," replied Bolkonski, evidently reluctant to say more in the presence of a stranger.

Berg took the opportunity to ask, with great politeness, whether, as was rumored, the allowance of forage money to captains of companies would be doubled. To this Prince Andrew answered with a smile that he could give no opinion on such an important government order, and Berg laughed gaily.

"As to your business," Prince Andrew continued, addressing Boris, "we will talk of it later" (and he looked round at Rostov). "Come to me after the review and we will do what is possible."

And, having glanced round the room, Prince Andrew turned to Rostov, whose state of unconquerable childish embarrassment now changing to anger he did not condescend to notice, and said: "I think you were talking of the Schon Grabern affair? Were you there?"

"I was there," said Rostov angrily, as if intending to insult the aide-de-camp.

Bolkonski noticed the hussar's state of mind, and it amused him. With a slightly contemptuous smile, he said: "Yes, there are many stories now told about that affair!"

"Yes, stories!" repeated Rostov loudly, looking with eyes suddenly grown furious, now at Boris, now at Bolkonski. "Yes, many stories! But our stories are the stories of men who have been under the enemy's fire! Our stories have some weight, not like the stories of those fellows on the staff who get rewards without doing anything!"

"Of whom you imagine me to be one?" said Prince Andrew, with a quiet and particularly amiable smile.

A strange feeling of exasperation and yet of respect for this man's self-possession mingled at that moment in Rostov's soul.

"I am not talking about you," he said, "I don't know you and, frankly, I don't want to. I am speaking of the staff in general."

"And I will tell you this," Prince Andrew interrupted in a tone of quiet authority, "you wish to insult me, and I am ready to agree with you that it would be very easy to do so if you haven't sufficient self-respect, but admit that the time and place are very badly chosen. In a day or two we shall all have to take part in a greater and more serious duel, and besides, Drubetskoy, who says he is an old friend of yours, is not at all to blame that my face has the misfortune to displease you. However," he added rising, "you know my name and where to find me, but don't forget that I do not regard either myself or you as having been at all insulted, and as a man older than you, my advice is to let the matter drop. Well then, on Friday after the review I shall expect you, Drubetskoy. Au revoir!" exclaimed Prince Andrew, and with a bow to them both he went out.

Only when Prince Andrew was gone did Rostov think of what he ought to have said. And he was still more angry at having omitted to say it. He ordered his horse at once and, coldly taking leave of Boris, rode home. Should he go to headquarters next day and challenge that affected adjutant, or really let the matter drop, was the question

that worried him all the way. He thought angrily of the pleasure he would have at seeing the fright of that small and frail but proud man when covered by his pistol, and then he felt with surprise that of all the men he knew there was none he would so much like to have for a friend as that very adjutant whom he so hated.

CHAPTER VIII

The day after Rostov had been to see Boris, a review was held of the Austrian and Russian troops, both those freshly arrived from Russia and those who had been campaigning under Kutuzov. The two Emperors, the Russian with his heir the Tsarevich, and the Austrian with the Archduke, inspected the allied army of eighty thousand men.

From early morning the smart clean troops were on the move, forming up on the field before the fortress. Now thousands of feet and bayonets moved and halted at the officers' command, turned with banners flying, formed up at intervals, and wheeled round other similar masses of infantry in different uniforms; now was heard the rhythmic beat of hoofs and the jingling of showy cavalry in blue, red, and green braided uniforms, with smartly dressed bandsmen in front mounted on black, roan, or gray horses; then again, spreading out with the brazen clatter of the polished shining cannon that quivered on the gun carriages and with the smell of linstocks, came the artillery which crawled between the infantry and cavalry and took up its appointed position. Not only the generals in full parade uniforms, with their thin or thick waists drawn in to the utmost, their red necks squeezed into their stiff collars, and wearing scarves and all their decorations, not only the elegant, pomaded officers, but every soldier with his freshly washed and shaven face and his weapons clean and polished to the utmost, and every horse groomed till its coat shone like satin and every hair of its wetted mane lay smooth-felt that no small matter was happening, but an important and solemn affair. Every general and every soldier was conscious of his own insignificance, aware of being but a drop in that ocean of men, and yet at the same time was conscious of his strength as a part of that enormous whole.

From early morning strenuous activities and efforts had begun and by ten o'clock all had been brought into due order. The ranks were drawn up on the vast field. The whole army was extended in three lines: the cavalry in front, behind it the artillery, and behind that again the infantry.

A space like a street was left between each two lines of troops. The three parts of that army were sharply distinguished: Kutuzov's fighting army (with the Pavlograds on the right flank of the front); those recently arrived from Russia, both Guards and regiments of the line; and the Austrian troops. But they all stood in the same lines, under one command, and in a like order.

Like wind over leaves ran an excited whisper: "They're coming! They're coming!" Alarmed voices were heard, and a stir of final preparation swept over all the troops.

From the direction of Olmutz in front of them, a group was seen approaching. And at that moment, though the day was still, a light gust of wind blowing over the army slightly stirred the streamers on the lances and the unfolded standards fluttered against their staffs. It looked as if by that slight motion the army itself was expressing its joy at the approach of the Emperors. One voice was heard shouting: "Eyes front!" Then, like the crowing of cocks at sunrise, this was repeated by others from various sides and all became silent.

In the deathlike stillness only the tramp of horses was heard. This was the Emperors' suites. The Emperors rode up to the flank, and the trumpets of the first cavalry regiment played the general march. It seemed as though not the trumpeters were playing, but as if the army itself, rejoicing at the Emperors' approach, had naturally burst into music. Amid these sounds, only the youthful kindly voice of the Emperor Alexander was clearly heard. He gave the words of greeting, and the first regiment roared "Hurrah!" so deafeningly, continuously, and joyfully that the men themselves were awed by their multitude and the immensity of the power they constituted.

Rostov, standing in the front lines of Kutuzov's army which the Tsar approached first, experienced the same feeling as every other man in that army: a feeling of self-forgetfulness, a proud consciousness of might, and a passionate attraction to him who was the cause of this triumph.

He felt that at a single word from that man all this vast mass (and he himself an insignificant atom in it) would go through fire and water, commit crime, die, or perform deeds of highest heroism, and so he could not but tremble and his heart stand still at the imminence of that word.

"Hurrah! Hurrah! Hurrah!" thundered from all sides, one regiment after another greeting the Tsar with the strains of the march, and then "Hurrah!"... Then the general march, and again "Hurrah! Hurrah!" growing ever stronger and fuller and merging into a deafening roar.

Till the Tsar reached it, each regiment in its silence and immobility seemed like a lifeless body, but as soon as he came up it became alive, its thunder joining the roar of the whole line along which he had already passed. Through the terrible and deafening roar of those voices, amid the square masses of troops standing motionless as if turned to stone, hundreds of riders composing the suites moved carelessly but symmetrically and above all freely, and in front of them two men--the Emperors. Upon them the undivided, tensely passionate attention of that whole mass of men was concentrated.

The handsome young Emperor Alexander, in the uniform of the Horse Guards, wearing a cocked hat with its peaks front and back, with his pleasant face and resonant though not loud voice, attracted everyone's attention.

Rostov was not far from the trumpeters, and with his keen sight had recognized the Tsar and watched his approach. When he was within twenty paces, and Nicholas could clearly distinguish every detail of his handsome, happy young face, he experienced a feeling tenderness and ecstasy such as he had never before known. Every trait and every movement of the Tsar's seemed to him enchanting.

Stopping in front of the Pavlograds, the Tsar said something in French to the Austrian Emperor and smiled.

Seeing that smile, Rostov involuntarily smiled himself and felt a still stronger flow of love for his sovereign. He longed to show that love in some way and knowing that this was impossible was ready to cry. The Tsar called the colonel of the regiment and said a few words to him.

"Oh God, what would happen to me if the Emperor spoke to me?" thought Rostov. "I should die of happiness!"

The Tsar addressed the officers also: "I thank you all, gentlemen, I thank you with my whole heart." To Rostov every word sounded like a voice from heaven. How gladly would he have died at once for his Tsar!

"You have earned the St. George's standards and will be worthy of them."

"Oh, to die, to die for him," thought Rostov.

The Tsar said something more which Rostov did not hear, and the soldiers, straining their lungs, shouted "Hurrah!"

Rostov too, bending over his saddle, shouted "Hurrah!" with all his might, feeling that he would like to injure himself by that shout, if only to express his rapture fully.

The Tsar stopped a few minutes in front of the hussars as if undecided.

"How can the Emperor be undecided?" thought Rostov, but then even this indecision appeared to him majestic and enchanting, like everything else the Tsar did.

That hesitation lasted only an instant. The Tsar's foot, in the narrow pointed boot then fashionable, touched the groin of the bobtailed bay mare he rode, his hand in a white glove gathered up the reins, and he moved off accompanied by an irregularly swaying sea of aides-de-camp. Farther and farther he rode away, stopping at other regiments, till at last only his white plumes were visible to Rostov from amid the suites that surrounded the Emperors.

Among the gentlemen of the suite, Rostov noticed Bolkonski, sitting his horse indolently and carelessly. Rostov recalled their quarrel of yesterday and the question presented itself whether he ought or ought not to challenge Bolkonski. "Of course not!" he now thought. "Is it worth thinking or speaking of it at such a moment? At a time of such love, such rapture, and such self-sacrifice, what do any of our quarrels and affronts matter? I love and forgive everybody now."

When the Emperor had passed nearly all the regiments, the troops began a ceremonial march past him, and Rostov on Bedouin, recently purchased from Denisov, rode past too, at the rear of his squadron—that is, alone and in full view of the Emperor.

Before he reached him, Rostov, who was a splendid horseman, spurred Bedouin twice and successfully put him to the showy trot in which the animal went when excited. Bending his foaming muzzle to his chest, his tail extended, Bedouin, as if also conscious of the Emperor's eye upon him, passed splendidly, lifting his feet with a high and graceful action, as if flying through the air without touching the ground.

Rostov himself, his legs well back and his stomach drawn in and feeling himself one with his horse, rode past the Emperor with a frowning but blissful face "like a vewy devil," as Denisov expressed it.

"Fine fellows, the Pavlograds!" remarked the Emperor.

"My God, how happy I should be if he ordered me to leap into the fire this instant!" thought Rostov.

When the review was over, the newly arrived officers, and also Kutuzov's, collected in groups and began to talk about the awards, about the Austrians and their uniforms, about their lines, about Bonaparte, and how badly the latter would fare now, especially if the Essen corps arrived and Prussia took our side.

But the talk in every group was chiefly about the Emperor Alexander. His every word and movement was described with ecstasy.

They all had but one wish: to advance as soon as possible against the enemy under the Emperor's command. Commanded by the Emperor himself they could not fail to vanquish anyone, be it whom it might: so thought Rostov and most of the officers after the review.

All were then more confident of victory than the winning of two battles would have made them.

CHAPTER IX

The day after the review, Boris, in his best uniform and with his comrade Berg's best wishes for success, rode to Olmutz to see Bolkonski, wishing to profit by his friendliness and obtain for himself the best post he could--preferably that of adjutant to some important personage, a position in the army which seemed to him most attractive. "It is all very well for Rostov, whose father sends him ten thousand rubles at a time, to talk about not wishing to cringe to anybody and not be anyone's lackey, but I who have nothing but my brains have to make a career and must not miss opportunities, but must avail myself of them!" he reflected.

He did not find Prince Andrew in Olmutz that day, but the appearance of the town where the headquarters and the diplomatic corps were stationed and the two Emperors were living with their suites, households, and courts only strengthened his desire to belong to that higher world.

He knew no one, and despite his smart Guardsman's uniform, all these exalted personages passing in the streets in their elegant carriages with their plumes, ribbons, and medals, both courtiers and military men, seemed so immeasurably above him, an insignificant officer of the Guards, that they not only did not wish to, but simply could not, be aware of his existence. At the quarters of the commander in chief, Kutuzov, where he inquired for Bolkonski, all the adjutants and even the orderlies looked at him as if they wished to impress on him that a great many officers like him were always coming there and that everybody was heartily sick of them. In spite of this, or rather because of it, next day, November 15, after dinner he again went to Olmutz and, entering the house occupied by Kutuzov, asked for Bolkonski. Prince Andrew was in and Boris was shown into a large hall probably formerly used for dancing, but in which five beds now stood, and furniture of various kinds: a table, chairs, and a clavichord. One adjutant, nearest the door, was sitting at the table in a Persian dressing gown, writing. Another, the red, stout Nesvitski, lay on a bed with his arms under his head, laughing with an officer who had sat down beside him. A third was playing a Viennese waltz on the clavichord, while a fourth, lying on the clavichord, sang the tune. Bolkonski was not there. None of these gentlemen changed his position on seeing Boris. The one who was writing and whom Boris addressed turned round crossly and told him Bolkonski was on duty and that he should go through the door on the left into the reception room if he wished to see him. Boris thanked him and went to the reception room, where he found some ten officers and generals.

When he entered, Prince Andrew, his eyes drooping contemptuously (with that peculiar expression of polite weariness which plainly says, "If it were not my duty I would not talk to you for a moment"), was listening to an old Russian general with decorations, who stood very erect, almost on tiptoe, with a soldier's obsequious expression on his purple face, reporting something.

"Very well, then, be so good as to wait," said Prince Andrew to the general, in Russian, speaking with the French intonation he affected when he wished to speak contemptuously, and noticing Boris, Prince Andrew, paying no more heed to the general who ran after him imploring him to hear something more, nodded and turned to him with a cheerful smile.

At that moment Boris clearly realized what he had before surmised,

that in the army, besides the subordination and discipline prescribed in the military code, which he and the others knew in the regiment, there was another, more important, subordination, which made this tight-laced, purple-faced general wait respectfully while Captain Prince Andrew, for his own pleasure, chose to chat with Lieutenant Drubetskoy. More than ever was Boris resolved to serve in future not according to the written code, but under this unwritten law. He felt now that merely by having been recommended to Prince Andrew he had already risen above the general who at the front had the power to annihilate him, a lieutenant of the Guards. Prince Andrew came up to him and took his hand.

"I am very sorry you did not find me in yesterday. I was fussing about with Germans all day. We went with Weyrother to survey the dispositions. When Germans start being accurate, there's no end to it!"

Boris smiled, as if he understood what Prince Andrew was alluding to as something generally known. But it the first time he had heard Weyrother's name, or even the term "dispositions."

"Well, my dear fellow, so you still want to be an adjutant? I have been thinking about you."

"Yes, I was thinking"--for some reason Boris could not help blushing--"of asking the commander in chief. He has had a letter from Prince Kuragin about me. I only wanted to ask because I fear the Guards won't be in action," he added as if in apology.

"All right, all right. We'll talk it over," replied Prince Andrew. "Only let me report this gentleman's business, and I shall be at your disposal."

While Prince Andrew went to report about the purple-faced general, that gentleman--evidently not sharing Boris' conception of the advantages of the unwritten code of subordination--looked so fixedly at the presumptuous lieutenant who had prevented his finishing what he had to say to the adjutant that Boris felt uncomfortable. He turned away and waited impatiently for Prince Andrew's return from the commander in chief's room.

"You see, my dear fellow, I have been thinking about you," said Prince Andrew when they had gone into the large room where the clavichord was. "It's no use your going to the commander in chief. He would say a lot of pleasant things, ask you to dinner" ("That would not be bad as regards the unwritten code," thought Boris), "but nothing more would come of it. There will soon be a battalion of us aides-de-camp and adjutants! But this is what we'll do: I have a good friend, an adjutant general and an excellent fellow, Prince Dolgorukov; and though you may not know it, the fact is that now Kutuzov with his staff and all of us count for nothing. Everything is now centered round the Emperor. So we will go to Dolgorukov; I have to go there anyhow and I have already spoken to him about you. We shall see whether he cannot attach you to himself or find a place for you somewhere nearer the sun."

Prince Andrew always became specially keen when he had to guide a young man and help him to worldly success. Under cover of obtaining help of this kind for another, which from pride he would never accept for himself, he kept in touch with the circle which confers success and which attracted him. He very readily took up Boris' cause and went with him to Dolgorukov.

It was late in the evening when they entered the palace at Olmutz occupied by the Emperors and their retinues.

That same day a council of war had been held in which all the members of the Hofkriegsrath and both Emperors took part. At that council, contrary to the views of the old generals Kutuzov and

Prince Schwartzenberg, it had been decided to advance immediately and give battle to Bonaparte. The council of war was just over when Prince Andrew accompanied by Boris arrived at the palace to find Dolgorukov. Everyone at headquarters was still under the spell of the day's council, at which the party of the young had triumphed. The voices of those who counseled delay and advised waiting for something else before advancing had been so completely silenced and their arguments confuted by such conclusive evidence of the advantages of attacking that what had been discussed at the council--the coming battle and the victory that would certainly result from it--no longer seemed to be in the future but in the past. All the advantages were on our side. Our enormous forces, undoubtedly superior to Napoleon's, were concentrated in one place, the troops inspired by the Emperors' presence were eager for action. The strategic position where the operations would take place was familiar in all its details to the Austrian General Weyrother: a lucky accident had ordained that the Austrian army should maneuver the previous year on the very fields where the French had now to be fought; the adjacent locality was known and shown in every detail on the maps, and Bonaparte, evidently weakened, was undertaking nothing.

Dolgorukov, one of the warmest advocates of an attack, had just returned from the council, tired and exhausted but eager and proud of the victory that had been gained. Prince Andrew introduced his protege, but Prince Dolgorukov politely and firmly pressing his hand said nothing to Boris and, evidently unable to suppress the thoughts which were uppermost in his mind at that moment, addressed Prince Andrew in French.

"Ah, my dear fellow, what a battle we have gained! God grant that the one that will result from it will be as victorious! However, dear fellow," he said abruptly and eagerly, "I must confess to having been unjust to the Austrians and especially to Weyrother. What exactitude, what minuteness, what knowledge of the locality, what foresight for every eventuality, every possibility even to the smallest detail! No, my dear fellow, no conditions better than our present ones could have been devised. This combination of Austrian precision with Russian valor--what more could be wished for?"

"So the attack is definitely resolved on?" asked Bolkonski.

"And do you know, my dear fellow, it seems to me that Bonaparte has decidedly lost bearings, you know that a letter was received from him today for the Emperor." Dolgorukov smiled significantly.

"Is that so? And what did he say?" inquired Bolkonski.

"What can he say? Tra-di-ri-di-ra and so on... merely to gain time. I tell you he is in our hands, that's certain! But what was most amusing," he continued, with a sudden, good-natured laugh, "was that we could not think how to address the reply! If not as 'Consul' and of course not as 'Emperor,' it seemed to me it should be to 'General Bonaparte.'"

"But between not recognizing him as Emperor and calling him General Bonaparte, there is a difference," remarked Bolkonski.

"That's just it," interrupted Dolgorukov quickly, laughing. "You know Bilibin--he's a very clever fellow. He suggested addressing him as 'Usurper and Enemy of Mankind.'"

Dolgorukov laughed merrily.

"Only that?" said Bolkonski.

"All the same, it was Bilibin who found a suitable form for the address. He is a wise and clever fellow."

"What was it?"

"To the Head of the French Government... Au chef du gouvernement franais," said Dolgorukov, with grave satisfaction. "Good, wasn't it?"

"Yes, but he will dislike it extremely," said Bolkonski.

"Oh yes, very much! My brother knows him, he's dined with him--the present Emperor--more than once in Paris, and tells me he never met a more cunning or subtle diplomatist--you know, a combination of French adroitness and Italian play-acting! Do you know the tale about him and Count Markov? Count Markov was the only man who knew how to handle him. You know the story of the handkerchief? It is delightful!"

And the talkative Dolgorukov, turning now to Boris, now to Prince Andrew, told how Bonaparte wishing to test Markov, our ambassador, purposely dropped a handkerchief in front of him and stood looking at Markov, probably expecting Markov to pick it up for him, and how Markov immediately dropped his own beside it and picked it up without touching Bonaparte's.

"Delightful!" said Bolkonski. "But I have come to you, Prince, as a petitioner on behalf of this young man. You see..." but before Prince Andrew could finish, an aide-de-camp came in to summon Dolgorukov to the Emperor.

"Oh, what a nuisance," said Dolgorukov, getting up hurriedly and pressing the hands of Prince Andrew and Boris. "You know I should be very glad to do all in my power both for you and for this dear young man." Again he pressed the hand of the latter with an expression of good-natured, sincere, and animated levity. "But you see... another time!"

Boris was excited by the thought of being so close to the higher powers as he felt himself to be at that moment. He was conscious that here he was in contact with the springs that set in motion the enormous movements of the mass of which in his regiment he felt himself a tiny, obedient, and insignificant atom. They followed Prince Dolgorukov out into the corridor and met--coming out of the door of the Emperor's room by which Dolgorukov had entered--a short man in civilian clothes with a clever face and sharply projecting jaw which, without spoiling his face, gave him a peculiar vivacity and shiftiness of expression. This short man nodded to Dolgorukov as to an intimate friend and stared at Prince Andrew with cool intensity, walking straight toward him and evidently expecting him to bow or to step out of his way. Prince Andrew did neither: a look of animosity appeared on his face and the other turned away and went down the side of the corridor.

"Who was that?" asked Boris.

"He is one of the most remarkable, but to me most unpleasant of men--the Minister of Foreign Affairs, Prince Adam Czartoryski.... It is such men as he who decide the fate of nations," added Bolkonski with a sigh he could not suppress, as they passed out of the palace.

Next day, the army began its campaign, and up to the very battle of Austerlitz, Boris was unable to see either Prince Andrew or Dolgorukov again and remained for a while with the Ismaylov regiment.

CHAPTER X

At dawn on the sixteenth of November, Denisov's squadron, in which Nicholas Rostov served and which was in Prince Bagration's detachment, moved from the place where it had spent the night, advancing into

action as arranged, and after going behind other columns for about two thirds of a mile was stopped on the highroad. Rostov saw the Cossacks and then the first and second squadrons of hussars and infantry battalions and artillery pass by and go forward and then Generals Bagration and Dolgorukov ride past with their adjutants. All the fear before action which he had experienced as previously, all the inner struggle to conquer that fear, all his dreams of distinguishing himself as a true hussar in this battle, had been wasted. Their squadron remained in reserve and Nicholas Rostov spent that day in a dull and wretched mood. At nine in the morning, he heard firing in front and shouts of hurrah, and saw wounded being brought back (there were not many of them), and at last he saw how a whole detachment of French cavalry was brought in, convoyed by a sonnya of Cossacks. Evidently the affair was over and, though not big, had been a successful engagement. The men and officers returning spoke of a brilliant victory, of the occupation of the town of Wischau and the capture of a whole French squadron. The day was bright and sunny after a sharp night frost, and the cheerful glitter of that autumn day was in keeping with the news of victory which was conveyed, not only by the tales of those who had taken part in it, but also by the joyful expression on the faces of soldiers, officers, generals, and adjutants, as they passed Rostov going or coming. And Nicholas, who had vainly suffered all the dread that precedes a battle and had spent that happy day in inactivity, was all the more depressed.

"Come here, Wostov. Let's dwink to dwown our gwief!" shouted Denisov, who had settled down by the roadside with a flask and some food.

The officers gathered round Denisov's canteen, eating and talking.

"There! They are bringing another!" cried one of the officers, indicating a captive French dragoon who was being brought in on foot by two Cossacks.

One of them was leading by the bridle a fine large French horse he had taken from the prisoner.

"Sell us that horse!" Denisov called out to the Cossacks.

"If you like, your honor!"

The officers got up and stood round the Cossacks and their prisoner. The French dragoon was a young Alsatian who spoke French with a German accent. He was breathless with agitation, his face was red, and when he heard some French spoken he at once began speaking to the officers, addressing first one, then another. He said he would not have been taken, it was not his fault but the corporal's who had sent him to seize some horsecloths, though he had told him the Russians were there. And at every word he added: "But don't hurt my little horse!" and stroked the animal. It was plain that he did not quite grasp where he was. Now he excused himself for having been taken prisoner and now, imagining himself before his own officers, insisted on his soldierly discipline and zeal in the service. He brought with him into our rearguard all the freshness of atmosphere of the French army, which was so alien to us.

The Cossacks sold the horse for two gold pieces, and Rostov, being the richest of the officers now that he had received his money, bought it.

"But don't hurt my little horse!" said the Alsatian good-naturedly to Rostov when the animal was handed over to the hussar.

Rostov smilingly reassured the dragoon and gave him money.

"Alley! Alley!" said the Cossack, touching the prisoner's arm to make him go on.

"The Emperor! The Emperor!" was suddenly heard among the hussars.

All began to run and bustle, and Rostov saw coming up the road behind him several riders with white plumes in their hats. In a moment everyone was in his place, waiting.

Rostov did not know or remember how he ran to his place and mounted. Instantly his regret at not having been in action and his dejected mood amid people of whom he was weary had gone, instantly every thought of himself had vanished. He was filled with happiness at his nearness to the Emperor. He felt that this nearness by itself made up to him for the day he had lost. He was happy as a lover when the longed-for moment of meeting arrives. Not daring to look round and without looking round, he was ecstatically conscious of his approach. He felt it not only from the sound of the hoofs of the approaching cavalcade, but because as he drew near everything grew brighter, more joyful, more significant, and more festive around him. Nearer and nearer to Rostov came that sun shedding beams of mild and majestic light around, and already he felt himself enveloped in those beams, he heard his voice, that kindly, calm, and majestic voice that was yet so simple! And as if in accord with Rostov's feeling, there was a deathly stillness amid which was heard the Emperor's voice.

"The Pavlograd hussars?" he inquired.

"The reserves, sire!" replied a voice, a very human one compared to that which had said: "The Pavlograd hussars?"

The Emperor drew level with Rostov and halted. Alexander's face was even more beautiful than it had been three days before at the review. It shone with such gaiety and youth, such innocent youth, that it suggested the liveliness of a fourteen-year-old boy, and yet it was the face of the majestic Emperor. Casually, while surveying the squadron, the Emperor's eyes met Rostov's and rested on them for not more than two seconds. Whether or no the Emperor understood what was going on in Rostov's soul (it seemed to Rostov that he understood everything), at any rate his light-blue eyes gazed for about two seconds into Rostov's face. A gentle, mild light poured from them. Then all at once he raised his eyebrows, abruptly touched his horse with his left foot, and galloped on.

The younger Emperor could not restrain his wish to be present at the battle and, in spite of the remonstrances of his courtiers, at twelve o'clock left the third column with which he had been and galloped toward the vanguard. Before he came up with the hussars, several adjutants met him with news of the successful result of the action.

This battle, which consisted in the capture of a French squadron, was represented as a brilliant victory over the French, and so the Emperor and the whole army, especially while the smoke hung over the battlefield, believed that the French had been defeated and were retreating against their will. A few minutes after the Emperor had passed, the Pavlograd division was ordered to advance. In Wischau itself, a petty German town, Rostov saw the Emperor again. In the market place, where there had been some rather heavy firing before the Emperor's arrival, lay several killed and wounded soldiers whom there had not been time to move. The Emperor, surrounded by his suite of officers and courtiers, was riding a bobtailed chestnut mare, a different one from that which he had ridden at the review, and bending to one side he gracefully held a gold lorgnette to his eyes and looked at a soldier who lay prone, with blood on his uncovered head. The wounded soldier was so dirty, coarse, and revolting that his proximity to the Emperor shocked Rostov. Rostov saw how the Emperor's rather round shoulders shuddered as if a cold shiver had run down them, how his left foot began convulsively tapping the horse's side with the spur, and how the well-trained horse looked round unconcerned and did not stir. An adjutant, dismounting, lifted the soldier under the arms to place him on a stretcher that had been brought. The soldier groaned.

"Gently, gently! Can't you do it more gently?" said the Emperor apparently suffering more than the dying soldier, and he rode away.

Rostov saw tears filling the Emperor's eyes and heard him, as he was riding away, say to Czartoryski: "What a terrible thing war is: what a terrible thing! Quelle terrible chose que la guerre!"

The troops of the vanguard were stationed before Wischau, within sight of the enemy's lines, which all day long had yielded ground to us at the least firing. The Emperor's gratitude was announced to the vanguard, rewards were promised, and the men received a double ration of vodka. The campfires crackled and the soldiers' songs resounded even more merrily than on the previous night. Denisov celebrated his promotion to the rank of major, and Rostov, who had already drunk enough, at the end of the feast proposed the Emperor's health. "Not 'our Sovereign, the Emperor,' as they say at official dinners," said he, "but the health of our Sovereign, that good, enchanting, and great man! Let us drink to his health and to the certain defeat of the French!"

"If we fought before," he said, "not letting the French pass, as at Schon Grabern, what shall we not do now when he is at the front? We will all die for him gladly! Is it not so, gentlemen? Perhaps I am not saying it right, I have drunk a good deal--but that is how I feel, and so do you too! To the health of Alexander the First! Hurrah!"

"Hurrah!" rang the enthusiastic voices of the officers.

And the old cavalry captain, Kirsten, shouted enthusiastically and no less sincerely than the twenty-year-old Rostov.

When the officers had emptied and smashed their glasses, Kirsten filled others and, in shirt sleeves and breeches, went glass in hand to the soldiers' bonfires and with his long gray mustache, his white chest showing under his open shirt, he stood in a majestic pose in the light of the campfire, waving his uplifted arm.

"Lads! here's to our Sovereign, the Emperor, and victory over our enemies! Hurrah!" he exclaimed in his dashing, old, hussar's baritone.

The hussars crowded round and responded heartily with loud shouts.

Late that night, when all had separated, Denisov with his short hand patted his favorite, Rostov, on the shoulder.

"As there's no one to fall in love with on campaign, he's fallen in love with the Tsar," he said.

"Denisov, don't make fun of it!" cried Rostov. "It is such a lofty, beautiful feeling, such a..."

"I believe it, I believe it, fwieand, and I share and appwove..."

"No, you don't understand!"

And Rostov got up and went wandering among the campfires, dreaming of what happiness it would be to die--not in saving the Emperor's life (he did not even dare to dream of that), but simply to die before his eyes. He really was in love with the Tsar and the glory of the Russian arms and the hope of future triumph. And he was not the only man to experience that feeling during those memorable days preceding the battle of Austerlitz: nine tenths of the men in the Russian army were then in love, though less ecstatically, with their Tsar and the glory of the Russian arms.

CHAPTER XI

The next day the Emperor stopped at Wischau, and Villier, his physician, was repeatedly summoned to see him. At headquarters and among the troops near by the news spread that the Emperor was unwell. He ate nothing and had slept badly that night, those around him reported. The cause of this indisposition was the strong impression made on his sensitive mind by the sight of the killed and wounded.

At daybreak on the seventeenth, a French officer who had come with a flag of truce, demanding an audience with the Russian Emperor, was brought into Wischau from our outposts. This officer was Savary. The Emperor had only just fallen asleep and so Savary had to wait. At midday he was admitted to the Emperor, and an hour later he rode off with Prince Dolgorukov to the advanced post of the French army.

It was rumored that Savary had been sent to propose to Alexander a meeting with Napoleon. To the joy and pride of the whole army, a personal interview was refused, and instead of the Sovereign, Prince Dolgorukov, the victor at Wischau, was sent with Savary to negotiate with Napoleon if, contrary to expectations, these negotiations were actuated by a real desire for peace.

Toward evening Dolgorukov came back, went straight to the Tsar, and remained alone with him for a long time.

On the eighteenth and nineteenth of November, the army advanced two days' march and the enemy's outposts after a brief interchange of shots retreated. In the highest army circles from midday on the nineteenth, a great, excitedly bustling activity began which lasted till the morning of the twentieth, when the memorable battle of Austerlitz was fought.

Till midday on the nineteenth, the activity--the eager talk, running to and fro, and dispatching of adjutants--was confined to the Emperor's headquarters. But on the afternoon of that day, this activity reached Kutuzov's headquarters and the staffs of the commanders of columns. By evening, the adjutants had spread it to all ends and parts of the army, and in the night from the nineteenth to the twentieth, the whole eighty thousand allied troops rose from their bivouacs to the hum of voices, and the army swayed and started in one enormous mass six miles long.

The concentrated activity which had begun at the Emperor's headquarters in the morning and had started the whole movement that followed was like the first movement of the main wheel of a large tower clock. One wheel slowly moved, another was set in motion, and a third, and wheels began to revolve faster and faster, levers and cogwheels to work, chimes to play, figures to pop out, and the hands to advance with regular motion as a result of all that activity.

Just as in the mechanism of a clock, so in the mechanism of the military machine, an impulse once given leads to the final result; and just as indifferently quiescent till the moment when motion is transmitted to them are the parts of the mechanism which the impulse has not yet reached. Wheels creak on their axles as the cogs engage one another and the revolving pulleys whirr with the rapidity of their movement, but a neighboring wheel is as quiet and motionless as though it were prepared to remain so for a hundred years; but the moment comes when the lever catches it and obeying the impulse that wheel begins to creak and joins in the common motion the result and aim of which are beyond its ken.

Just as in a clock, the result of the complicated motion of innumerable wheels and pulleys is merely a slow and regular movement of the hands which show the time, so the result of all the complicated human activities of 160,000 Russians and French--all their passions, desires, remorse, humiliations, sufferings, outbursts of pride,

fear, and enthusiasm--was only the loss of the battle of Austerlitz, the so-called battle of the three Emperors--that is to say, a slow movement of the hand on the dial of human history.

Prince Andrew was on duty that day and in constant attendance on the commander in chief.

At six in the evening, Kutuzov went to the Emperor's headquarters and after staying but a short time with the Tsar went to see the grand marshal of the court, Count Tolstoy.

Bolkonski took the opportunity to go in to get some details of the coming action from Dolgorukov. He felt that Kutuzov was upset and dissatisfied about something and that at headquarters they were dissatisfied with him, and also that at the Emperor's headquarters everyone adopted toward him the tone of men who know something others do not know: he therefore wished to speak to Dolgorukov.

"Well, how d'you do, my dear fellow?" said Dolgorukov, who was sitting at tea with Bilibin. "The fete is for tomorrow. How is your old fellow? Out of sorts?"

"I won't say he is out of sorts, but I fancy he would like to be heard."

"But they heard him at the council of war and will hear him when he talks sense, but to temporize and wait for something now when Bonaparte fears nothing so much as a general battle is impossible."

"Yes, you have seen him?" said Prince Andrew. "Well, what is Bonaparte like? How did he impress you?"

"Yes, I saw him, and am convinced that he fears nothing so much as a general engagement," repeated Dolgorukov, evidently prizing this general conclusion which he had arrived at from his interview with Napoleon. "If he weren't afraid of a battle why did he ask for that interview? Why negotiate, and above all why retreat, when to retreat is so contrary to his method of conducting war? Believe me, he is afraid, afraid of a general battle. His hour has come! Mark my words!"

"But tell me, what is he like, eh?" said Prince Andrew again.

"He is a man in a gray overcoat, very anxious that I should call him 'Your Majesty,' but who, to his chagrin, got no title from me! That's the sort of man he is, and nothing more," replied Dolgorukov, looking round at Bilibin with a smile.

"Despite my great respect for old Kutuzov," he continued, "we should be a nice set of fellows if we were to wait about and so give him a chance to escape, or to trick us, now that we certainly have him in our hands! No, we mustn't forget Suvorov and his rule--not to put yourself in a position to be attacked, but yourself to attack. Believe me in war the energy of young men often shows the way better than all the experience of old Cunctators."

"But in what position are we going to attack him? I have been at the outposts today and it is impossible to say where his chief forces are situated," said Prince Andrew.

He wished to explain to Dolgorukov a plan of attack he had himself formed.

"Oh, that is all the same," Dolgorukov said quickly, and getting up he spread a map on the table. "All eventualities have been foreseen. If he is standing before Brunn..."

And Prince Dolgorukov rapidly but indistinctly explained Weyrother's plan of a flanking movement.

Prince Andrew began to reply and to state his own plan, which

might have been as good as Weyrother's, but for the disadvantage that Weyrother's had already been approved. As soon as Prince Andrew began to demonstrate the defects of the latter and the merits of his own plan, Prince Dolgorukov ceased to listen to him and gazed absent-mindedly not at the map, but at Prince Andrew's face.

"There will be a council of war at Kutuzov's tonight, though; you can say all this there," remarked Dolgorukov.

"I will do so," said Prince Andrew, moving away from the map.

"Whatever are you bothering about, gentlemen?" said Bilibin, who, till then, had listened with an amused smile to their conversation and now was evidently ready with a joke. "Whether tomorrow brings victory or defeat, the glory of our Russian arms is secure. Except your Kutuzov, there is not a single Russian in command of a column! The commanders are: Herr General Wimpfen, le Comte de Langeron, le Prince de Lichtenstein, le Prince, de Hohenlohe, and finally Prishprish, and so on like all those Polish names."

"Be quiet, backbiter!" said Dolgorukov. "It is not true; there are now two Russians, Miloradovich, and Dokhturov, and there would be a third, Count Arakcheev, if his nerves were not too weak."

"However, I think General Kutuzov has come out," said Prince Andrew. "I wish you good luck and success, gentlemen!" he added and went out after shaking hands with Dolgorukov and Bilibin.

On the way home, Prince Andrew could not refrain from asking Kutuzov, who was sitting silently beside him, what he thought of tomorrow's battle.

Kutuzov looked sternly at his adjutant and, after a pause, replied: "I think the battle will be lost, and so I told Count Tolstoy and asked him to tell the Emperor. What do you think he replied? 'But, my dear general, I am engaged with rice and cutlets, look after military matters yourself!' Yes... That was the answer I got!"

CHAPTER XII

Shortly after nine o'clock that evening, Weyrother drove with his plans to Kutuzov's quarters where the council of war was to be held. All the commanders of columns were summoned to the commander in chief's and with the exception of Prince Bagration, who declined to come, were all there at the appointed time.

Weyrother, who was in full control of the proposed battle, by his eagerness and briskness presented a marked contrast to the dissatisfied and drowsy Kutuzov, who reluctantly played the part of chairman and president of the council of war. Weyrother evidently felt himself to be at the head of a movement that had already become unrestrainable. He was like a horse running downhill harnessed to a heavy cart. Whether he was pulling it or being pushed by it he did not know, but rushed along at headlong speed with no time to consider what this movement might lead to. Weyrother had been twice that evening to the enemy's picket line to reconnoiter personally, and twice to the Emperors, Russian and Austrian, to report and explain, and to his headquarters where he had dictated the dispositions in German, and now, much exhausted, he arrived at Kutuzov's.

He was evidently so busy that he even forgot to be polite to the commander in chief. He interrupted him, talked rapidly and indistinctly, without looking at the man he was addressing, and did not reply to questions put to him. He was bespattered with mud and had a pitiful, weary, and distracted air, though at the same time he was

haughty and self-confident.

Kutuzov was occupying a nobleman's castle of modest dimensions near Ostralitz. In the large drawing room which had become the commander in chief's office were gathered Kutuzov himself, Weyrother, and the members of the council of war. They were drinking tea, and only awaited Prince Bagration to begin the council. At last Bagration's orderly came with the news that the prince could not attend. Prince Andrew came in to inform the commander in chief of this and, availing himself of permission previously given him by Kutuzov to be present at the council, he remained in the room.

"Since Prince Bagration is not coming, we may begin," said Weyrother, hurriedly rising from his seat and going up to the table on which an enormous map of the environs of Brunn was spread out.

Kutuzov, with his uniform unbuttoned so that his fat neck bulged over his collar as if escaping, was sitting almost asleep in a low chair, with his podgy old hands resting symmetrically on its arms. At the sound of Weyrother's voice, he opened his one eye with an effort.

"Yes, yes, if you please! It is already late," said he, and nodding his head he let it droop and again closed his eye.

If at first the members of the council thought that Kutuzov was pretending to sleep, the sounds his nose emitted during the reading that followed proved that the commander in chief at that moment was absorbed by a far more serious matter than a desire to show his contempt for the dispositions or anything else--he was engaged in satisfying the irresistible human need for sleep. He really was asleep. Weyrother, with the gesture of a man too busy to lose a moment, glanced at Kutuzov and, having convinced himself that he was asleep, took up a paper and in a loud, monotonous voice began to read out the dispositions for the impending battle, under a heading which he also read out:

"Dispositions for an attack on the enemy position behind Kobelnitz and Sokolnitz, November 30, 1805."

The dispositions were very complicated and difficult. They began as follows:

"As the enemy's left wing rests on wooded hills and his right extends along Kobelnitz and Sokolnitz behind the ponds that are there, while we, on the other hand, with our left wing by far outflank his right, it is advantageous to attack the enemy's latter wing especially if we occupy the villages of Sokolnitz and Kobelnitz, whereby we can both fall on his flank and pursue him over the plain between Schlappanitz and the Thuerassa forest, avoiding the defiles of Schlappanitz and Bellowitz which cover the enemy's front. For this object it is necessary that... The first column marches... The second column marches... The third column marches..." and so on, read Weyrother.

The generals seemed to listen reluctantly to the difficult dispositions. The tall, fair-haired General Buxhowden stood, leaning his back against the wall, his eyes fixed on a burning candle, and seemed not to listen or even to wish to be thought to listen. Exactly opposite Weyrother, with his glistening wide-open eyes fixed upon him and his mustache twisted upwards, sat the ruddy Miloradovich in a military pose, his elbows turned outwards, his hands on his knees, and his shoulders raised. He remained stubbornly silent, gazing at Weyrother's face, and only turned away his eyes when the Austrian chief of staff finished reading. Then Miloradovich looked round significantly at the other generals. But one could not tell from that significant look whether he agreed or disagreed and was satisfied or not with the arrangements. Next to Weyrother sat Count Langeron who, with a subtle smile that never left his typically southern French

face during the whole time of the reading, gazed at his delicate fingers which rapidly twirled by its corners a gold snuffbox on which was a portrait. In the middle of one of the longest sentences, he stopped the rotary motion of the snuffbox, raised his head, and with inimical politeness lurking in the corners of his thin lips interrupted Weyrother, wishing to say something. But the Austrian general, continuing to read, frowned angrily and jerked his elbows, as if to say: "You can tell me your views later, but now be so good as to look at the map and listen." Langeron lifted his eyes with an expression of perplexity, turned round to Miloradovich as if seeking an explanation, but meeting the latter's impressive but meaningless gaze drooped his eyes sadly and again took to twirling his snuffbox.

"A geography lesson!" he muttered as if to himself, but loud enough to be heard.

Przebyszewski, with respectful but dignified politeness, held his hand to his ear toward Weyrother, with the air of a man absorbed in attention. Dohkturov, a little man, sat opposite Weyrother, with an assiduous and modest mien, and stooping over the outspread map conscientiously studied the dispositions and the unfamiliar locality. He asked Weyrother several times to repeat words he had not clearly heard and the difficult names of villages. Weyrother complied and Dohkturov noted them down.

When the reading which lasted more than an hour was over, Langeron again brought his snuffbox to rest and, without looking at Weyrother or at anyone in particular, began to say how difficult it was to carry out such a plan in which the enemy's position was assumed to be known, whereas it was perhaps not known, since the enemy was in movement. Langeron's objections were valid but it was obvious that their chief aim was to show General Weyrother--who had read his dispositions with as much self-confidence as if he were addressing school children--that he had to do, not with fools, but with men who could teach him something in military matters.

When the monotonous sound of Weyrother's voice ceased, Kutuzov opened his eye as a miller wakes up when the soporific drone of the mill wheel is interrupted. He listened to what Langeron said, as if remarking, "So you are still at that silly business!" quickly closed his eye again, and let his head sink still lower.

Langeron, trying as virulently as possible to sting Weyrother's vanity as author of the military plan, argued that Bonaparte might easily attack instead of being attacked, and so render the whole of this plan perfectly worthless. Weyrother met all objections with a firm and contemptuous smile, evidently prepared beforehand to meet all objections be they what they might.

"If he could attack us, he would have done so today," said he.

"So you think he is powerless?" said Langeron.

"He has forty thousand men at most," replied Weyrother, with the smile of a doctor to whom an old wife wishes to explain the treatment of a case.

"In that case he is inviting his doom by awaiting our attack," said Langeron, with a subtly ironical smile, again glancing round for support to Miloradovich who was near him.

But Miloradovich was at that moment evidently thinking of anything rather than of what the generals were disputing about.

"Ma foi!" said he, "tomorrow we shall see all that on the battlefield."

Weyrother again gave that smile which seemed to say that to him it was strange and ridiculous to meet objections from Russian generals and to have to prove to them what he had not merely convinced

himself of, but had also convinced the sovereign Emperors of.

"The enemy has quenched his fires and a continual noise is heard from his camp," said he. "What does that mean? Either he is retreating, which is the only thing we need fear, or he is changing his position." (He smiled ironically.) "But even if he also took up a position in the Thuerassa, he merely saves us a great deal of trouble and all our arrangements to the minutest detail remain the same."

"How is that?..." began Prince Andrew, who had for long been waiting an opportunity to express his doubts.

Kutuzov here woke up, coughed heavily, and looked round at the generals.

"Gentlemen, the dispositions for tomorrow--or rather for today, for it is past midnight--cannot now be altered," said he. "You have heard them, and we shall all do our duty. But before a battle, there is nothing more important..." he paused, "than to have a good sleep."

He moved as if to rise. The generals bowed and retired. It was past midnight. Prince Andrew went out.

The council of war, at which Prince Andrew had not been able to express his opinion as he had hoped to, left on him a vague and uneasy impression. Whether Dolgorukov and Weyrother, or Kutuzov, Langeron, and the others who did not approve of the plan of attack, were right--he did not know. "But was it really not possible for Kutuzov to state his views plainly to the Emperor? Is it possible that on account of court and personal considerations tens of thousands of lives, and my life, my life," he thought, "must be risked?"

"Yes, it is very likely that I shall be killed tomorrow," he thought. And suddenly, at this thought of death, a whole series of most distant, most intimate, memories rose in his imagination: he remembered his last parting from his father and his wife; he remembered the days when he first loved her. He thought of her pregnancy and felt sorry for her and for himself, and in a nervously emotional and softened mood he went out of the hut in which he was billeted with Nesvitski and began to walk up and down before it.

The night was foggy and through the fog the moonlight gleamed mysteriously. "Yes, tomorrow, tomorrow!" he thought. "Tomorrow everything may be over for me! All these memories will be no more, none of them will have any meaning for me. Tomorrow perhaps, even certainly, I have a presentiment that for the first time I shall have to show all I can do." And his fancy pictured the battle, its loss, the concentration of fighting at one point, and the hesitation of all the commanders. And then that happy moment, that Toulon for which he had so long waited, presents itself to him at last. He firmly and clearly expresses his opinion to Kutuzov, to Weyrother, and to the Emperors. All are struck by the justness of his views, but no one undertakes to carry them out, so he takes a regiment, a division-stipulates that no one is to interfere with his arrangements--leads his division to the decisive point, and gains the victory alone. "But death and suffering?" suggested another voice. Prince Andrew, however, did not answer that voice and went on dreaming of his triumphs. The dispositions for the next battle are planned by him alone. Nominally he is only an adjutant on Kutuzov's staff, but he does everything alone. The next battle is won by him alone. Kutuzov is removed and he is appointed... "Well and then?" asked the other voice. "If before that you are not ten times wounded, killed, or betrayed, well... what then?..." "Well then," Prince Andrew answered himself, "I don't know what will happen and don't want to know, and can't, but if I want this--want glory, want to be known to men, want to be loved by them, it is not my fault that I want it and want nothing but that and live only for that. Yes, for that alone! I shall never tell anyone, but, oh God! what am I to do if I love nothing but fame

and men's esteem? Death, wounds, the loss of family--I fear nothing. And precious and dear as many persons are to me--father, sister, wife--those dearest to me--yet dreadful and unnatural as it seems, I would give them all at once for a moment of glory, of triumph over men, of love from men I don't know and never shall know, for the love of these men here," he thought, as he listened to voices in Kutuzov's courtyard. The voices were those of the orderlies who were packing up; one voice, probably a coachman's, was teasing Kutuzov's old cook whom Prince Andrew knew, and who was called Tit. He was saying, "Tit, I say, Tit!"

"Well?" returned the old man.

"Go, Tit, thresh a bit!" said the wag.

"Oh, go to the devil!" called out a voice, drowned by the laughter of the orderlies and servants.

"All the same, I love and value nothing but triumph over them all, I value this mystic power and glory that is floating here above me in this mist!"

CHAPTER XIII

That same night, Rostov was with a platoon on skirmishing duty in front of Bagration's detachment. His hussars were placed along the line in couples and he himself rode along the line trying to master the sleepiness that kept coming over him. An enormous space, with our army's campfires dimly glowing in the fog, could be seen behind him; in front of him was misty darkness. Rostov could see nothing, peer as he would into that foggy distance: now something gleamed gray, now there was something black, now little lights seemed to glimmer where the enemy ought to be, now he fancied it was only something in his own eyes. His eyes kept closing, and in his fancy appeared--now the Emperor, now Denisov, and now Moscow memories--and he again hurriedly opened his eyes and saw close before him the head and ears of the horse he was riding, and sometimes, when he came within six paces of them, the black figures of hussars, but in the distance was still the same misty darkness. "Why not?... It might easily happen," thought Rostov, "that the Emperor will meet me and give me an order as he would to any other officer; he'll say: 'Go and find out what's there.' There are many stories of his getting to know an officer in just such a chance way and attaching him to himself! What if he gave me a place near him? Oh, how I would guard him, how I would tell him the truth, how I would unmask his deceivers!" And in order to realize vividly his love devotion to the sovereign, Rostov pictured to himself an enemy or a deceitful German, whom he would not only kill with pleasure but whom he would slap in the face before the Emperor. Suddenly a distant shout aroused him. He started and opened his eyes.

"Where am I? Oh yes, in the skirmishing line... pass and watchword--shaft, Olmutz. What a nuisance that our squadron will be in reserve tomorrow," he thought. "I'll ask leave to go to the front, this may be my only chance of seeing the Emperor. It won't be long now before I am off duty. I'll take another turn and when I get back I'll go to the general and ask him." He readjusted himself in the saddle and touched up his horse to ride once more round his hussars. It seemed to him that it was getting lighter. To the left he saw a sloping descent lit up, and facing it a black knoll that seemed as steep as a wall. On this knoll there was a white patch that Rostov could not at all make out: was it a glade in the wood lit up by the moon, or some unmelted snow, or some white houses? He even thought something moved on that white spot. "I expect it's snow... that spot... a spot--une tache," he thought. "There now... it's not a tache... Natasha... sister, black eyes... Na... tasha... (Won't she be

surprised when I tell her how I've seen the Emperor?) Natasha... take my sabretache...""Keep to the right, your honor, there are bushes here," came the voice of an hussar, past whom Rostov was riding in the act of falling asleep. Rostov lifted his head that had sunk almost to his horse's mane and pulled up beside the hussar. He was succumbing to irresistible, youthful, childish drowsiness. "But what was I thinking? I mustn't forget. How shall I speak to the Emperor? No, that's not it--that's tomorrow. Oh yes! Natasha... sabretache... saber them...Whom? The hussars... Ah, the hussars with mustaches. Along the Tverskaya Street rode the hussar with mustaches... I thought about him too, just opposite Guryev's house... Old Guryev.... Oh, but Denisov's a fine fellow. But that's all nonsense. The chief thing is that the Emperor is here. How he looked at me and wished to say something, but dared not.... No, it was I who dared not. But that's nonsense, the chief thing is not to forget the important thing I was thinking of. Yes, Na-tasha, sabretache, oh, yes, yes! That's right!" And his head once more sank to his horse's neck. All at once it seemed to him that he was being fired at. "What? What? What?... Cut them down! What?..." said Rostov, waking up. At the moment he opened his eyes he heard in front of him, where the enemy was, the long-drawn shouts of thousands of voices. His horse and the horse of the hussar near him pricked their ears at these shouts. Over there, where the shouting came from, a fire flared up and went out again, then another, and all along the French line on the hill fires flared up and the shouting grew louder and louder. Rostov could hear the sound of French words but could not distinguish them. The din of many voices was too great; all he could hear was: "ahahah!" and "rrrrr!"

"What's that? What do you make of it?" said Rostov to the hussar beside him. "That must be the enemy's camp!"

The hussar did not reply.

"Why, don't you hear it?" Rostov asked again, after waiting for a reply.

"Who can tell, your honor?" replied the hussar reluctantly.

"From the direction, it must be the enemy," repeated Rostov.

"It may be he or it may be nothing," muttered the hussar. "It's dark... Steady!" he cried to his fidgeting horse.

Rostov's horse was also getting restive: it pawed the frozen ground, pricking its ears at the noise and looking at the lights. The shouting grew still louder and merged into a general roar that only an army of several thousand men could produce. The lights spread farther and farther, probably along the line of the French camp. Rostov no longer wanted to sleep. The gay triumphant shouting of the enemy army had a stimulating effect on him. "Vive l'Empereur! L'Empereur!" he now heard distinctly.

"They can't be far off, probably just beyond the stream," he said to the hussar beside him.

The hussar only sighed without replying and coughed angrily. The sound of horse's hoofs approaching at a trot along the line of hussars was heard, and out of the foggy darkness the figure of a sergeant of hussars suddenly appeared, looming huge as an elephant.

"Your honor, the generals!" said the sergeant, riding up to Rostov.

Rostov, still looking round toward the fires and the shouts, rode with the sergeant to meet some mounted men who were riding along the line. One was on a white horse. Prince Bagration and Prince Dolgorukov with their adjutants had come to witness the curious phenomenon of the lights and shouts in the enemy's camp. Rostov rode up to Bagration, reported to him, and then joined the adjutants listening to what the generals were saying.

"Believe me," said Prince Dolgorukov, addressing Bagration, "it is nothing but a trick! He has retreated and ordered the rearguard to kindle fires and make a noise to deceive us."

"Hardly," said Bagration. "I saw them this evening on that knoll; if they had retreated they would have withdrawn from that too.... Officer!" said Bagration to Rostov, "are the enemy's skirmishers still there?"

"They were there this evening, but now I don't know, your excellency. Shall I go with some of my hussars to see?" replied Rostov.

Bagration stopped and, before replying, tried to see Rostov's face in the mist.

"Well, go and see," he said, after a pause.

"Yes, sir."

Rostov spurred his horse, called to Sergeant Fedchenko and two other hussars, told them to follow him, and trotted downhill in the direction from which the shouting came. He felt both frightened and pleased to be riding alone with three hussars into that mysterious and dangerous misty distance where no one had been before him. Bagration called to him from the hill not to go beyond the stream, but Rostov pretended not to hear him and did not stop but rode on and on, continually mistaking bushes for trees and gullies for men and continually discovering his mistakes. Having descended the hill at a trot, he no longer saw either our own or the enemy's fires, but heard the shouting of the French more loudly and distinctly. In the valley he saw before him something like a river, but when he reached it he found it was a road. Having come out onto the road he reined in his horse, hesitating whether to ride along it or cross it and ride over the black field up the hillside. To keep to the road which gleamed white in the mist would have been safer because it would be easier to see people coming along it. "Follow me!" said he, crossed the road, and began riding up the hill at a gallop toward the point where the French pickets had been standing that evening.

"Your honor, there he is!" cried one of the hussars behind him. And before Rostov had time to make out what the black thing was that had suddenly appeared in the fog, there was a flash, followed by a report, and a bullet whizzing high up in the mist with a plaintive sound passed out of hearing. Another musket missed fire but flashed in the pan. Rostov turned his horse and galloped back. Four more reports followed at intervals, and the bullets passed somewhere in the fog singing in different tones. Rostov reined in his horse, whose spirits had risen, like his own, at the firing, and went back at a footpace. "Well, some more! Some more!" a merry voice was saying in his soul. But no more shots came.

Only when approaching Bagration did Rostov let his horse gallop again, and with his hand at the salute rode up to the general.

Dolgorukov was still insisting that the French had retreated and had only lit fires to deceive us.

"What does that prove?" he was saying as Rostov rode up. "They might retreat and leave the pickets."

"It's plain that they have not all gone yet, Prince," said Bagration. "Wait till tomorrow morning, we'll find out everything tomorrow."

"The picket is still on the hill, your excellency, just where it was in the evening," reported Rostov, stooping forward with his hand at the salute and unable to repress the smile of delight induced by his ride and especially by the sound of the bullets.

"Very good, very good," said Bagration. "Thank you, officer."

"Your excellency," said Rostov, "may I ask a favor?"

"What is it?"

"Tomorrow our squadron is to be in reserve. May I ask to be attached to the first squadron?"

"What's your name?"

"Count Rostov."

"Oh, very well, you may stay in attendance on me."

"Count Ilya Rostov's son?" asked Dolgorukov.

But Rostov did not reply.

"Then I may reckon on it, your excellency?"

"I will give the order."

"Tomorrow very likely I may be sent with some message to the Emperor," thought Rostov.

"Thank God!"

The fires and shouting in the enemy's army were occasioned by the fact that while Napoleon's proclamation was being read to the troops the Emperor himself rode round his bivouacs. The soldiers, on seeing him, lit wisps of straw and ran after him, shouting, "Vive l'Empereur!" Napoleon's proclamation was as follows:

Soldiers! The Russian army is advancing against you to avenge the Austrian army of Ulm. They are the same battalions you broke at Hollabrunn and have pursued ever since to this place. The position we occupy is a strong one, and while they are marching to go round me on the right they will expose a flank to me. Soldiers! I will myself direct your battalions. I will keep out of fire if you with your habitual valor carry disorder and confusion into the enemy's ranks, but should victory be in doubt, even for a moment, you will see your Emperor exposing himself to the first blows of the enemy, for there must be no doubt of victory, especially on this day when what is at stake is the honor of the French infantry, so necessary to the honor of our nation.

Do not break your ranks on the plea of removing the wounded! Let every man be fully imbued with the thought that we must defeat these hirelings of England, inspired by such hatred of our nation! This victory will conclude our campaign and we can return to winter quarters, where fresh French troops who are being raised in France will join us, and the peace I shall conclude will be worthy of my people, of you, and of myself.

NAPOLEON

CHAPTER XIV

At five in the morning it was still quite dark. The troops of the center, the reserves, and Bagration's right flank had not yet moved, but on the left flank the columns of infantry, cavalry, and artillery,

which were to be the first to descend the heights to attack the French right flank and drive it into the Bohemian mountains according to plan, were already up and astir. The smoke of the campfires, into which they were throwing everything superfluous, made the eyes smart. It was cold and dark. The officers were hurriedly drinking tea and breakfasting, the soldiers, munching biscuit and beating a tattoo with their feet to warm themselves, gathering round the fires throwing into the flames the remains of sheds, chairs, tables, wheels, tubs, and everything that they did not want or could not carry away with them. Austrian column guides were moving in and out among the Russian troops and served as heralds of the advance. As soon as an Austrian officer showed himself near a commanding officer's quarters, the regiment began to move: the soldiers ran from the fires, thrust their pipes into their boots, their bags into the carts, got their muskets ready, and formed rank. The officers buttoned up their coats, buckled on their swords and pouches, and moved along the ranks shouting. The train drivers and orderlies harnessed and packed the wagons and tied on the loads. The adjutants and battalion and regimental commanders mounted, crossed themselves, gave final instructions, orders, and commissions to the baggage men who remained behind, and the monotonous tramp of thousands of feet resounded. The column moved forward without knowing where and unable, from the masses around them, the smoke and the increasing fog, to see either the place they were leaving or that to which they were going.

A soldier on the march is hemmed in and borne along by his regiment as much as a sailor is by his ship. However far he has walked, whatever strange, unknown, and dangerous places he reaches, just as a sailor is always surrounded by the same decks, masts, and rigging of his ship, so the soldier always has around him the same comrades, the same ranks, the same sergeant major Ivan Mitrich, the same company dog Jack, and the same commanders. The sailor rarely cares to know the latitude in which his ship is sailing, but on the day of battle--heaven knows how and whence--a stern note of which all are conscious sounds in the moral atmosphere of an army, announcing the approach of something decisive and solemn, and awakening in the men an unusual curiosity. On the day of battle the soldiers excitedly try to get beyond the interests of their regiment, they listen intently, look about, and eagerly ask concerning what is going on around them.

The fog had grown so dense that though it was growing light they could not see ten paces ahead. Bushes looked like gigantic trees and level ground like cliffs and slopes. Anywhere, on any side, one might encounter an enemy invisible ten paces off. But the columns advanced for a long time, always in the same fog, descending and ascending hills, avoiding gardens and enclosures, going over new and unknown ground, and nowhere encountering the enemy. On the contrary, the soldiers became aware that in front, behind, and on all sides, other Russian columns were moving in the same direction. Every soldier felt glad to know that to the unknown place where he was going, many more of our men were going too.

"There now, the Kurskies have also gone past," was being said in the ranks.

"It's wonderful what a lot of our troops have gathered, lads! Last night I looked at the campfires and there was no end of them. A regular Moscow!"

Though none of the column commanders rode up to the ranks or talked to the men (the commanders, as we saw at the council of war, were out of humor and dissatisfied with the affair, and so did not exert themselves to cheer the men but merely carried out the orders), yet the troops marched gaily, as they always do when going into action, especially to an attack. But when they had marched for about an hour in the dense fog, the greater part of the men had to halt and an unpleasant consciousness of some dislocation and blunder spread through the ranks. How such a consciousness is communicated

is very difficult to define, but it certainly is communicated very surely, and flows rapidly, imperceptibly, and irrepressibly, as water does in a creek. Had the Russian army been alone without any allies, it might perhaps have been a long time before this consciousness of mismanagement became a general conviction, but as it was, the disorder was readily and naturally attributed to the stupid Germans, and everyone was convinced that a dangerous muddle had been occasioned by the sausage eaters.

"Why have we stopped? Is the way blocked? Or have we already come up against the French?"

"No, one can't hear them. They'd be firing if we had."

"They were in a hurry enough to start us, and now here we stand in the middle of a field without rhyme or reason. It's all those damned Germans' muddling! What stupid devils!"

"Yes, I'd send them on in front, but no fear, they're crowding up behind. And now here we stand hungry."

"I say, shall we soon be clear? They say the cavalry are blocking the way," said an officer.

"Ah, those damned Germans! They don't know their own country!" said another.

"What division are you?" shouted an adjutant, riding up.

"The Eighteenth."

"Then why are you here? You should have gone on long ago, now you won't get there till evening."

"What stupid orders! They don't themselves know what they are doing!" said the officer and rode off.

Then a general rode past shouting something angrily, not in Russian.

"Tafa-la-fa! But what he's jabbering no one can make out," said a soldier, mimicking the general who had ridden away. "I'd shoot them, the scoundrels!"

"We were ordered to be at the place before nine, but we haven't got halfway. Fine orders!" was being repeated on different sides.

And the feeling of energy with which the troops had started began to turn into vexation and anger at the stupid arrangements and at the Germans.

The cause of the confusion was that while the Austrian cavalry was moving toward our left flank, the higher command found that our center was too far separated from our right flank and the cavalry were all ordered to turn back to the right. Several thousand cavalry crossed in front of the infantry, who had to wait.

At the front an altercation occurred between an Austrian guide and a Russian general. The general shouted a demand that the cavalry should be halted, the Austrian argued that not he, but the higher command, was to blame. The troops meanwhile stood growing listless and dispirited. After an hour's delay they at last moved on, descending the hill. The fog that was dispersing on the hill lay still more densely below, where they were descending. In front in the fog a shot was heard and then another, at first irregularly at varying intervals--trata... tatt--and then more and more regularly and rapidly, and the action at the Goldbach Stream began.

Not expecting to come on the enemy down by the stream, and having stumbled on him in the fog, hearing no encouraging word from their commanders, and with a consciousness of being too late spreading

through the ranks, and above all being unable to see anything in front or around them in the thick fog, the Russians exchanged shots with the enemy lazily and advanced and again halted, receiving no timely orders from the officers or adjutants who wandered about in the fog in those unknown surroundings unable to find their own regiments. In this way the action began for the first, second, and third columns, which had gone down into the valley. The fourth column, with which Kutuzov was, stood on the Pratzen Heights.

Below, where the fight was beginning, there was still thick fog; on the higher ground it was clearing, but nothing could be seen of what was going on in front. Whether all the enemy forces were, as we supposed, six miles away, or whether they were near by in that sea of mist, no one knew till after eight o'clock.

It was nine o'clock in the morning. The fog lay unbroken like a sea down below, but higher up at the village of Schlappanitz where Napoleon stood with his marshals around him, it was quite light. Above him was a clear blue sky, and the sun's vast orb quivered like a huge hollow, crimson float on the surface of that milky sea of mist. The whole French army, and even Napoleon himself with his staff, were not on the far side of the streams and hollows of Sokolnitz and Schlappanitz beyond which we intended to take up our position and begin the action, but were on this side, so close to our own forces that Napoleon with the naked eye could distinguish a mounted man from one on foot. Napoleon, in the blue cloak which he had worn on his Italian campaign, sat on his small gray Arab horse a little in front of his marshals. He gazed silently at the hills which seemed to rise out of the sea of mist and on which the Russian troops were moving in the distance, and he listened to the sounds of firing in the valley. Not a single muscle of his face--which in those days was still thin--moved. His gleaming eyes were fixed intently on one spot. His predictions were being justified. Part of the Russian force had already descended into the valley toward the ponds and lakes and part were leaving these Pratzen Heights which he intended to attack and regarded as the key to the position. He saw over the mist that in a hollow between two hills near the village of Pratzen, the Russian columns, their bayonets glittering, were moving continuously in one direction toward the valley and disappearing one after another into the mist. From information he had received the evening before, from the sound of wheels and footsteps heard by the outposts during the night, by the disorderly movement of the Russian columns, and from all indications, he saw clearly that the allies believed him to be far away in front of them, and that the columns moving near Pratzen constituted the center of the Russian army, and that that center was already sufficiently weakened to be successfully attacked. But still he did not begin the engagement.

Today was a great day for him--the anniversary of his coronation. Before dawn he had slept for a few hours, and refreshed, vigorous, and in good spirits, he mounted his horse and rode out into the field in that happy mood in which everything seems possible and everything succeeds. He sat motionless, looking at the heights visible above the mist, and his cold face wore that special look of confident, self-complacent happiness that one sees on the face of a boy happily in love. The marshals stood behind him not venturing to distract his attention. He looked now at the Pratzen Heights, now at the sun floating up out of the mist.

When the sun had entirely emerged from the fog, and fields and mist were aglow with dazzling light--as if he had only awaited this to begin the action--he drew the glove from his shapely white hand, made a sign with it to the marshals, and ordered the action to begin. The marshals, accompanied by adjutants, galloped off in different directions, and a few minutes later the chief forces of the French army moved rapidly toward those Pratzen Heights which were being more and more denuded by Russian troops moving down the valley to their left.

CHAPTER XV

At eight o'clock Kutuzov rode to Pratzen at the head of the fourth column, Miloradovich's, the one that was to take the place of Przebyszewski's and Langeron's columns which had already gone down into the valley. He greeted the men of the foremost regiment and gave them the order to march, thereby indicating that he intended to lead that column himself. When he had reached the village of Pratzen he halted. Prince Andrew was behind, among the immense number forming the commander in chief's suite. He was in a state of suppressed excitement and irritation, though controlledly calm as a man is at the approach of a long-awaited moment. He was firmly convinced that this was the day of his Toulon, or his bridge of Arcola. How it would come about he did not know, but he felt sure it would do so. The locality and the position of our troops were known to him as far as they could be known to anyone in our army. His own strategic plan, which obviously could not now be carried out, was forgotten. Now, entering into Weyrother's plan, Prince Andrew considered possible contingencies and formed new projects such as might call for his rapidity of perception and decision.

To the left down below in the mist, the musketry fire of unseen forces could be heard. It was there Prince Andrew thought the fight would concentrate. "There we shall encounter difficulties, and there," thought he, "I shall be sent with a brigade or division, and there, standard in hand, I shall go forward and break whatever is in front of me."

He could not look calmly at the standards of the passing battalions. Seeing them he kept thinking, "That may be the very standard with which I shall lead the army."

In the morning all that was left of the night mist on the heights was a hoar frost now turning to dew, but in the valleys it still lay like a milk-white sea. Nothing was visible in the valley to the left into which our troops had descended and from whence came the sounds of firing. Above the heights was the dark clear sky, and to the right the vast orb of the sun. In front, far off on the farther shore of that sea of mist, some wooded hills were discernible, and it was there the enemy probably was, for something could be descried. On the right the Guards were entering the misty region with a sound of hoofs and wheels and now and then a gleam of bayonets; to the left beyond the village similar masses of cavalry came up and disappeared in the sea of mist. In front and behind moved infantry. The commander in chief was standing at the end of the village letting the troops pass by him. That morning Kutuzov seemed worn and irritable. The infantry passing before him came to a halt without any command being given, apparently obstructed by something in front.

"Do order them to form into battalion columns and go round the village!" he said angrily to a general who had ridden up. "Don't you understand, your excellency, my dear sir, that you must not defile through narrow village streets when we are marching against the enemy?"

"I intended to re-form them beyond the village, your excellency," answered the general.

Kutuzov laughed bitterly.

"You'll make a fine thing of it, deploying in sight of the enemy! Very fine!"

"The enemy is still far away, your excellency. According to the dispositions..."

"The dispositions!" exclaimed Kutuzov bitterly. "Who told you that?... Kindly do as you are ordered."

"Yes, sir."

"My dear fellow," Nesvitski whispered to Prince Andrew, "the old man is as surly as a dog."

An Austrian officer in a white uniform with green plumes in his hat galloped up to Kutuzov and asked in the Emperor's name had the fourth column advanced into action.

Kutuzov turned round without answering and his eye happened to fall upon Prince Andrew, who was beside him. Seeing him, Kutuzov's malevolent and caustic expression softened, as if admitting that what was being done was not his adjutant's fault, and still not answering the Austrian adjutant, he addressed Bolkonski.

"Go, my dear fellow, and see whether the third division has passed the village. Tell it to stop and await my orders."

Hardly had Prince Andrew started than he stopped him.

"And ask whether sharpshooters have been posted," he added. "What are they doing? What are they doing?" he murmured to himself, still not replying to the Austrian.

Prince Andrew galloped off to execute the order.

Overtaking the battalions that continued to advance, he stopped the third division and convinced himself that there really were no sharpshooters in front of our columns. The colonel at the head of the regiment was much surprised at the commander in chief's order to throw out skirmishers. He had felt perfectly sure that there were other troops in front of him and that the enemy must be at least six miles away. There was really nothing to be seen in front except a barren descent hidden by dense mist. Having given orders in the commander in chief's name to rectify this omission, Prince Andrew galloped back. Kutuzov still in the same place, his stout body resting heavily in the saddle with the lassitude of age, sat yawning wearily with closed eyes. The troops were no longer moving, but stood with the butts of their muskets on the ground.

"All right, all right!" he said to Prince Andrew, and turned to a general who, watch in hand, was saying it was time they started as all the left-flank columns had already descended.

"Plenty of time, your excellency," muttered Kutuzov in the midst of a yawn. "Plenty of time," he repeated.

Just then at a distance behind Kutuzov was heard the sound of regiments saluting, and this sound rapidly came nearer along the whole extended line of the advancing Russian columns. Evidently the person they were greeting was riding quickly. When the soldiers of the regiment in front of which Kutuzov was standing began to shout, he rode a little to one side and looked round with a frown. Along the road from Pratzen galloped what looked like a squadron of horsemen in various uniforms. Two of them rode side by side in front, at full gallop. One in a black uniform with white plumes in his hat rode a bobtailed chestnut horse, the other who was in a white uniform rode a black one. These were the two Emperors followed by their suites. Kutuzov, affecting the manners of an old soldier at the front, gave the command "Attention!" and rode up to the Emperors with a salute. His whole appearance and manner were suddenly transformed. He put on the air of a subordinate who obeys without reasoning. With an affectation of respect which evidently struck Alexander unpleasantly, he rode up and saluted.

This unpleasant impression merely flitted over the young and happy face of the Emperor like a cloud of haze across a clear sky and

vanished. After his illness he looked rather thinner than day than on the field of Olmutz where Bolkonski had seen him for the first time abroad, but there was still the same bewitching combination of majesty and mildness in his fine gray eyes, and on his delicate lips the same capacity for varying expression and the same prevalent appearance of goodhearted innocent youth.

At the Olmutz review he had seemed more majestic; here he seemed brighter and more energetic. He was slightly flushed after galloping two miles, and reining in his horse he sighed restfully and looked round at the faces of his suite, young and animated as his own. Czartoryski, Novosiltsev, Prince Volkonsky, Stroganov, and the others, all richly dressed gay young men on splendid, well-groomed, fresh, only slightly heated horses, exchanging remarks and smiling, had stopped behind the Emperor. The Emperor Francis, a rosy, long faced young man, sat very erect on his handsome black horse, looking about him in a leisurely and preoccupied manner. He beckoned to one of his white adjutants and asked some question--"Most likely he is asking at what o'clock they started," thought Prince Andrew, watching his old acquaintance with a smile he could not repress as he recalled his reception at Brunn. In the Emperors' suite were the picked young orderly officers of the Guard and line regiments, Russian and Austrian. Among them were grooms leading the Tsar's beautiful relay horses covered with embroidered cloths.

As when a window is opened a whiff of fresh air from the fields enters a stuffy room, so a whiff of youthfulness, energy, and confidence of success reached Kutuzov's cheerless staff with the galloping advent of all these brilliant young men.

"Why aren't you beginning, Michael Ilarionovich?" said the Emperor Alexander hurriedly to Kutuzov, glancing courteously at the same time at the Emperor Francis.

"I am waiting, Your Majesty," answered Kutuzov, bending forward respectfully.

The Emperor, frowning slightly, bent his ear forward as if he had not quite heard.

"Waiting, Your Majesty," repeated Kutuzov. (Prince Andrew noted that Kutuzov's upper lip twitched unnaturally as he said the word "waiting.") "Not all the columns have formed up yet, Your Majesty."

The Tsar heard but obviously did not like the reply; he shrugged his rather round shoulders and glanced at Novosiltsev who was near him, as if complaining of Kutuzov.

"You know, Michael Ilarionovich, we are not on the Empress' Field where a parade does not begin till all the troops are assembled," said the Tsar with another glance at the Emperor Francis, as if inviting him if not to join in at least to listen to what he was saying. But the Emperor Francis continued to look about him and did not listen.

"That is just why I do not begin, sire," said Kutuzov in a resounding voice, apparently to preclude the possibility of not being heard, and again something in his face twitched--"That is just why I do not begin, sire, because we are not on parade and not on the Empress' Field." said clearly and distinctly.

In the Emperor's suite all exchanged rapid looks that expressed dissatisfaction and reproach. "Old though he may be, he should not, he certainly should not, speak like that," their glances seemed to say.

The Tsar looked intently and observantly into Kutuzov's eye waiting to hear whether he would say anything more. But Kutuzov, with respectfully bowed head, seemed also to be waiting. The silence lasted for about a minute.

"However, if you command it, Your Majesty," said Kutuzov, lifting his head and again assuming his former tone of a dull, unreasoning, but submissive general.

He touched his horse and having called Miloradovich, the commander of the column, gave him the order to advance.

The troops again began to move, and two battalions of the Novgorod and one of the Apsheron regiment went forward past the Emperor.

As this Apsheron battalion marched by, the red-faced Miloradovich, without his greatcoat, with his Orders on his breast and an enormous tuft of plumes in his cocked hat worn on one side with its corners front and back, galloped strenuously forward, and with a dashing salute reined in his horse before the Emperor.

"God be with you, general!" said the Emperor.

"Ma foi, sire, nous ferons ce qui sera dans notre possibilite, sire,"* he answered gaily, raising nevertheless ironic smiles among the gentlemen of the Tsar's suite by his poor French.

*"Indeed, Sire, we shall do everything it is possible to do, Sire."

Miloradovich wheeled his horse sharply and stationed himself a little behind the Emperor. The Apsheron men, excited by the Tsar's presence, passed in step before the Emperors and their suites at a bold, brisk pace.

"Lads!" shouted Miloradovich in a loud, self-confident, and cheery voice, obviously so elated by the sound of firing, by the prospect of battle, and by the sight of the gallant Apsherons, his comrades in Suvorov's time, now passing so gallantly before the Emperors, that he forgot the sovereigns' presence. "Lads, it's not the first village you've had to take," cried he.

"Glad to do our best!" shouted the soldiers.

The Emperor's horse started at the sudden cry. This horse that had carried the sovereign at reviews in Russia bore him also here on the field of Austerlitz, enduring the heedless blows of his left foot and pricking its ears at the sound of shots just as it had done on the Empress' Field, not understanding the significance of the firing, nor of the nearness of the Emperor Francis' black cob, nor of all that was being said, thought, and felt that day by its rider.

The Emperor turned with a smile to one of his followers and made a remark to him, pointing to the gallant Apsherons.

CHAPTER XVI

Kutuzov accompanied by his adjutants rode at a walking pace behind the carabineers.

When he had gone less than half a mile in the rear of the column he stopped at a solitary, deserted house that had probably once been an inn, where two roads parted. Both of them led downhill and troops were marching along both.

The fog had begun to clear and enemy troops were already dimly visible about a mile and a half off on the opposite heights. Down below, on the left, the firing became more distinct. Kutuzov had stopped and was speaking to an Austrian general. Prince Andrew, who

was a little behind looking at them, turned to an adjutant to ask him for a field glass.

"Look, look!" said this adjutant, looking not at the troops in the distance, but down the hill before him. "It's the French!"

The two generals and the adjutant took hold of the field glass, trying to snatch it from one another. The expression on all their faces suddenly changed to one of horror. The French were supposed to be a mile and a half away, but had suddenly and unexpectedly appeared just in front of us.

"It's the enemy?... No!... Yes, see it is!... for certain.... But how is that?" said different voices.

With the naked eye Prince Andrew saw below them to the right, not more than five hundred paces from where Kutuzov was standing, a dense French column coming up to meet the Apsheronians.

"Here it is! The decisive moment has arrived. My turn has come," thought Prince Andrew, and striking his horse he rode up to Kutuzov.

"The Apsheronians must be stopped, your excellency," cried he. But at that very instant a cloud of smoke spread all round, firing was heard quite close at hand, and a voice of naive terror barely two steps from Prince Andrew shouted, "Brothers! All's lost!" And at this as if at a command, everyone began to run.

Confused and ever-increasing crowds were running back to where five minutes before the troops had passed the Emperors. Not only would it have been difficult to stop that crowd, it was even impossible not to be carried back with it oneself. Bolkonski only tried not to lose touch with it, and looked around bewildered and unable to grasp what was happening in front of him. Nsvitski with an angry face, red and unlike himself, was shouting to Kutuzov that if he did not ride away at once he would certainly be taken prisoner. Kutuzov remained in the same place and without answering drew out a handkerchief. Blood was flowing from his cheek. Prince Andrew forced his way to him.

"You are wounded?" he asked, hardly able to master the trembling of his lower jaw.

"The wound is not here, it is there!" said Kutuzov, pressing the handkerchief to his wounded cheek and pointing to the fleeing soldiers. "Stop them!" he shouted, and at the same moment, probably realizing that it was impossible to stop them, spurred his horse and rode to the right.

A fresh wave of the flying mob caught him and bore him back with it.

The troops were running in such a dense mass that once surrounded by them it was difficult to get out again. One was shouting, "Get on! Why are you hindering us?" Another in the same place turned round and fired in the air; a third was striking the horse Kutuzov himself rode. Having by a great effort got away to the left from that flood of men, Kutuzov, with his suite diminished by more than half, rode toward a sound of artillery fire near by. Having forced his way out of the crowd of fugitives, Prince Andrew, trying to keep near Kutuzov, saw on the slope of the hill amid the smoke a Russian battery that was still firing and Frenchmen running toward it. Higher up stood some Russian infantry, neither moving forward to protect the battery nor backward with the fleeing crowd. A mounted general separated himself from the infantry and approached Kutuzov. Of Kutuzov's suite only four remained. They were all pale and exchanged looks in silence.

"Stop those wretches!" gasped Kutuzov to the regimental commander, pointing to the flying soldiers; but at that instant, as if to punish him for those words, bullets flew hissing across the regiment and across Kutuzov's suite like a flock of little birds.

The French had attacked the battery and, seeing Kutuzov, were firing at him. After this volley the regimental commander clutched at his leg; several soldiers fell, and a second lieutenant who was holding the flag let it fall from his hands. It swayed and fell, but caught on the muskets of the nearest soldiers. The soldiers started firing without orders.

"Oh! Oh! Oh!" groaned Kutuzov despairingly and looked around.... "Bolkonski!" he whispered, his voice trembling from a consciousness of the feebleness of age, "Bolkonski!" he whispered, pointing to the disordered battalion and at the enemy, "what's that?"

But before he had finished speaking, Prince Andrew, feeling tears of shame and anger choking him, had already leapt from his horse and run to the standard.

"Forward, lads!" he shouted in a voice piercing as a child's.

"Here it is!" thought he, seizing the staff of the standard and hearing with pleasure the whistle of bullets evidently aimed at him. Several soldiers fell.

"Hurrah!" shouted Prince Andrew, and, scarcely able to hold up the heavy standard, he ran forward with full confidence that the whole battalion would follow him.

And really he only ran a few steps alone. One soldier moved and then another and soon the whole battalion ran forward shouting "Hurrah!" and overtook him. A sergeant of the battalion ran up and took the flag that was swaying from its weight in Prince Andrew's hands, but he was immediately killed. Prince Andrew again seized the standard and, dragging it by the staff, ran on with the battalion. In front he saw our artillerymen, some of whom were fighting, while others, having abandoned their guns, were running toward him. He also saw French infantry soldiers who were seizing the artillery horses and turning the guns round. Prince Andrew and the battalion were already within twenty paces of the cannon. He heard the whistle of bullets above him unceasingly and to right and left of him soldiers continually groaned and dropped. But he did not look at them: he looked only at what was going on in front of him--at the battery. He now saw clearly the figure of a red-haired gunner with his shako knocked awry, pulling one end of a mop while a French soldier tugged at the other. He could distinctly see the distraught yet angry expression on the faces of these two men, who evidently did not realize what they were doing.

"What are they about?" thought Prince Andrew as he gazed at them. "Why doesn't the red-haired gunner run away as he is unarmed? Why doesn't the Frenchman stab him? He will not get away before the Frenchman remembers his bayonet and stabs him...."

And really another French soldier, trailing his musket, ran up to the struggling men, and the fate of the red-haired gunner, who had triumphantly secured the mop and still did not realize what awaited him, was about to be decided. But Prince Andrew did not see how it ended. It seemed to him as though one of the soldiers near him hit him on the head with the full swing of a bludgeon. It hurt a little, but the worst of it was that the pain distracted him and prevented his seeing what he had been looking at.

"What's this? Am I falling? My legs are giving way," thought he, and fell on his back. He opened his eyes, hoping to see how the struggle of the Frenchmen with the gunners ended, whether the red-haired gunner had been killed or not and whether the cannon had been captured or saved. But he saw nothing. Above him there was now nothing but the sky--the lofty sky, not clear yet still immeasurably lofty, with gray clouds gliding slowly across it. "How quiet, peaceful, and solemn; not at all as I ran," thought Prince Andrew--"not as we ran, shouting and fighting, not at all as the gunner and the Frenchman with

frightened and angry faces struggled for the mop: how differently do those clouds glide across that lofty infinite sky! How was it I did not see that lofty sky before? And how happy I am to have found it at last! Yes! All is vanity, all falsehood, except that infinite sky. There is nothing, nothing, but that. But even it does not exist, there is nothing but quiet and peace. Thank God!..."

CHAPTER XVII

On our right flank commanded by Bagration, at nine o'clock the battle had not yet begun. Not wishing to agree to Dolgorukov's demand to commence the action, and wishing to avert responsibility from himself, Prince Bagration proposed to Dolgorukov to send to inquire of the commander in chief. Bagration knew that as the distance between the two flanks was more than six miles, even if the messenger were not killed (which he very likely would be), and found the commander in chief (which would be very difficult), he would not be able to get back before evening.

Bagration cast his large, expressionless, sleepy eyes round his suite, and the boyish face Rostov, breathless with excitement and hope, was the first to catch his eye. He sent him.

"And if I should meet His Majesty before I meet the commander in chief, your excellency?" said Rostov, with his hand to his cap.

"You can give the message to His Majesty," said Dolgorukov, hurriedly interrupting Bagration.

On being relieved from picket duty Rostov had managed to get a few hours' sleep before morning and felt cheerful, bold, and resolute, with elasticity of movement, faith in his good fortune, and generally in that state of mind which makes everything seem possible, pleasant, and easy.

All his wishes were being fulfilled that morning: there was to be a general engagement in which he was taking part, more than that, he was orderly to the bravest general, and still more, he was going with a message to Kutuzov, perhaps even to the sovereign himself. The morning was bright, he had a good horse under him, and his heart was full of joy and happiness. On receiving the order he gave his horse the rein and galloped along the line. At first he rode along the line of Bagration's troops, which had not yet advanced into action but were standing motionless; then he came to the region occupied by Uvarov's cavalry and here he noticed a stir and signs of preparation for battle; having passed Uvarov's cavalry he clearly heard the sound of cannon and musketry ahead of him. The firing grew louder and louder.

In the fresh morning air were now heard, not two or three musket shots at irregular intervals as before, followed by one or two cannon shots, but a roll of volleys of musketry from the slopes of the hill before Pratzen, interrupted by such frequent reports of cannon that sometimes several of them were not separated from one another but merged into a general roar.

He could see puffs of musketry smoke that seemed to chase one another down the hillsides, and clouds of cannon smoke rolling, spreading, and mingling with one another. He could also, by the gleam of bayonets visible through the smoke, make out moving masses of infantry and narrow lines of artillery with green caissons.

Rostov stopped his horse for a moment on a hillock to see what was going on, but strain his attention as he would he could not understand or make out anything of what was happening: there in the smoke men

of some sort were moving about, in front and behind moved lines of troops; but why, whither, and who they were, it was impossible to make out. These sights and sounds had no depressing or intimidating effect on him; on the contrary, they stimulated his energy and determination.

"Go on! Go on! Give it them!" he mentally exclaimed at these sounds, and again proceeded to gallop along the line, penetrating farther and farther into the region where the army was already in action.

"How it will be there I don't know, but all will be well!" thought Rostov.

After passing some Austrian troops he noticed that the next part of the line (the Guards) was already in action.

"So much the better! I shall see it close," he thought.

He was riding almost along the front line. A handful of men came galloping toward him. They were our Uhlans who with disordered ranks were returning from the attack. Rostov got out of their way, involuntarily noticed that one of them was bleeding, and galloped on.

"That is no business of mine," he thought. He had not ridden many hundred yards after that before he saw to his left, across the whole width of the field, an enormous mass of cavalry in brilliant white uniforms, mounted on black horses, trotting straight toward him and across his path. Rostov put his horse to full gallop to get out of the way of these men, and he would have got clear had they continued at the same speed, but they kept increasing their pace, so that some of the horses were already galloping. Rostov heard the thud of their hoofs and the jingle of their weapons and saw their horses, their figures, and even their faces, more and more distinctly. They were our Horse Guards, advancing to attack the French cavalry that was coming to meet them.

The Horse Guards were galloping, but still holding in their horses. Rostov could already see their faces and heard the command: "Charge!" shouted by an officer who was urging his thoroughbred to full speed. Rostov, fearing to be crushed or swept into the attack on the French, galloped along the front as hard as his horse could go, but still was not in time to avoid them.

The last of the Horse Guards, a huge pockmarked fellow, frowned angrily on seeing Rostov before him, with whom he would inevitably collide. This Guardsman would certainly have bowled Rostov and his Bedouin over (Rostov felt himself quite tiny and weak compared to these gigantic men and horses) had it not occurred to Rostov to flourish his whip before the eyes of the Guardsman's horse. The heavy black horse, sixteen hands high, shied, throwing back its ears; but the pockmarked Guardsman drove his huge spurs in violently, and the horse, flourishing its tail and extending its neck, galloped on yet faster. Hardly had the Horse Guards passed Rostov before he heard them shout, "Hurrah!" and looking back saw that their foremost ranks were mixed up with some foreign cavalry with red epaulets, probably French. He could see nothing more, for immediately afterwards cannon began firing from somewhere and smoke enveloped everything.

At that moment, as the Horse Guards, having passed him, disappeared in the smoke, Rostov hesitated whether to gallop after them or to go where he was sent. This was the brilliant charge of the Horse Guards that amazed the French themselves. Rostov was horrified to hear later that of all that mass of huge and handsome men, of all those brilliant, rich youths, officers and cadets, who had galloped past him on their thousand-ruble horses, only eighteen were left after the charge.

"Why should I envy them? My chance is not lost, and maybe I shall see the Emperor immediately!" thought Rostov and galloped on.

When he came level with the Foot Guards he noticed that about them and around them cannon balls were flying, of which he was aware not so much because he heard their sound as because he saw uneasiness on the soldiers' faces and unnatural warlike solemnity on those of the officers.

Passing behind one of the lines of a regiment of Foot Guards he heard a voice calling him by name.

"Rostov!"

"What?" he answered, not recognizing Boris.

"I say, we've been in the front line! Our regiment attacked!" said Boris with the happy smile seen on the faces of young men who have been under fire for the first time.

Rostov stopped.

"Have you?" he said. "Well, how did it go?"

"We drove them back!" said Boris with animation, growing talkative. "Can you imagine it?" and he began describing how the Guards, having taken up their position and seeing troops before them, thought they were Austrians, and all at once discovered from the cannon balls discharged by those troops that they were themselves in the front line and had unexpectedly to go into action. Rostov without hearing Boris to the end spurred his horse.

"Where are you off to?" asked Boris.

"With a message to His Majesty."

"There he is!" said Boris, thinking Rostov had said "His Highness," and pointing to the Grand Duke who with his high shoulders and frowning brows stood a hundred paces away from them in his helmet and Horse Guards' jacket, shouting something to a pale, white uniformed Austrian officer.

"But that's the Grand Duke, and I want the commander in chief or the Emperor," said Rostov, and was about to spur his horse.

"Count! Count!" shouted Berg who ran up from the other side as eager as Boris. "Count! I am wounded in my right hand" (and he showed his bleeding hand with a handkerchief tied round it) "and I remained at the front. I held my sword in my left hand, Count. All our family--the von Bergs--have been knights!"

He said something more, but Rostov did not wait to hear it and rode away.

Having passed the Guards and traversed an empty space, Rostov, to avoid again getting in front of the first line as he had done when the Horse Guards charged, followed the line of reserves, going far round the place where the hottest musket fire and cannonade were heard. Suddenly he heard musket fire quite close in front of him and behind our troops, where he could never have expected the enemy to be.

"What can it be?" he thought. "The enemy in the rear of our army? Impossible!" And suddenly he was seized by a panic of fear for himself and for the issue of the whole battle. "But be that what it may," he reflected, "there is no riding round it now. I must look for the commander in chief here, and if all is lost it is for me to perish with the rest."

The foreboding of evil that had suddenly come over Rostov was more and more confirmed the farther he rode into the region behind the village of Pratzen, which was full of troops of all kinds.

"What does it mean? What is it? Whom are they firing at? Who is firing?" Rostov kept asking as he came up to Russian and Austrian soldiers running in confused crowds across his path.

"The devil knows! They've killed everybody! It's all up now!" he was told in Russian, German, and Czech by the crowd of fugitives who understood what was happening as little as he did.

"Kill the Germans!" shouted one.

"May the devil take them--the traitors!"

"Zum Henker diese Russen!"* muttered a German.

*"Hang these Russians!"

Several wounded men passed along the road, and words of abuse, screams, and groans mingled in a general hubbub, then the firing died down. Rostov learned later that Russian and Austrian soldiers had been firing at one another.

"My God! What does it all mean?" thought he. "And here, where at any moment the Emperor may see them.... But no, these must be only a handful of scoundrels. It will soon be over, it can't be that, it can't be! Only to get past them quicker, quicker!"

The idea of defeat and flight could not enter Rostov's head. Though he saw French cannon and French troops on the Pratzen Heights just where he had been ordered to look for the commander in chief, he could not, did not wish to, believe that.

CHAPTER XVIII

Rostov had been ordered to look for Kutuzov and the Emperor near the village of Pratzen. But neither they nor a single commanding officer were there, only disorganized crowds of troops of various kinds. He urged on his already weary horse to get quickly past these crowds, but the farther he went the more disorganized they were. The highroad on which he had come out was thronged with caleches, carriages of all sorts, and Russian and Austrian soldiers of all arms, some wounded and some not. This whole mass droned and jostled in confusion under the dismal influence of cannon balls flying from the French batteries stationed on the Pratzen Heights.

"Where is the Emperor? Where is Kutuzov?" Rostov kept asking everyone he could stop, but got no answer from anyone.

At last seizing a soldier by his collar he forced him to answer.

"Eh, brother! They've all bolted long ago!" said the soldier, laughing for some reason and shaking himself free.

Having left that soldier who was evidently drunk, Rostov stopped the horse of a batman or groom of some important personage and began to question him. The man announced that the Tsar had been driven in a carriage at full speed about an hour before along that very road and that he was dangerously wounded.

"It can't be!" said Rostov. "It must have been someone else."

"I saw him myself." replied the man with a self-confident smile of derision. "I ought to know the Emperor by now, after the times I've seen him in Petersburg. I saw him just as I see you.... There he sat

in the carriage as pale as anything. How they made the four black horses fly! Gracious me, they did rattle past! It's time I knew the Imperial horses and Ilya Ivanych. I don't think Ilya drives anyone except the Tsar!"

Rostov let go of the horse and was about to ride on, when a wounded officer passing by addressed him:

"Who is it you want?" he asked. "The commander in chief? He was killed by a cannon ball--struck in the breast before our regiment."

"Not killed--wounded!" another officer corrected him.

"Who? Kutuzov?" asked Rostov.

"Not Kutuzov, but what's his name--well, never mind... there are not many left alive. Go that way, to that village, all the commanders are there," said the officer, pointing to the village of Hosjeradek, and he walked on.

Rostov rode on at a footpace not knowing why or to whom he was now going. The Emperor was wounded, the battle lost. It was impossible to doubt it now. Rostov rode in the direction pointed out to him, in which he saw turrets and a church. What need to hurry? What was he now to say to the Tsar or to Kutuzov, even if they were alive and unwounded?

"Take this road, your honor, that way you will be killed at once!" a soldier shouted to him. "They'd kill you there!"

"Oh, what are you talking about?" said another. "Where is he to go? That way is nearer."

Rostov considered, and then went in the direction where they said he would be killed.

"It's all the same now. If the Emperor is wounded, am I to try to save myself?" he thought. He rode on to the region where the greatest number of men had perished in fleeing from Pratzen. The French had not yet occupied that region, and the Russians--the uninjured and slightly wounded--had left it long ago. All about the field, like heaps of manure on well-kept plowland, lay from ten to fifteen dead and wounded to each couple of acres. The wounded crept together in twos and threes and one could hear their distressing screams and groans, sometimes feigned--or so it seemed to Rostov. He put his horse to a trot to avoid seeing all these suffering men, and he felt afraid--afraid not for his life, but for the courage he needed and which he knew would not stand the sight of these unfortunates.

The French, who had ceased firing at this field strewn with dead and wounded where there was no one left to fire at, on seeing an adjutant riding over it trained a gun on him and fired several shots. The sensation of those terrible whistling sounds and of the corpses around him merged in Rostov's mind into a single feeling of terror and pity for himself. He remembered his mother's last letter. "What would she feel," thought he, "if she saw me here now on this field with the cannon aimed at me?"

In the village of Hosjeradek there were Russian troops retiring from the field of battle, who though still in some confusion were less disordered. The French cannon did not reach there and the musketry fire sounded far away. Here everyone clearly saw and said that the battle was lost. No one whom Rostov asked could tell him where the Emperor or Kutuzov was. Some said the report that the Emperor was wounded was correct, others that it was not, and explained the false rumor that had spread by the fact that the Emperor's carriage had really galloped from the field of battle with the pale and terrified Ober-Hofmarschal Count Tolstoy, who had ridden out to the battlefield with others in the Emperor's suite. One officer told Rostov that he had seen someone from headquarters behind the village

to the left, and thither Rostov rode, not hoping to find anyone but merely to ease his conscience. When he had ridden about two miles and had passed the last of the Russian troops, he saw, near a kitchen garden with a ditch round it, two men on horseback facing the ditch. One with a white plume in his hat seemed familiar to Rostov; the other on a beautiful chestnut horse (which Rostov fancied he had seen before) rode up to the ditch, struck his horse with his spurs, and giving it the rein leaped lightly over. Only a little earth crumbled from the bank under the horse's hind hoofs. Turning the horse sharply, he again jumped the ditch, and deferentially addressed the horseman with the white plumes, evidently suggesting that he should do the same. The rider, whose figure seemed familiar to Rostov and involuntarily riveted his attention, made a gesture of refusal with his head and hand and by that gesture Rostov instantly recognized his lamented and adored monarch.

"But it can't be he, alone in the midst of this empty field!" thought Rostov. At that moment Alexander turned his head and Rostov saw the beloved features that were so deeply engraved on his memory. The Emperor was pale, his cheeks sunken and his eyes hollow, but the charm, the mildness of his features, was all the greater. Rostov was happy in the assurance that the rumors about the Emperor being wounded were false. He was happy to be seeing him. He knew that he might and even ought to go straight to him and give the message Dolgorukov had ordered him to deliver.

But as a youth in love trembles, is unnerved, and dares not utter the thoughts he has dreamed of for nights, but looks around for help or a chance of delay and flight when the longed-for moment comes and he is alone with her, so Rostov, now that he had attained what he had longed for more than anything else in the world, did not know how to approach the Emperor, and a thousand reasons occurred to him why it would be inconvenient, unseemly, and impossible to do so.

"What! It is as if I were glad of a chance to take advantage of his being alone and despondent! A strange face may seem unpleasant or painful to him at this moment of sorrow; besides, what can I say to him now, when my heart fails me and my mouth feels dry at the mere sight of him?" Not one of the innumerable speeches addressed to the Emperor that he had composed in his imagination could he now recall. Those speeches were intended for quite other conditions, they were for the most part to be spoken at a moment of victory and triumph, generally when he was dying of wounds and the sovereign had thanked him for heroic deeds, and while dying he expressed the love his actions had proved.

"Besides how can I ask the Emperor for his instructions for the right flank now that it is nearly four o'clock and the battle is lost? No, certainly I must not approach him, I must not intrude on his reflections. Better die a thousand times than risk receiving an unkind look or bad opinion from him," Rostov decided; and sorrowfully and with a heart full despair he rode away, continually looking back at the Tsar, who still remained in the same attitude of indecision.

While Rostov was thus arguing with himself and riding sadly away, Captain von Toll chanced to ride to the same spot, and seeing the Emperor at once rode up to him, offered his services, and assisted him to cross the ditch on foot. The Emperor, wishing to rest and feeling unwell, sat down under an apple tree and von Toll remained beside him. Rostov from a distance saw with envy and remorse how von Toll spoke long and warmly to the Emperor and how the Emperor, evidently weeping, covered his eyes with his hand and pressed von Toll's hand.

"And I might have been in his place!" thought Rostov, and hardly restraining his tears of pity for the Emperor, he rode on in utter despair, not knowing where to or why he was now riding.

His despair was all the greater from feeling that his own weakness was the cause his grief.

He might... not only might but should, have gone up to the sovereign. It was a unique chance to show his devotion to the Emperor and he had not made use of it.... "What have I done?" thought he. And he turned round and galloped back to the place where he had seen the Emperor, but there was no one beyond the ditch now. Only some carts and carriages were passing by. From one of the drivers he learned that Kutuzov's staff were not far off, in the village the vehicles were going to. Rostov followed them. In front of him walked Kutuzov's groom leading horses in horsecloths. Then came a cart, and behind that walked an old, bandy-legged domestic serf in a peaked cap and sheepskin coat.

"Tit! I say, Tit!" said the groom.

"What?" answered the old man absent-mindedly.

"Go, Tit! Thresh a bit!"

"Oh, you fool!" said the old man, spitting angrily. Some time passed in silence, and then the same joke was repeated.

Before five in the evening the battle had been lost at all points. More than a hundred cannon were already in the hands of the French.

Przebyszewski and his corps had laid down their arms. Other columns after losing half their men were retreating in disorderly confused masses.

The remains of Langeron's and Dokhturov's mingled forces were crowding around the dams and banks of the ponds near the village of Augesd.

After five o'clock it was only at the Augesd Dam that a hot cannonade (delivered by the French alone) was still to be heard from numerous batteries ranged on the slopes of the Pratzen Heights, directed at our retreating forces.

In the rearguard, Dokhturov and others rallying some battalions kept up a musketry fire at the French cavalry that was pursuing our troops. It was growing dusk. On the narrow Augesd Dam where for so many years the old miller had been accustomed to sit in his tasseled cap peacefully angling, while his grandson, with shirt sleeves rolled up, handled the floundering silvery fish in the watering can, on that dam over which for so many years Moravians in shaggy caps and blue jackets had peacefully driven their two-horse carts loaded with wheat and had returned dusty with flour whitening their carts--on that narrow dam amid the wagons and the cannon, under the horses' hoofs and between the wagon wheels, men disfigured by fear of death now crowded together, crushing one another, dying, stepping over the dying and killing one another, only to move on a few steps and be killed themselves in the same way.

Every ten seconds a cannon ball flew compressing the air around, or a shell burst in the midst of that dense throng, killing some and splashing with blood those near them.

Dolokhov--now an officer--wounded in the arm, and on foot, with the regimental commander on horseback and some ten men of his company, represented all that was left of that whole regiment. Impelled by the crowd, they had got wedged in at the approach to the dam and, jammed in on all sides, had stopped because a horse in front had fallen under a cannon and the crowd were dragging it out. A cannon ball killed someone behind them, another fell in front and splashed Dolokhov with blood. The crowd, pushing forward desperately, squeezed together, moved a few steps, and again stopped.

"Move on a hundred yards and we are certainly saved, remain here another two minutes and it is certain death," thought each one.

Dolokhov who was in the midst of the crowd forced his way to the edge of the dam, throwing two soldiers off their feet, and ran onto the slippery ice that covered the millpool.

"Turn this way!" he shouted, jumping over the ice which creaked under him; "turn this way!" he shouted to those with the gun. "It bears!..."

The ice bore him but it swayed and creaked, and it was plain that it would give way not only under a cannon or a crowd, but very soon even under his weight alone. The men looked at him and pressed to the bank, hesitating to step onto the ice. The general on horseback at the entrance to the dam raised his hand and opened his mouth to address Dolokhov. Suddenly a cannon ball hissed so low above the crowd that everyone ducked. It flopped into something moist, and the general fell from his horse in a pool of blood. Nobody gave him a look or thought of raising him.

"Get onto the ice, over the ice! Go on! Turn! Don't you hear? Go on!" innumerable voices suddenly shouted after the ball had struck the general, the men themselves not knowing what, or why, they were shouting.

One of the hindmost guns that was going onto the dam turned off onto the ice. Crowds of soldiers from the dam began running onto the frozen pond. The ice gave way under one of the foremost soldiers, and one leg slipped into the water. He tried to right himself but fell in up to his waist. The nearest soldiers shrank back, the gun driver stopped his horse, but from behind still came the shouts: "Onto the ice, why do you stop? Go on! Go on!" And cries of horror were heard in the crowd. The soldiers near the gun waved their arms and beat the horses to make them turn and move on. The horses moved off the bank. The ice, that had held under those on foot, collapsed in a great mass, and some forty men who were on it dashed, some forward and some back, drowning one another.

Still the cannon balls continued regularly to whistle and flop onto the ice and into the water and oftenest of all among the crowd that covered the dam, the pond, and the bank.

CHAPTER XIX

On the Pratzen Heights, where he had fallen with the flagstaff in his hand, lay Prince Andrew Bolkonski bleeding profusely and unconsciously uttering a gentle, piteous, and childlike moan.

Toward evening he ceased moaning and became quite still. He did not know how long his unconsciousness lasted. Suddenly he again felt that he was alive and suffering from a burning, lacerating pain in his head.

"Where is it, that lofty sky that I did not know till now, but saw today?" was his first thought. "And I did not know this suffering either," he thought. "Yes, I did not know anything, anything at all till now. But where am I?"

He listened and heard the sound of approaching horses, and voices speaking French. He opened his eyes. Above him again was the same lofty sky with clouds that had risen and were floating still higher, and between them gleamed blue infinity. He did not turn his head and did not see those who, judging by the sound of hoofs and voices, had ridden up and stopped near him.

It was Napoleon accompanied by two aides-de-camp. Bonaparte riding

over the battlefield had given final orders to strengthen the batteries firing at the Augesd Dam and was looking at the killed and wounded left on the field.

"Fine men!" remarked Napoleon, looking at a dead Russian grenadier, who, with his face buried in the ground and a blackened nape, lay on his stomach with an already stiffened arm flung wide.

"The ammunition for the guns in position is exhausted, Your Majesty," said an adjutant who had come from the batteries that were firing at Augesd.

"Have some brought from the reserve," said Napoleon, and having gone on a few steps he stopped before Prince Andrew, who lay on his back with the flagstaff that had been dropped beside him. (The flag had already been taken by the French as a trophy.)

"That's a fine death!" said Napoleon as he gazed at Bolkonski.

Prince Andrew understood that this was said of him and that it was Napoleon who said it. He heard the speaker addressed as Sire. But he heard the words as he might have heard the buzzing of a fly. Not only did they not interest him, but he took no notice of them and at once forgot them. His head was burning, he felt himself bleeding to death, and he saw above him the remote, lofty, and everlasting sky. He knew it was Napoleon--his hero--but at that moment Napoleon seemed to him such a small, insignificant creature compared with what was passing now between himself and that lofty infinite sky with the clouds flying over it. At that moment it meant nothing to him who might be standing over him, or what was said of him; he was only glad that people were standing near him and only wished that they would help him and bring him back to life, which seemed to him so beautiful now that he had today learned to understand it so differently. He collected all his strength, to stir and utter a sound. He feebly moved his leg and uttered a weak, sickly groan which aroused his own pity.

"Ah! He is alive," said Napoleon. "Lift this young man up and carry him to the dressing station."

Having said this, Napoleon rode on to meet Marshal Lannes, who, hat in hand, rode up smiling to the Emperor to congratulate him on the victory.

Prince Andrew remembered nothing more: he lost consciousness from the terrible pain of being lifted onto the stretcher, the jolting while being moved, and the probing of his wound at the dressing station. He did not regain consciousness till late in the day, when with other wounded and captured Russian officers he was carried to the hospital. During this transfer he felt a little stronger and was able to look about him and even speak.

The first words he heard on coming to his senses were those of a French convoy officer, who said rapidly: "We must halt here: the Emperor will pass here immediately; it will please him to see these gentlemen prisoners."

"There are so many prisoners today, nearly the whole Russian army, that he is probably tired of them," said another officer.

"All the same! They say this one is the commander of all the Emperor Alexander's Guards," said the first one, indicating a Russian officer in the white uniform of the Horse Guards.

Bolkonski recognized Prince Repnin whom he had met in Petersburg society. Beside him stood a lad of nineteen, also a wounded officer of the Horse Guards.

Bonaparte, having come up at a gallop, stopped his horse.

"Which is the senior?" he asked, on seeing the prisoners.

They named the colonel, Prince Repnin.

"You are the commander of the Emperor Alexander's regiment of Horse Guards?" asked Napoleon.

"I commanded a squadron," replied Repnin.

"Your regiment fulfilled its duty honorably," said Napoleon.

"The praise of a great commander is a soldier's highest reward," said Repnin.

"I bestow it with pleasure," said Napoleon. "And who is that young man beside you?"

Prince Repnin named Lieutenant Sukhtelen.

After looking at him Napoleon smiled.

"He's very young to come to meddle with us."

"Youth is no hindrance to courage," muttered Sukhtelen in a failing voice.

"A splendid reply!" said Napoleon. "Young man, you will go far!"

Prince Andrew, who had also been brought forward before the Emperor's eyes to complete the show of prisoners, could not fail to attract his attention. Napoleon apparently remembered seeing him on the battlefield and, addressing him, again used the epithet "young man" that was connected in his memory with Prince Andrew.

"Well, and you, young man," said he. "How do you feel, mon brave?"

Though five minutes before, Prince Andrew had been able to say a few words to the soldiers who were carrying him, now with his eyes fixed straight on Napoleon, he was silent.... So insignificant at that moment seemed to him all the interests that engrossed Napoleon, so mean did his hero himself with his paltry vanity and joy in victory appear, compared to the lofty, equitable, and kindly sky which he had seen and understood, that he could not answer him.

Everything seemed so futile and insignificant in comparison with the stern and solemn train of thought that weakness from loss of blood, suffering, and the nearness of death aroused in him. Looking into Napoleon's eyes Prince Andrew thought of the insignificance of greatness, the unimportance of life which no one could understand, and the still greater unimportance of death, the meaning of which no one alive could understand or explain.

The Emperor without waiting for an answer turned away and said to one of the officers as he went: "Have these gentlemen attended to and taken to my bivouac; let my doctor, Larrey, examine their wounds. Au revoir, Prince Repnin!" and he spurred his horse and galloped away.

His face shone with self-satisfaction and pleasure.

The soldiers who had carried Prince Andrew had noticed and taken the little gold icon Princess Mary had hung round her brother's neck, but seeing the favor the Emperor showed the prisoners, they now hastened to return the holy image.

Prince Andrew did not see how and by whom it was replaced, but the little icon with its thin gold chain suddenly appeared upon his chest outside his uniform.

"It would be good," thought Prince Andrew, glancing at the icon

his sister had hung round his neck with such emotion and reverence, "it would be good if everything were as clear and simple as it seems to Mary. How good it would be to know where to seek for help in this life, and what to expect after it beyond the grave! How happy and calm I should be if I could now say: 'Lord, have mercy on me!'... But to whom should I say that? Either to a Power indefinable, incomprehensible, which I not only cannot address but which I cannot even express in words--the Great All or Nothing--" said he to himself, "or to that God who has been sewn into this amulet by Mary! There is nothing certain, nothing at all except the unimportance of everything I understand, and the greatness of something incomprehensible but all-important."

The stretchers moved on. At every jolt he again felt unendurable pain; his feverishness increased and he grew delirious. Visions of his father, wife, sister, and future son, and the tenderness he had felt the night before the battle, the figure of the insignificant little Napoleon, and above all this the lofty sky, formed the chief subjects of his delirious fancies.

The quiet home life and peaceful happiness of Bald Hills presented itself to him. He was already enjoying that happiness when that little Napoleon had suddenly appeared with his unsympathizing look of shortsighted delight at the misery of others, and doubts and torments had followed, and only the heavens promised peace. Toward morning all these dreams melted and merged into the chaos and darkness of unconsciousness and oblivion which in the opinion of Napoleon's doctor, Larrey, was much more likely to end in death than in convalescence.

"He is a nervous, bilious subject," said Larrey, "and will not recover."

And Prince Andrew, with others fatally wounded, was left to the care of the inhabitants of the district.

BOOK FOUR: 1806

CHAPTER I

Early in the year 1806 Nicholas Rostov returned home on leave. Denisov was going home to Voronezh and Rostov persuaded him to travel with him as far as Moscow and to stay with him there. Meeting a comrade at the last post station but one before Moscow, Denisov had drunk three bottles of wine with him and, despite the jolting ruts across the snow-covered road, did not once wake up on the way to Moscow, but lay at the bottom of the sleigh beside Rostov, who grew more and more impatient the nearer they got to Moscow.

"How much longer? How much longer? Oh, these insufferable streets, shops, bakers' signboards, street lamps, and sleighs!" thought Rostov, when their leave permits had been passed at the town gate and they had entered Moscow.

"Denisov! We're here! He's asleep," he added, leaning forward with his whole body as if in that position he hoped to hasten the speed of the sleigh.

Denisov gave no answer.

"There's the corner at the crossroads, where the cabman, Zakhar, has his stand, and there's Zakhar himself and still the same horse! And here's the little shop where we used to buy gingerbread! Can't you

hurry up? Now then!"

"Which house is it?" asked the driver.

"Why, that one, right at the end, the big one. Don't you see? That's our house," said Rostov. "Of course, it's our house! Denisov, Denisov! We're almost there!"

Denisov raised his head, coughed, and made no answer.

"Dmitri," said Rostov to his valet on the box, "those lights are in our house, aren't they?"

"Yes, sir, and there's a light in your father's study."

"Then they've not gone to bed yet? What do you think? Mind now, don't forget to put out my new coat," added Rostov, fingering his new mustache. "Now then, get on," he shouted to the driver. "Do wake up, Vaska!" he went on, turning to Denisov, whose head was again nodding. "Come, get on! You shall have three rubles for vodka--get on!" Rostov shouted, when the sleigh was only three houses from his door. It seemed to him the horses were not moving at all. At last the sleigh bore to the right, drew up at an entrance, and Rostov saw overhead the old familiar cornice with a bit of plaster broken off, the porch, and the post by the side of the pavement. He sprang out before the sleigh stopped, and ran into the hall. The house stood cold and silent, as if quite regardless of who had come to it. There was no one in the hall. "Oh God! Is everyone all right?" he thought, stopping for a moment with a sinking heart, and then immediately starting to run along the hall and up the warped steps of the familiar staircase. The well-known old door handle, which always angered the countess when it was not properly cleaned, turned as loosely as ever. A solitary tallow candle burned in the anteroom.

Old Michael was asleep on the chest. Prokofy, the footman, who was so strong that he could lift the back of the carriage from behind, sat plaiting slippers out of cloth selvedges. He looked up at the opening door and his expression of sleepy indifference suddenly changed to one of delighted amazement.

"Gracious heavens! The young count!" he cried, recognizing his young master. "Can it be? My treasure!" and Prokofy, trembling with excitement, rushed toward the drawing-room door, probably in order to announce him, but, changing his mind, came back and stooped to kiss the young man's shoulder.

"All well?" asked Rostov, drawing away his arm.

"Yes, God be thanked! Yes! They've just finished supper. Let me have a look at you, your excellency."

"Is everything quite all right?"

"The Lord be thanked, yes!"

Rostov, who had completely forgotten Denisov, not wishing anyone to forestall him, threw off his fur coat and ran on tiptoe through the large dark ballroom. All was the same: there were the same old card tables and the same chandelier with a cover over it; but someone had already seen the young master, and, before he had reached the drawing room, something flew out from a side door like a tornado and began hugging and kissing him. Another and yet another creature of the same kind sprang from a second door and a third; more hugging, more kissing, more outcries, and tears of joy. He could not distinguish which was Papa, which Natasha, and which Petya. Everyone shouted, talked, and kissed him at the same time. Only his mother was not there, he noticed that.

"And I did not know... Nicholas... My darling!..."

"Here he is... our own... Kolya,* dear fellow... How he has changed!... Where are the candles?... Tea!..."

*Nicholas.

"And me, kiss me!"

"Dearest... and me!"

Sonya, Natasha, Petya, Anna Mikhaylovna, Vera, and the old count were all hugging him, and the serfs, men and maids, flocked into the room, exclaiming and oh-ing and ah-ing.

Petya, clinging to his legs, kept shouting, "And me too!"

Natasha, after she had pulled him down toward her and covered his face with kisses, holding him tight by the skirt of his coat, sprang away and pranced up and down in one place like a goat and shrieked piercingly.

All around were loving eyes glistening with tears of joy, and all around were lips seeking a kiss.

Sonya too, all rosy red, clung to his arm and, radiant with bliss, looked eagerly toward his eyes, waiting for the look for which she longed. Sonya now was sixteen and she was very pretty, especially at this moment of happy, rapturous excitement. She gazed at him, not taking her eyes off him, and smiling and holding her breath. He gave her a grateful look, but was still expectant and looking for someone. The old countess had not yet come. But now steps were heard at the door, steps so rapid that they could hardly be his mother's.

Yet it was she, dressed in a new gown which he did not know, made since he had left. All the others let him go, and he ran to her. When they met, she fell on his breast, sobbing. She could not lift her face, but only pressed it to the cold braiding of his hussar's jacket. Denisov, who had come into the room unnoticed by anyone, stood there and wiped his eyes at the sight.

"Vasili Denisov, your son's friend," he said, introducing himself to the count, who was looking inquiringly at him.

"You are most welcome! I know, I know," said the count, kissing and embracing Denisov. "Nicholas wrote us... Natasha, Vera, look! Here is Denisov!"

The same happy, rapturous faces turned to the shaggy figure of Denisov.

"Darling Denisov!" screamed Natasha, beside herself with rapture, springing to him, putting her arms round him, and kissing him. This escapade made everybody feel confused. Denisov blushed too, but smiled and, taking Natasha's hand, kissed it.

Denisov was shown to the room prepared for him, and the Rostovs all gathered round Nicholas in the sitting room.

The old countess, not letting go of his hand and kissing it every moment, sat beside him: the rest, crowding round him, watched every movement, word, or look of his, never taking their blissfully adoring eyes off him. His brother and sisters struggled for the places nearest to him and disputed with one another who should bring him his tea, handkerchief, and pipe.

Rostov was very happy in the love they showed him; but the first moment of meeting had been so beatific that his present joy seemed insufficient, and he kept expecting something more, more and yet more.

Next morning, after the fatigues of their journey, the travelers slept till ten o'clock.

In the room next their bedroom there was a confusion of sabers, satchels, sabretaches, open portmanteaus, and dirty boots. Two freshly cleaned pairs with spurs had just been placed by the wall. The servants were bringing in jugs and basins, hot water for shaving, and their well-brushed clothes. There was a masculine odor and a smell of tobacco.

"Hallo, Gwiska--my pipe!" came Vasili Denisov's husky voice.
"Wostov, get up!"

Rostov, rubbing his eyes that seemed glued together, raised his disheveled head from the hot pillow.

"Why, is it late?"

"Late! It's nearly ten o'clock," answered Natasha's voice. A rustle of starched petticoats and the whispering and laughter of girls' voices came from the adjoining room. The door was opened a crack and there was a glimpse of something blue, of ribbons, black hair, and merry faces. It was Natasha, Sonya, and Petya, who had come to see whether they were getting up.

"Nicholas! Get up!" Natasha's voice was again heard at the door.

"Directly!"

Meanwhile, Petya, having found and seized the sabers in the outer room, with the delight boys feel at the sight of a military elder brother, and forgetting that it was unbecoming for the girls to see men undressed, opened the bedroom door.

"Is this your saber?" he shouted.

The girls sprang aside. Denisov hid his hairy legs under the blanket, looking with a scared face at his comrade for help. The door, having let Petya in, closed again. A sound of laughter came from behind it.

"Nicholas! Come out in your dressing gown!" said Natasha's voice.

"Is this your saber?" asked Petya. "Or is it yours?" he said, addressing the black-mustached Denisov with servile deference.

Rostov hurriedly put something on his feet, drew on his dressing gown, and went out. Natasha had put on one spurred boot and was just getting her foot into the other. Sonya, when he came in, was twirling round and was about to expand her dresses into a balloon and sit down. They were dressed alike, in new pale-blue frocks, and were both fresh, rosy, and bright. Sonya ran away, but Natasha, taking her brother's arm, led him into the sitting room, where they began talking. They hardly gave one another time to ask questions and give replies concerning a thousand little matters which could not interest anyone but themselves. Natasha laughed at every word he said or that she said herself, not because what they were saying was amusing, but because she felt happy and was unable to control her joy which expressed itself by laughter.

"Oh, how nice, how splendid!" she said to everything.

Rostov felt that, under the influence of the warm rays of love, that childlike smile which had not once appeared on his face since he left home now for the first time after eighteen months again brightened his soul and his face.

"No, but listen," she said, "now you are quite a man, aren't you? I'm awfully glad you're my brother." She touched his mustache. "I want to know what you men are like. Are you the same as we? No?"

"Why did Sonya run away?" asked Rostov.

"Ah, yes! That's a whole long story! How are you going to speak to her--thou or you?"

"As may happen," said Rostov.

"No, call her you, please! I'll tell you all about it some other time. No, I'll tell you now. You know Sonya's my dearest friend. Such a friend that I burned my arm for her sake. Look here!"

She pulled up her muslin sleeve and showed him a red scar on her long, slender, delicate arm, high above the elbow on that part that is covered even by a ball dress.

"I burned this to prove my love for her. I just heated a ruler in the fire and pressed it there!"

Sitting on the sofa with the little cushions on its arms, in what used to be his old schoolroom, and looking into Natasha's wildly bright eyes, Rostov re-entered that world of home and childhood which had no meaning for anyone else, but gave him some of the best joys of his life; and the burning of an arm with a ruler as a proof of love did not seem to him senseless, he understood and was not surprised at it.

"Well, and is that all?" he asked.

"We are such friends, such friends! All that ruler business was just nonsense, but we are friends forever. She, if she loves anyone, does it for life, but I don't understand that, I forget quickly."

"Well, what then?"

"Well, she loves me and you like that."

Natasha suddenly flushed.

"Why, you remember before you went away?... Well, she says you are to forget all that.... She says: 'I shall love him always, but let him be free.' Isn't that lovely and noble! Yes, very noble? Isn't it?" asked Natasha, so seriously and excitedly that it was evident that what she was now saying she had talked of before, with tears.

Rostov became thoughtful.

"I never go back on my word," he said. "Besides, Sonya is so charming that only a fool would renounce such happiness."

"No, no!" cried Natasha, "she and I have already talked it over. We knew you'd say so. But it won't do, because you see, if you say that--if you consider yourself bound by your promise--it will seem as if she had not meant it seriously. It makes it as if you were marrying her because you must, and that wouldn't do at all."

Rostov saw that it had been well considered by them. Sonya had already struck him by her beauty on the preceding day. Today, when he had caught a glimpse of her, she seemed still more lovely. She was a charming girl of sixteen, evidently passionately in love with him (he did not doubt that for an instant). Why should he not love her now, and even marry her, Rostov thought, but just now there were so many other pleasures and interests before him! "Yes, they have taken a wise decision," he thought, "I must remain free."

"Well then, that's excellent," said he. "We'll talk it over later on. Oh, how glad I am to have you!"

"Well, and are you still true to Boris?" he continued.

"Oh, what nonsense!" cried Natasha, laughing. "I don't think about him or anyone else, and I don't want anything of the kind."

"Dear me! Then what are you up now?"

"Now?" repeated Natasha, and a happy smile lit up her face. "Have you seen Duport?"

"No."

"Not seen Duport--the famous dancer? Well then, you won't understand. That's what I'm up to."

Curving her arms, Natasha held out her skirts as dancers do, ran back a few steps, turned, cut a caper, brought her little feet sharply together, and made some steps on the very tips of her toes.

"See, I'm standing! See!" she said, but could not maintain herself on her toes any longer. "So that's what I'm up to! I'll never marry anyone, but will be a dancer. Only don't tell anyone."

Rostov laughed so loud and merrily that Denisov, in his bedroom, felt envious and Natasha could not help joining in.

"No, but don't you think it's nice?" she kept repeating.

"Nice! And so you no longer wish to marry Boris?"

Natasha flared up. "I don't want to marry anyone. And I'll tell him so when I see him!"

"Dear me!" said Rostov.

"But that's all rubbish," Natasha chattered on. "And is Denisov nice?" she asked.

"Yes, indeed!"

"Oh, well then, good-by: go and dress. Is he very terrible, Denisov?"

"Why terrible?" asked Nicholas. "No, Vaska is a splendid fellow."

"You call him Vaska? That's funny! And is he very nice?"

"Very."

"Well then, be quick. We'll all have breakfast together."

And Natasha rose and went out of the room on tiptoe, like a ballet dancer, but smiling as only happy girls of fifteen can smile. When Rostov met Sonya in the drawing room, he reddened. He did not know how to behave with her. The evening before, in the first happy moment of meeting, they had kissed each other, but today they felt it could not be done; he felt that everybody, including his mother and sisters, was looking inquiringly at him and watching to see how he would behave with her. He kissed her hand and addressed her not as thou but as you-Sonya. But their eyes met and said thou, and exchanged tender kisses. Her looks asked him to forgive her for having dared, by Natasha's intermediacy, to remind him of his promise, and then thanked him for his love. His looks thanked her for offering him his freedom and told her that one way or another he would never cease to love her, for that would be impossible.

"How strange it is," said Vera, selecting a moment when all were silent, "that Sonya and Nicholas now say you to one another and meet like strangers."

Vera's remark was correct, as her remarks always were, but, like most of her observations, it made everyone feel uncomfortable, not

only Sonya, Nicholas, and Natasha, but even the old countess, who-dreading this love affair which might hinder Nicholas from making a brilliant match--blushed like a girl.

Denisov, to Rostov's surprise, appeared in the drawing room with pomaded hair, perfumed, and in a new uniform, looking just as smart as he made himself when going into battle, and he was more amiable to the ladies and gentlemen than Rostov had ever expected to see him.

CHAPTER II

On his return to Moscow from the army, Nicholas Rostov was welcomed by his home circle as the best of sons, a hero, and their darling Nikolenka; by his relations as a charming, attractive, and polite young man; by his acquaintances as a handsome lieutenant of hussars, a good dancer, and one of the best matches in the city.

The Rostovs knew everybody in Moscow. The old count had money enough that year, as all his estates had been remortgaged, and so Nicholas, acquiring a trotter of his own, very stylish riding breeches of the latest cut, such as no one else yet had in Moscow, and boots of the latest fashion, with extremely pointed toes and small silver spurs, passed his time very gaily. After a short period of adapting himself to the old conditions of life, Nicholas found it very pleasant to be at home again. He felt that he had grown up and matured very much. His despair at failing in a Scripture examination, his borrowing money from Gavril to pay a sleigh driver, his kissing Sonya on the sly--he now recalled all this as childishness he had left immeasurably behind. Now he was a lieutenant of hussars, in a jacket laced with silver, and wearing the Cross of St. George, awarded to soldiers for bravery in action, and in the company of well-known, elderly, and respected racing men was training a trotter of his own for a race. He knew a lady on one of the boulevards whom he visited of an evening. He led the mazurka at the Arkharovs' ball, talked about the war with Field Marshal Kamenski, visited the English Club, and was on intimate terms with a colonel of forty to whom Denisov had introduced him.

His passion for the Emperor had cooled somewhat in Moscow. But still, as he did not see him and had no opportunity of seeing him, he often spoke about him and about his love for him, letting it be understood that he had not told all and that there was something in his feelings for the Emperor not everyone could understand, and with his whole soul he shared the adoration then common in Moscow for the Emperor, who was spoken of as the "angel incarnate."

During Rostov's short stay in Moscow, before rejoining the army, he did not draw closer to Sonya, but rather drifted away from her. She was very pretty and sweet, and evidently deeply in love with him, but he was at the period of youth when there seems so much to do that there is no time for that sort of thing and a young man fears to bind himself and prizes his freedom which he needs for so many other things. When he thought of Sonya, during this stay in Moscow, he said to himself, "Ah, there will be, and there are, many more such girls somewhere whom I do not yet know. There will be time enough to think about love when I want to, but now I have no time." Besides, it seemed to him that the society of women was rather derogatory to his manhood. He went to balls and into ladies' society with an affectation of doing so against his will. The races, the English Club, sprees with Denisov, and visits to a certain house--that was another matter and quite the thing for a dashing young hussar!

At the beginning of March, old Count Ilya Rostov was very busy arranging a dinner in honor of Prince Bagration at the English Club.

The count walked up and down the hall in his dressing gown, giving

orders to the club steward and to the famous Feoktist, the Club's head cook, about asparagus, fresh cucumbers, strawberries, veal, and fish for this dinner. The count had been a member and on the committee of the Club from the day it was founded. To him the Club entrusted the arrangement of the festival in honor of Bagration, for few men knew so well how to arrange a feast on an open-handed, hospitable scale, and still fewer men would be so well able and willing to make up out of their own resources what might be needed for the success of the fete. The club cook and the steward listened to the count's orders with pleased faces, for they knew that under no other management could they so easily extract a good profit for themselves from a dinner costing several thousand rubles.

"Well then, mind and have cocks' comb in the turtle soup, you know!"

"Shall we have three cold dishes then?" asked the cook.

The count considered.

"We can't have less--yes, three... the mayonnaise, that's one," said he, bending down a finger.

"Then am I to order those large sterlets?" asked the steward.

"Yes, it can't be helped if they won't take less. Ah, dear me! I was forgetting. We must have another entree. Ah, goodness gracious!" he clutched at his head. "Who is going to get me the flowers? Dmitri! Eh, Dmitri! Gallop off to our Moscow estate," he said to the factotum who appeared at his call. "Hurry off and tell Maksim, the gardener, to set the serfs to work. Say that everything out of the hothouses must be brought here well wrapped up in felt. I must have two hundred pots here on Friday."

Having given several more orders, he was about to go to his "little countess" to have a rest, but remembering something else of importance, he returned again, called back the cook and the club steward, and again began giving orders. A light footstep and the clinking of spurs were heard at the door, and the young count, handsome, rosy, with a dark little mustache, evidently rested and made sleeker by his easy life in Moscow, entered the room.

"Ah, my boy, my head's in a whirl!" said the old man with a smile, as if he felt a little confused before his son. "Now, if you would only help a bit! I must have singers too. I shall have my own orchestra, but shouldn't we get the gypsy singers as well? You military men like that sort of thing."

"Really, Papa, I believe Prince Bagration worried himself less before the battle of Schon Grabern than you do now," said his son with a smile.

The old count pretended to be angry.

"Yes, you talk, but try it yourself!"

And the count turned to the cook, who, with a shrewd and respectful expression, looked observantly and sympathetically at the father and son.

"What have the young people come to nowadays, eh, Feoktist?" said he. "Laughing at us old fellows!"

"That's so, your excellency, all they have to do is to eat a good dinner, but providing it and serving it all up, that's not their business!"

"That's it, that's it!" exclaimed the count, and gaily seizing his son by both hands, he cried, "Now I've got you, so take the sleigh and pair at once, and go to Bezukhob's, and tell him 'Count Ilya has sent you to ask for strawberries and fresh pineapples.' We can't get

them from anyone else. He's not there himself, so you'll have to go in and ask the princesses; and from there go on to the Rasgulyay--the coachman Ipatka knows--and look up the gypsy Ilyushka, the one who danced at Count Orlov's, you remember, in a white Cossack coat, and bring him along to me."

"And am I to bring the gypsy girls along with him?" asked Nicholas, laughing. "Dear, dear!..."

At that moment, with noiseless footsteps and with the businesslike, preoccupied, yet meekly Christian look which never left her face, Anna Mikhaylovna entered the hall. Though she came upon the count in his dressing gown every day, he invariably became confused and begged her to excuse his costume.

"No matter at all, my dear count," she said, meekly closing her eyes. "But I'll go to Bezukhov's myself. Pierre has arrived, and now we shall get anything we want from his hothouses. I have to see him in any case. He has forwarded me a letter from Boris. Thank God, Boris is now on the staff."

The count was delighted at Anna Mikhaylovna's taking upon herself one of his commissions and ordered the small closed carriage for her.

"Tell Bezukhov to come. I'll put his name down. Is his wife with him?" he asked.

Anna Mikhaylovna turned up her eyes, and profound sadness was depicted on her face.

"Ah, my dear friend, he is very unfortunate," she said. "If what we hear is true, it is dreadful. How little we dreamed of such a thing when we were rejoicing at his happiness! And such a lofty angelic soul as young Bezukhov! Yes, I pity him from my heart, and shall try to give him what consolation I can."

"Wh-what is the matter?" asked both the young and old Rostov.

Anna Mikhaylovna sighed deeply.

"Dolokhov, Mary Ivanovna's son," she said in a mysterious whisper, "has compromised her completely, they say. Pierre took him up, invited him to his house in Petersburg, and now... she has come here and that daredevil after her!" said Anna Mikhaylovna, wishing to show her sympathy for Pierre, but by involuntary intonations and a half smile betraying her sympathy for the "daredevil," as she called Dolokhov. "They say Pierre is quite broken by his misfortune."

"Dear, dear! But still tell him to come to the Club--it will all blow over. It will be a tremendous banquet."

Next day, the third of March, soon after one o'clock, two hundred and fifty members of the English Club and fifty guests were awaiting the guest of honor and hero of the Austrian campaign, Prince Bagration, to dinner.

On the first arrival of the news of the battle of Austerlitz, Moscow had been bewildered. At that time, the Russians were so used to victories that on receiving news of the defeat some would simply not believe it, while others sought some extraordinary explanation of so strange an event. In the English Club, where all who were distinguished, important, and well informed forgathered when the news began to arrive in December, nothing was said about the war and the last battle, as though all were in a conspiracy of silence. The men who set the tone in conversation--Count Rostopchin, Prince Yuri Dolgorukov, Valuev, Count Markov, and Prince Vyazemski--did not show themselves at the Club, but met in private houses in intimate circles, and the Moscovites who took their opinions from others--Ilya Rostov among them--remained for a while without any definite opinion on the subject of the war and without leaders. The Moscovites felt that

something was wrong and that to discuss the bad news was difficult, and so it was best to be silent. But after a while, just as a jury comes out of its room, the bigwigs who guided the Club's opinion reappeared, and everybody began speaking clearly and definitely. Reasons were found for the incredible, unheard-of, and impossible event of a Russian defeat, everything became clear, and in all corners of Moscow the same things began to be said. These reasons were the treachery of the Austrians, a defective commissariat, the treachery of the Pole Przebyszewski and of the Frenchman Langeron, Kutuzov's incapacity, and (it was whispered) the youth and inexperience of the sovereign, who had trusted worthless and insignificant people. But the army, the Russian army, everyone declared, was extraordinary and had achieved miracles of valor. The soldiers, officers, and generals were heroes. But the hero of heroes was Prince Bagration, distinguished by his Schon Grabern affair and by the retreat from Austerlitz, where he alone had withdrawn his column unbroken and had all day beaten back an enemy force twice as numerous as his own. What also conduced to Bagration's being selected as Moscow's hero was the fact that he had no connections in the city and was a stranger there. In his person, honor was shown to a simple fighting Russian soldier without connections and intrigues, and to one who was associated by memories of the Italian campaign with the name of Suvorov. Moreover, paying such honor to Bagration was the best way of expressing disapproval and dislike of Kutuzov.

"Had there been no Bagration, it would have been necessary to invent him," said the wit Shinshin, parodying the words of Voltaire. Kutuzov no one spoke of, except some who abused him in whispers, calling him a court weathercock and an old satyr.

All Moscow repeated Prince Dolgorukov's saying: "If you go on modeling and modeling you must get smeared with clay," suggesting consolation for our defeat by the memory of former victories; and the words of Rostopchin, that French soldiers have to be incited to battle by highfalutin words, and Germans by logical arguments to show them that it is more dangerous to run away than to advance, but that Russian soldiers only need to be restrained and held back! On all sides, new and fresh anecdotes were heard of individual examples of heroism shown by our officers and men at Austerlitz. One had saved a standard, another had killed five Frenchmen, a third had loaded five cannon singlehanded. Berg was mentioned, by those who did not know him, as having, when wounded in the right hand, taken his sword in the left, and gone forward. Of Bolkonski, nothing was said, and only those who knew him intimately regretted that he had died so young, leaving a pregnant wife with his eccentric father.

CHAPTER III

On that third of March, all the rooms in the English Club were filled with a hum of conversation, like the hum of bees swarming in springtime. The members and guests of the Club wandered hither and thither, sat, stood, met, and separated, some in uniform and some in evening dress, and a few here and there with powdered hair and in Russian kaftans. Powdered footmen, in livery with buckled shoes and smart stockings, stood at every door anxiously noting visitors' every movement in order to offer their services. Most of those present were elderly, respected men with broad, self-confident faces, fat fingers, and resolute gestures and voices. This class of guests and members sat in certain habitual places and met in certain habitual groups. A minority of those present were casual guests--chiefly young men, among whom were Denisov, Rostov, and Dolokhov--who was now again an officer in the Semenov regiment. The faces of these young people, especially those who were militarymen, bore that expression of condescending respect for their elders which seems to say to the older generation, "We are prepared to respect and honor you, but all the

same remember that the future belongs to us."

Nesvitski was there as an old member of the Club. Pierre, who at his wife's command had let his hair grow and abandoned his spectacles, went about the rooms fashionably dressed but looking sad and dull. Here, as elsewhere, he was surrounded by an atmosphere of subservience to his wealth, and being in the habit of lording it over these people, he treated them with absent-minded contempt.

By his age he should have belonged to the younger men, but by his wealth and connections he belonged to the groups old and honored guests, and so he went from one group to another. Some of the most important old men were the center of groups which even strangers approached respectfully to hear the voices of well-known men. The largest circles formed round Count Rostopchin, Valuev, and Naryshkin. Rostopchin was describing how the Russians had been overwhelmed by flying Austrians and had had to force their way through them with bayonets.

Valuev was confidentially telling that Uvarov had been sent from Petersburg to ascertain what Moscow was thinking about Austerlitz.

In the third circle, Naryshkin was speaking of the meeting of the Austrian Council of War at which Suvorov crowed like a cock in reply to the nonsense talked by the Austrian generals. Shinshin, standing close by, tried to make a joke, saying that Kutuzov had evidently failed to learn from Suvorov even so simple a thing as the art of crowing like a cock, but the elder members glanced severely at the wit, making him feel that in that place and on that day, it was improper to speak so of Kutuzov.

Count Ilya Rostov, hurried and preoccupied, went about in his soft boots between the dining and drawing rooms, hastily greeting the important and unimportant, all of whom he knew, as if they were all equals, while his eyes occasionally sought out his fine well-set-up young son, resting on him and winking joyfully at him. Young Rostov stood at a window with Dolokhov, whose acquaintance he had lately made and highly valued. The old count came up to them and pressed Dolokhov's hand.

"Please come and visit us... you know my brave boy... been together out there... both playing the hero... Ah, Vasili Ignatovich... How d'ye do, old fellow?" he said, turning to an old man who was passing, but before he had finished his greeting there was a general stir, and a footman who had run in announced, with a frightened face: "He's arrived!"

Bells rang, the stewards rushed forward, and--like rye shaken together in a shovel--the guests who had been scattered about in different rooms came together and crowded in the large drawing room by the door of the ballroom.

Bagration appeared in the doorway of the anteroom without hat or sword, which, in accord with the Club custom, he had given up to the hall porter. He had no lambskin cap on his head, nor had he a loaded whip over his shoulder, as when Rostov had seen him on the eve of the battle of Austerlitz, but wore a tight new uniform with Russian and foreign Orders, and the Star of St. George on his left breast. Evidently just before coming to the dinner he had had his hair and whiskers trimmed, which changed his appearance for the worse. There was something naively festive in his air, which, in conjunction with his firm and virile features, gave him a rather comical expression. Bekleshev and Theodore Uvarov, who had arrived with him, paused at the doorway to allow him, as the guest of honor, to enter first. Bagration was embarrassed, not wishing to avail himself of their courtesy, and this caused some delay at the doors, but after all he did at last enter first. He walked shyly and awkwardly over the parquet floor of the reception room, not knowing what to do with his hands; he was more accustomed to walk over a plowed field under fire, as he had done at the head of the Kursk regiment at Schon Grabern--and he would have

found that easier. The committeemen met him at the first door and, expressing their delight at seeing such a highly honored guest, took possession of him as it were, without waiting for his reply, surrounded him, and led him to the drawing room. It was at first impossible to enter the drawing-room door for the crowd of members and guests jostling one another and trying to get a good look at Bagration over each other's shoulders, as if he were some rare animal. Count Ilya Rostov, laughing and repeating the words, "Make way, dear boy! Make way, make way!" pushed through the crowd more energetically than anyone, led the guests into the drawing room, and seated them on the center sofa. The bigwigs, the most respected members of the Club, beset the new arrivals. Count Ilya, again thrusting his way through the crowd, went out of the drawing room and reappeared a minute later with another committeeman, carrying a large silver salver which he presented to Prince Bagration. On the salver lay some verses composed and printed in the hero's honor. Bagration, on seeing the salver, glanced around in dismay, as though seeking help. But all eyes demanded that he should submit. Feeling himself in their power, he resolutely took the salver with both hands and looked sternly and reproachfully at the count who had presented it to him. Someone obligingly took the dish from Bagration (or he would, it seemed, have held it till evening and have gone in to dinner with it) and drew his attention to the verses.

"Well, I will read them, then!" Bagration seemed to say, and, fixing his weary eyes on the paper, began to read them with a fixed and serious expression. But the author himself took the verses and began reading them aloud. Bagration bowed his head and listened:

Bring glory then to Alexander's reign
And on the throne our Titus shield.
A dreaded foe be thou, kindhearted as a man,
A Rhipheus at home, a Caesar in the field!
E'en fortunate Napoleon
Knows by experience, now, Bagration,
And dare not Herculean Russians trouble...

But before he had finished reading, a stentorian major-domo announced that dinner was ready! The door opened, and from the dining room came the resounding strains of the polonaise:

Conquest's joyful thunder waken,
Triumph, valiant Russians, now!...

and Count Rostov, glancing angrily at the author who went on reading his verses, bowed to Bagration. Everyone rose, feeling that dinner was more important than verses, and Bagration, again preceding all the rest, went in to dinner. He was seated in the place of honor between two Alexanders--Bekleshev and Naryshkin--which was a significant allusion to the name of the sovereign. Three hundred persons took their seats in the dining room, according to their rank and importance: the more important nearer to the honored guest, as naturally as water flows deepest where the land lies lowest.

Just before dinner, Count Ilya Rostov presented his son to Bagration, who recognized him and said a few words to him, disjointed and awkward, as were all the words he spoke that day, and Count Ilya looked joyfully and proudly around while Bagration spoke to his son.

Nicholas Rostov, with Denisov and his new acquaintance, Dolokhov, sat almost at the middle of the table. Facing them sat Pierre, beside Prince Nesvitski. Count Ilya Rostov with the other members of the committee sat facing Bagration and, as the very personification of Moscow hospitality, did the honors to the prince.

His efforts had not been in vain. The dinner, both the Lenten and the other fare, was splendid, yet he could not feel quite at ease till the end of the meal. He winked at the butler, whispered directions to the footmen, and awaited each expected dish with some anxiety.

Everything was excellent. With the second course, a gigantic sterlet (at sight of which Ilya Rostov blushed with self-conscious pleasure), the footmen began popping corks and filling the champagne glasses. After the fish, which made a certain sensation, the count exchanged glances with the other committeemen. "There will be many toasts, it's time to begin," he whispered, and taking up his glass, he rose. All were silent, waiting for what he would say.

"To the health of our Sovereign, the Emperor!" he cried, and at the same moment his kindly eyes grew moist with tears of joy and enthusiasm. The band immediately struck up "Conquest's joyful thunder waken..." All rose and cried "Hurrah!" Bagration also rose and shouted "Hurrah!" in exactly the same voice in which he had shouted it on the field at Schon Grabern. Young Rostov's ecstatic voice could be heard above the three hundred others. He nearly wept. "To the health of our Sovereign, the Emperor!" he roared, "Hurrah!" and emptying his glass at one gulp he dashed it to the floor. Many followed his example, and the loud shouting continued for a long time. When the voices subsided, the footmen cleared away the broken glass and everybody sat down again, smiling at the noise they had made and exchanging remarks. The old count rose once more, glanced at a note lying beside his plate, and proposed a toast, "To the health of the hero of our last campaign, Prince Peter Ivanovich Bagration!" and again his blue eyes grew moist. "Hurrah!" cried the three hundred voices again, but instead of the band a choir began singing a cantata composed by Paul Ivanovich Kutuzov:

Russians! O'er all barriers on!
Courage conquest guarantees;
Have we not Bagration?
He brings foe men to their knees,... etc.

As soon as the singing was over, another and another toast was proposed and Count Ilya Rostov became more and more moved, more glass was smashed, and the shouting grew louder. They drank to Bekleshev, Naryshkin, Uvarov, Dolgorukov, Apraksin, Valuev, to the committee, to all the Club members and to all the Club guests, and finally to Count Ilya Rostov separately, as the organizer of the banquet. At that toast, the count took out his handkerchief and, covering his face, wept outright.

CHAPTER IV

Pierre sat opposite Dolokhov and Nicholas Rostov. As usual, he ate and drank much, and eagerly. But those who knew him intimately noticed that some great change had come over him that day. He was silent all through dinner and looked about, blinking and scowling, or, with fixed eyes and a look of complete absent-mindedness, kept rubbing the bridge of his nose. His face was depressed and gloomy. He seemed to see and hear nothing of what was going on around him and to be absorbed by some depressing and unsolved problem.

The unsolved problem that tormented him was caused by hints given by the princess, his cousin, at Moscow, concerning Dolokhov's intimacy with his wife, and by an anonymous letter he had received that morning, which in the mean jocular way common to anonymous letters said that he saw badly through his spectacles, but that his wife's connection with Dolokhov was a secret to no one but himself. Pierre absolutely disbelieved both the princess' hints and the letter, but he feared now to look at Dolokhov, who was sitting opposite him. Every time he chanced to meet Dolokhov's handsome insolent eyes, Pierre felt something terrible and monstrous rising in his soul and turned quickly away. Involuntarily recalling his wife's past and her relations with Dolokhov, Pierre saw clearly that what was said in the letter might be

true, or might at least seem to be true had it not referred to his wife. He involuntarily remembered how Dolokhov, who had fully recovered his former position after the campaign, had returned to Petersburg and come to him. Availing himself of his friendly relations with Pierre as a boon companion, Dolokhov had come straight to his house, and Pierre had put him up and lent him money. Pierre recalled how Helene had smilingly expressed disapproval of Dolokhov's living at their house, and how cynically Dolokhov had praised his wife's beauty to him and from that time till they came to Moscow had not left them for a day.

"Yes, he is very handsome," thought Pierre, "and I know him. It would be particularly pleasant to him to dishonor my name and ridicule me, just because I have exerted myself on his behalf, befriended him, and helped him. I know and understand what a spice that would add to the pleasure of deceiving me, if it really were true. Yes, if it were true, but I do not believe it. I have no right to, and can't, believe it." He remembered the expression Dolokhov's face assumed in his moments of cruelty, as when tying the policeman to the bear and dropping them into the water, or when he challenged a man to a duel without any reason, or shot a post-boy's horse with a pistol. That expression was often on Dolokhov's face when looking at him. "Yes, he is a bully," thought Pierre, "to kill a man means nothing to him. It must seem to him that everyone is afraid of him, and that must please him. He must think that I, too, am afraid of him--and in fact I am afraid of him," he thought, and again he felt something terrible and monstrous rising in his soul. Dolokhov, Denisov, and Rostov were now sitting opposite Pierre and seemed very gay. Rostov was talking merrily to his two friends, one of whom was a dashing hussar and the other a notorious duelist and rake, and every now and then he glanced ironically at Pierre, whose preoccupied, absent-minded, and massive figure was a very noticeable one at the dinner. Rostov looked inimically at Pierre, first because Pierre appeared to his hussar eyes as a rich civilian, the husband of a beauty, and in a word--an old woman; and secondly because Pierre in his preoccupation and absent-mindedness had not recognized Rostov and had not responded to his greeting. When the Emperor's health was drunk, Pierre, lost in thought, did not rise or lift his glass.

"What are you about?" shouted Rostov, looking at him in an ecstasy of exasperation. "Don't you hear it's His Majesty the Emperor's health?"

Pierre sighed, rose submissively, emptied his glass, and, waiting till all were seated again, turned with his kindly smile to Rostov.

"Why, I didn't recognize you!" he said. But Rostov was otherwise engaged; he was shouting "Hurrah!"

"Why don't you renew the acquaintance?" said Dolokhov to Rostov.

"Confound him, he's a fool!" said Rostov.

"One should make up to the husbands of pretty women," said Denisov.

Pierre did not catch what they were saying, but knew they were talking about him. He reddened and turned away.

"Well, now to the health of handsome women!" said Dolokhov, and with a serious expression, but with a smile lurking at the corners of his mouth, he turned with his glass to Pierre.

"Here's to the health of lovely women, Peterkin--and their lovers!" he added.

Pierre, with downcast eyes, drank out of his glass without looking at Dolokhov or answering him. The footman, who was distributing leaflets with Kutuzov's cantata, laid one before Pierre as one of the principal guests. He was just going to take it when Dolokhov, leaning across, snatched it from his hand and began reading it. Pierre

looked at Dolokhov and his eyes dropped, the something terrible and monstrous that had tormented him all dinnertime rose and took possession of him. He leaned his whole massive body across the table.

"How dare you take it?" he shouted.

Hearing that cry and seeing to whom it was addressed, Nesvitski and the neighbor on his right quickly turned in alarm to Bezukhov.

"Don't! Don't! What are you about?" whispered their frightened voices.

Dolokhov looked at Pierre with clear, mirthful, cruel eyes, and that smile of his which seemed to say, "Ah! This is what I like!"

"You shan't have it!" he said distinctly.

Pale, with quivering lips, Pierre snatched the copy.

"You...! you... scoundrel! I challenge you!" he ejaculated, and, pushing back his chair, he rose from the table.

At the very instant he did this and uttered those words, Pierre felt that the question of his wife's guilt which had been tormenting him the whole day was finally and indubitably answered in the affirmative. He hated her and was forever sundered from her. Despite Denisov's request that he would take no part in the matter, Rostov agreed to be Dolokhov's second, and after dinner he discussed the arrangements for the duel with Nesvitski, Bezukhov's second. Pierre went home, but Rostov with Dolokhov and Denisov stayed on at the Club till late, listening to the gypsies and other singers.

"Well then, till tomorrow at Sokolniki," said Dolokhov, as he took leave of Rostov in the Club porch.

"And do you feel quite calm?" Rostov asked.

Dolokhov paused.

"Well, you see, I'll tell you the whole secret of dueling in two words. If you are going to fight a duel, and you make a will and write affectionate letters to your parents, and if you think you may be killed, you are a fool and are lost for certain. But go with the firm intention of killing your man as quickly and surely as possible, and then all will be right, as our bear huntsman at Kostroma used to tell me. 'Everyone fears a bear,' he says, 'but when you see one your fear's all gone, and your only thought is not to let him get away!' And that's how it is with me. A demain, mon cher."*

*Till tomorrow, my dear fellow.

Next day, at eight in the morning, Pierre and Nesvitski drove to the Sokolniki forest and found Dolokhov, Denisov, and Rostov already there. Pierre had the air of a man preoccupied with considerations which had no connection with the matter in hand. His haggard face was yellow. He had evidently not slept that night. He looked about distractedly and screwed up his eyes as if dazzled by the sun. He was entirely absorbed by two considerations: his wife's guilt, of which after his sleepless night he had not the slightest doubt, and the guiltlessness of Dolokhov, who had no reason to preserve the honor of a man who was nothing to him.... "I should perhaps have done the same thing in his place," thought Pierre. "It's even certain that I should have done the same, then why this duel, this murder? Either I shall kill him, or he will hit me in the head, or elbow, or knee. Can't I go away from here, run away, bury myself somewhere?" passed through his mind. But just at moments when such thoughts occurred to him, he would ask in a particularly calm and absent-minded way, which inspired the respect of the onlookers, "Will it be long? Are

things ready?"

When all was ready, the sabers stuck in the snow to mark the barriers, and the pistols loaded, Nesvitski went up to Pierre.

"I should not be doing my duty, Count," he said in timid tones, "and should not justify your confidence and the honor you have done me in choosing me for your second, if at this grave, this very grave, moment I did not tell you the whole truth. I think there is no sufficient ground for this affair, or for blood to be shed over it.... You were not right, not quite in the right, you were impetuous..."

"Oh yes, it is horribly stupid," said Pierre.

"Then allow me to express your regrets, and I am sure your opponent will accept them," said Nesvitski (who like the others concerned in the affair, and like everyone in similar cases, did not yet believe that the affair had come to an actual duel). "You know, Count, it is much more honorable to admit one's mistake than to let matters become irreparable. There was no insult on either side. Allow me to convey...."

"No! What is there to talk about?" said Pierre. "It's all the same.... Is everything ready?" he added. "Only tell me where to go and where to shoot," he said with an unnaturally gentle smile.

He took the pistol in his hand and began asking about the working of the trigger, as he had not before held a pistol in his hand--a fact that he did not to confess.

"Oh yes, like that, I know, I only forgot," said he.

"No apologies, none whatever," said Dolokhov to Denisov (who on his side had been attempting a reconciliation), and he also went up to the appointed place.

The spot chosen for the duel was some eighty paces from the road, where the sleighs had been left, in a small clearing in the pine forest covered with melting snow, the frost having begun to break up during the last few days. The antagonists stood forty paces apart at the farther edge of the clearing. The seconds, measuring the paces, left tracks in the deep wet snow between the place where they had been standing and Nesvitski's and Dolokhov's sabers, which were stuck into the ground ten paces apart to mark the barrier. It was thawing and misty; at forty paces' distance nothing could be seen. For three minutes all had been ready, but they still delayed and all were silent.

CHAPTER V

"Well begin!" said Dolokhov.

"All right," said Pierre, still smiling in the same way. A feeling of dread was in the air. It was evident that the affair so lightly begun could no longer be averted but was taking its course independently of men's will.

Denisov first went to the barrier and announced: "As the adve'sawies have wefused a weconciliation, please pwoceed. Take your pistols, and at the word thwee begin to advance.

"O-ne! T-wo! Thwee!" he shouted angrily and stepped aside.

The combatants advanced along the trodden tracks, nearer and nearer to one another, beginning to see one another through the

mist. They had the right to fire when they liked as they approached the barrier. Dolokhov walked slowly without raising his pistol, looking intently with his bright, sparkling blue eyes into his antagonist's face. His mouth wore its usual semblance of a smile.

"So I can fire when I like!" said Pierre, and at the word "three," he went quickly forward, missing the trodden path and stepping into the deep snow. He held the pistol in his right hand at arm's length, apparently afraid of shooting himself with it. His left hand he held carefully back, because he wished to support his right hand with it and knew he must not do so. Having advanced six paces and strayed off the track into the snow, Pierre looked down at his feet, then quickly glanced at Dolokhov and, bending his finger as he had been shown, fired. Not at all expecting so loud a report, Pierre shuddered at the sound and then, smiling at his own sensations, stood still. The smoke, rendered denser by the mist, prevented him from seeing anything for an instant, but there was no second report as he had expected. He only heard Dolokhov's hurried steps, and his figure came in view through the smoke. He was pressing one hand to his left side, while the other clutched his drooping pistol. His face was pale. Rostov ran toward him and said something.

"No-o-o!" muttered Dolokhov through his teeth, "no, it's not over." And after stumbling a few staggering steps right up to the saber, he sank on the snow beside it. His left hand was bloody; he wiped it on his coat and supported himself with it. His frowning face was pallid and quivered.

"Plea..." began Dolokhov, but could not at first pronounce the word.

"Please," he uttered with an effort.

Pierre, hardly restraining his sobs, began running toward Dolokhov and was about to cross the space between the barriers, when Dolokhov cried:

"To your barrier!" and Pierre, grasping what was meant, stopped by his saber. Only ten paces divided them. Dolokhov lowered his head to the snow, greedily bit at it, again raised his head, adjusted himself, drew in his legs and sat up, seeking a firm center of gravity. He sucked and swallowed the cold snow, his lips quivered but his eyes, still smiling, glittered with effort and exasperation as he mustered his remaining strength. He raised his pistol and aimed.

"Sideways! Cover yourself with your pistol!" ejaculated Nesvitski.

"Cover yourself!" even Denisov cried to his adversary.

Pierre, with a gentle smile of pity and remorse, his arms and legs helplessly spread out, stood with his broad chest directly facing Dolokhov looked sorrowfully at him. Denisov, Rostov, and Nesvitski closed their eyes. At the same instant they heard a report and Dolokhov's angry cry.

"Missed!" shouted Dolokhov, and he lay helplessly, face downwards on the snow.

Pierre clutched his temples, and turning round went into the forest, trampling through the deep snow, and muttering incoherent words:

"Folly... folly! Death... lies..." he repeated, puckering his face.

Nesvitski stopped him and took him home.

Rostov and Denisov drove away with the wounded Dolokhov.

The latter lay silent in the sleigh with closed eyes and did not answer a word to the questions addressed to him. But on entering Moscow he suddenly came to and, lifting his head with an effort, took Rostov, who was sitting beside him, by the hand. Rostov was

struck by the totally altered and unexpectedly rapturous and tender expression on Dolokhov's face.

"Well? How do you feel?" he asked.

"Bad! But it's not that, my friend—" said Dolokhov with a gasping voice. "Where are we? In Moscow, I know. I don't matter, but I have killed her, killed... She won't get over it! She won't survive...."

"Who?" asked Rostov.

"My mother! My mother, my angel, my adored angel mother," and Dolokhov pressed Rostov's hand and burst into tears.

When he had become a little quieter, he explained to Rostov that he was living with his mother, who, if she saw him dying, would not survive it. He implored Rostov to go on and prepare her.

Rostov went on ahead to do what was asked, and to his great surprise learned that Dolokhov the brawler, Dolokhov the bully, lived in Moscow with an old mother and a hunchback sister, and was the most affectionate of sons and brothers.

CHAPTER VI

Pierre had of late rarely seen his wife alone. Both in Petersburg and in Moscow their house was always full of visitors. The night after the duel he did not go to his bedroom but, as he often did, remained in his father's room, that huge room in which Count Bezukhov had died.

He lay down on the sofa meaning to fall asleep and forget all that had happened to him, but could not do so. Such a storm of feelings, thoughts, and memories suddenly arose within him that he could not fall asleep, nor even remain in one place, but had to jump up and pace the room with rapid steps. Now he seemed to see her in the early days of their marriage, with bare shoulders and a languid, passionate look on her face, and then immediately he saw beside her Dolokhov's handsome, insolent, hard, and mocking face as he had seen it at the banquet, and then that same face pale, quivering, and suffering, as it had been when he reeled and sank on the snow.

"What has happened?" he asked himself. "I have killed her lover, yes, killed my wife's lover. Yes, that was it! And why? How did I come to do it?" -- "Because you married her," answered an inner voice.

"But in what was I to blame?" he asked. "In marrying her without loving her; in deceiving yourself and her." And he vividly recalled that moment after supper at Prince Vasili's, when he spoke those words he had found so difficult to utter: "I love you." "It all comes from that! Even then I felt it," he thought. "I felt then that it was not so, that I had no right to do it. And so it turns out."

He remembered his honeymoon and blushed at the recollection. Particularly vivid, humiliating, and shameful was the recollection of how one day soon after his marriage he came out of the bedroom into his study a little before noon in his silk dressing gown and found his head steward there, who, bowing respectfully, looked into his face and at his dressing gown and smiled slightly, as if expressing respectful understanding of his employer's happiness.

"But how often I have felt proud of her, proud of her majestic beauty and social tact," thought he; "been proud of my house, in which she received all Petersburg, proud of her unapproachability and beauty. So this is what I was proud of! I then thought that I did not understand her. How often when considering her character I have

told myself that I was to blame for not understanding her, for not understanding that constant composure and complacency and lack of all interests or desires, and the whole secret lies in the terrible truth that she is a depraved woman. Now I have spoken that terrible word to myself all has become clear.

"Anatole used to come to borrow money from her and used to kiss her naked shoulders. She did not give him the money, but let herself be kissed. Her father in jest tried to rouse her jealousy, and she replied with a calm smile that she was not so stupid as to be jealous: 'Let him do what he pleases,' she used to say of me. One day I asked her if she felt any symptoms of pregnancy. She laughed contemptuously and said she was not a fool to want to have children, and that she was not going to have any children by me."

Then he recalled the coarseness and bluntness of her thoughts and the vulgarity of the expressions that were natural to her, though she had been brought up in the most aristocratic circles.

"I'm not such a fool.... Just you try it on.... Allez-vous promener,"* she used to say. Often seeing the success she had with young and old men and women Pierre could not understand why he did not love her.

*"You clear out of this."

"Yes, I never loved her," said he to himself; "I knew she was a depraved woman," he repeated, "but dared not admit it to myself. And now there's Dolokhov sitting in the snow with a forced smile and perhaps dying, while meeting my remorse with some forced bravado!"

Pierre was one of those people who, in spite of an appearance of what is called weak character, do not seek a confidant in their troubles. He digested his sufferings alone.

"It is all, all her fault," he said to himself; "but what of that? Why did I bind myself to her? Why did I say 'Je vous aime'* to her, which was a lie, and worse than a lie? I am guilty and must endure... what? A slur on my name? A misfortune for life? Oh, that's nonsense," he thought. "The slur on my name and honor--that's all apart from myself.

*I love you.

"Louis XVI was executed because they said he was dishonorable and a criminal," came into Pierre's head, "and from their point of view they were right, as were those too who canonized him and died a martyr's death for his sake. Then Robespierre was beheaded for being a despot. Who is right and who is wrong? No one! But if you are alive--live: tomorrow you'll die as I might have died an hour ago. And is it worth tormenting oneself, when one has only a moment of life in comparison with eternity?"

But at the moment when he imagined himself calmed by such reflections, she suddenly came into his mind as she was at the moments when he had most strongly expressed his insincere love for her, and he felt the blood rush to his heart and had again to get up and move about and break and tear whatever came to his hand. "Why did I tell her that 'Je vous aime'?" he kept repeating to himself. And when he had said it for the tenth time, Molibre's words: "Mais que diable alloit-il faire dans cette galere?" occurred to him, and he began to laugh at himself.

In the night he called his valet and told him to pack up to go to Petersburg. He could not imagine how he could speak to her now. He resolved to go away next day and leave a letter informing her of his

intention to part from her forever.

Next morning when the valet came into the room with his coffee, Pierre was lying asleep on the ottoman with an open book in his hand.

He woke up and looked round for a while with a startled expression, unable to realize where he was.

"The countess told me to inquire whether your excellency was at home," said the valet.

But before Pierre could decide what answer he would send, the countess herself in a white satin dressing gown embroidered with silver and with simply dressed hair (two immense plaits twice round her lovely head like a coronet) entered the room, calm and majestic, except that there was a wrathful wrinkle on her rather prominent marble brow. With her imperturbable calm she did not begin to speak in front of the valet. She knew of the duel and had come to speak about it. She waited till the valet had set down the coffee things and left the room. Pierre looked at her timidly over his spectacles, and like a hare surrounded by hounds who lays back her ears and continues to crouch motionless before her enemies, he tried to continue reading. But feeling this to be senseless and impossible, he again glanced timidly at her. She did not sit down but looked at him with a contemptuous smile, waiting for the valet to go.

"Well, what's this now? What have you been up to now, I should like to know?" she asked sternly.

"I? What have I...?" stammered Pierre.

"So it seems you're a hero, eh? Come now, what was this duel about? What is it meant to prove? What? I ask you."

Pierre turned over heavily on the ottoman and opened his mouth, but could not reply.

"If you won't answer, I'll tell you..." Helene went on. "You believe everything you're told. You were told..." Helene laughed, "that Dolokhov was my lover," she said in French with her coarse plainness of speech, uttering the word amant as casually as any other word, "and you believed it! Well, what have you proved? What does this duel prove? That you're a fool, que vous etes un sot, but everybody knew that. What will be the result? That I shall be the laughingstock of all Moscow, that everyone will say that you, drunk and not knowing what you were about, challenged a man you are jealous of without cause." Helene raised her voice and became more and more excited, "A man who's a better man than you in every way..."

"Hm... Hm...!" growled Pierre, frowning without looking at her, and not moving a muscle.

"And how could you believe he was my lover? Why? Because I like his company? If you were cleverer and more agreeable, I should prefer yours."

"Don't speak to me... I beg you," muttered Pierre hoarsely.

"Why shouldn't I speak? I can speak as I like, and I tell you plainly that there are not many wives with husbands such as you who would not have taken lovers (des amants), but I have not done so," said she.

Pierre wished to say something, looked at her with eyes whose strange expression she did not understand, and lay down again. He was suffering physically at that moment, there was a weight on his chest and he could not breathe. He knew that he must do something to put an end to this suffering, but what he wanted to do was too terrible.

"We had better separate," he muttered in a broken voice.

"Separate? Very well, but only if you give me a fortune," said Helene. "Separate! That's a thing to frighten me with!"

Pierre leaped up from the sofa and rushed staggering toward her.

"I'll kill you!" he shouted, and seizing the marble top of a table with a strength he had never before felt, he made a step toward her brandishing the slab.

Helene's face became terrible, she shrieked and sprang aside. His father's nature showed itself in Pierre. He felt the fascination and delight of frenzy. He flung down the slab, broke it, and swooping down on her with outstretched hands shouted, "Get out!" in such a terrible voice that the whole house heard it with horror. God knows what he would have done at that moment had Helene not fled from the room.

A week later Pierre gave his wife full power to control all his estates in Great Russia, which formed the larger part of his property, and left for Petersburg alone.

CHAPTER VII

Two months had elapsed since the news of the battle of Austerlitz and the loss of Prince Andrew had reached Bald Hills, and in spite of the letters sent through the embassy and all the searches made, his body had not been found nor was he on the list of prisoners. What was worst of all for his relations was the fact that there was still a possibility of his having been picked up on the battlefield by the people of the place and that he might now be lying, recovering or dying, alone among strangers and unable to send news of himself. The gazettes from which the old prince first heard of the defeat at Austerlitz stated, as usual very briefly and vaguely, that after brilliant engagements the Russians had had to retreat and had made their withdrawal in perfect order. The old prince understood from this official report that our army had been defeated. A week after the gazette report of the battle of Austerlitz came a letter from Kutuzov informing the prince of the fate that had befallen his son.

"Your son," wrote Kutuzov, "fell before my eyes, a standard in his hand and at the head of a regiment--he fell as a hero, worthy of his father and his fatherland. To the great regret of myself and of the whole army it is still uncertain whether he is alive or not. I comfort myself and you with the hope that your son is alive, for otherwise he would have been mentioned among the officers found on the field of battle, a list of whom has been sent me under flag of truce."

After receiving this news late in the evening, when he was alone in his study, the old prince went for his walk as usual next morning, but he was silent with his steward, the gardener, and the architect, and though he looked very grim he said nothing to anyone.

When Princess Mary went to him at the usual hour he was working at his lathe and, as usual, did not look round at her.

"Ah, Princess Mary!" he said suddenly in an unnatural voice, throwing down his chisel. (The wheel continued to revolve by its own impetus, and Princess Mary long remembered the dying creak of that wheel, which merged in her memory with what followed.)

She approached him, saw his face, and something gave way within her. Her eyes grew dim. By the expression of her father's face, not sad,

not crushed, but angry and working unnaturally, she saw that hanging over her and about to crush her was some terrible misfortune, the worst in life, one she had not yet experienced, irreparable and incomprehensible--the death of one she loved.

"Father! Andrew!"--said the ungraceful, awkward princess with such an indescribable charm of sorrow and self-forgetfulness that her father could not bear her look but turned away with a sob.

"Bad news! He's not among the prisoners nor among the killed! Kutuzov writes..." and he screamed as piercingly as if he wished to drive the princess away by that scream... "Killed!"

The princess did not fall down or faint. She was already pale, but on hearing these words her face changed and something brightened in her beautiful, radiant eyes. It was as if joy--a supreme joy apart from the joys and sorrows of this world--overflowed the great grief within her. She forgot all fear of her father, went up to him, took his hand, and drawing him down put her arm round his thin, scraggy neck.

"Father," she said, "do not turn away from me, let us weep together."

"Scoundrels! Blackguards!" shrieked the old man, turning his face away from her. "Destroying the army, destroying the men! And why? Go, go and tell Lise."

The princess sank helplessly into an armchair beside her father and wept. She saw her brother now as he had been at the moment when he took leave of her and of Lise, his look tender yet proud. She saw him tender and amused as he was when he put on the little icon. "Did he believe? Had he repented of his unbelief? Was he now there? There in the realms of eternal peace and blessedness?" she thought.

"Father, tell me how it happened," she asked through her tears.

"Go! Go! Killed in battle, where the best of Russian men and Russia's glory were led to destruction. Go, Princess Mary. Go and tell Lise. I will follow."

When Princess Mary returned from her father, the little princess sat working and looked up with that curious expression of inner, happy calm peculiar to pregnant women. It was evident that her eyes did not see Princess Mary but were looking within... into herself... at something joyful and mysterious taking place within her.

"Mary," she said, moving away from the embroidery frame and lying back, "give me your hand." She took her sister-in-law's hand and held it below her waist.

Her eyes were smiling expectantly, her downy lip rose and remained lifted in childlike happiness.

Princess Mary knelt down before her and hid her face in the folds of her sister-in-law's dress.

"There, there! Do you feel it? I feel so strange. And do you know, Mary, I am going to love him very much," said Lise, looking with bright and happy eyes at her sister-in-law.

Princess Mary could not lift her head, she was weeping.

"What is the matter, Mary?"

"Nothing... only I feel sad... sad about Andrew," she said, wiping away her tears on her sister-in-law's knee.

Several times in the course of the morning Princess Mary began trying to prepare her sister-in-law, and every time began to cry. Unobservant as was the little princess, these tears, the cause of

which she did not understand, agitated her. She said nothing but looked about uneasily as if in search of something. Before dinner the old prince, of whom she was always afraid, came into her room with a peculiarly restless and malign expression and went out again without saying a word. She looked at Princess Mary, then sat thinking for a while with that expression of attention to something within her that is only seen in pregnant women, and suddenly began to cry.

"Has anything come from Andrew?" she asked.

"No, you know it's too soon for news. But my father is anxious and I feel afraid."

"So there's nothing?"

"Nothing," answered Princess Mary, looking firmly with her radiant eyes at her sister-in-law.

She had determined not to tell her and persuaded her father to hide the terrible news from her till after her confinement, which was expected within a few days. Princess Mary and the old prince each bore and hid their grief in their own way. The old prince would not cherish any hope: he made up his mind that Prince Andrew had been killed, and though he sent an official to Austria to seek for traces of his son, he ordered a monument from Moscow which he intended to erect in his own garden to his memory, and he told everybody that his son had been killed. He tried not to change his former way of life, but his strength failed him. He walked less, ate less, slept less, and became weaker every day. Princess Mary hoped. She prayed for her brother as living and was always awaiting news of his return.

CHAPTER VIII

"Dearest," said the little princess after breakfast on the morning of the nineteenth March, and her downy little lip rose from old habit, but as sorrow was manifest in every smile, the sound of every word, and even every footstep in that house since the terrible news had come, so now the smile of the little princess--influenced by the general mood though without knowing its cause--was such as to remind one still more of the general sorrow.

"Dearest, I'm afraid this morning's fruschtique*--as Foka the cook calls it--has disagreed with me."

*Fruhstuck: breakfast.

"What is the matter with you, my darling? You look pale. Oh, you are very pale!" said Princess Mary in alarm, running with her soft, ponderous steps up to her sister-in-law.

"Your excellency, should not Mary Bogdanovna be sent for?" said one of the maids who was present. (Mary Bogdanovna was a midwife from the neighboring town, who had been at Bald Hills for the last fortnight.)

"Oh yes," assented Princess Mary, "perhaps that's it. I'll go. Courage, my angel." She kissed Lise and was about to leave the room.

"Oh, no, no!" And besides the pallor and the physical suffering on the little princess' face, an expression of childish fear of inevitable pain showed itself.

"No, it's only indigestion?... Say it's only indigestion, say so,

Mary! Say..." And the little princess began to cry capriciously like a suffering child and to wring her little hands even with some affection. Princess Mary ran out of the room to fetch Mary Bogdanovna.

"Mon Dieu! Mon Dieu! Oh!" she heard as she left the room.

The midwife was already on her way to meet her, rubbing her small, plump white hands with an air of calm importance.

"Mary Bogdanovna, I think it's beginning!" said Princess Mary looking at the midwife with wide-open eyes of alarm.

"Well, the Lord be thanked, Princess," said Mary Bogdanovna, not hastening her steps. "You young ladies should not know anything about it."

"But how is it the doctor from Moscow is not here yet?" said the princess. (In accordance with Lise's and Prince Andrew's wishes they had sent in good time to Moscow for a doctor and were expecting him at any moment.)

"No matter, Princess, don't be alarmed," said Mary Bogdanovna.
"We'll manage very well without a doctor."

Five minutes later Princess Mary from her room heard something heavy being carried by. She looked out. The men servants were carrying the large leather sofa from Prince Andrew's study into the bedroom. On their faces was a quiet and solemn look.

Princess Mary sat alone in her room listening to the sounds in the house, now and then opening her door when someone passed and watching what was going on in the passage. Some women passing with quiet steps in and out of the bedroom glanced at the princess and turned away. She did not venture to ask any questions, and shut the door again, now sitting down in her easy chair, now taking her prayer book, now kneeling before the icon stand. To her surprise and distress she found that her prayers did not calm her excitement. Suddenly her door opened softly and her old nurse, Praskovya Savishna, who hardly ever came to that room as the old prince had forbidden it, appeared on the threshold with a shawl round her head.

"I've come to sit with you a bit, Masha," said the nurse, "and here I've brought the prince's wedding candles to light before his saint, my angel," she said with a sigh.

"Oh, nurse, I'm so glad!"

"God is merciful, birdie."

The nurse lit the gilt candles before the icons and sat down by the door with her knitting. Princess Mary took a book and began reading. Only when footsteps or voices were heard did they look at one another, the princess anxious and inquiring, the nurse encouraging. Everyone in the house was dominated by the same feeling that Princess Mary experienced as she sat in her room. But owing to the superstition that the fewer the people who know of it the less a woman in travail suffers, everyone tried to pretend not to know; no one spoke of it, but apart from the ordinary staid and respectful good manners habitual in the prince's household, a common anxiety, a softening of the heart, and a consciousness that something great and mysterious was being accomplished at that moment made itself felt.

There was no laughter in the maids' large hall. In the men servants' hall all sat waiting, silently and alert. In the outlying serfs' quarters torches and candles were burning and no one slept. The old prince, stepping on his heels, paced up and down his study and sent Tikhon to ask Mary Bogdanovna what news.--"Say only that 'the prince told me to ask,' and come and tell me her answer."

"Inform the prince that labor has begun," said Mary Bogdanovna, giving the messenger a significant look.

Tikhon went and told the prince.

"Very good!" said the prince closing the door behind him, and Tikhon did not hear the slightest sound from the study after that.

After a while he re-entered it as if to snuff the candles, and, seeing the prince was lying on the sofa, looked at him, noticed his perturbed face, shook his head, and going up to him silently kissed him on the shoulder and left the room without snuffing the candles or saying why he had entered. The most solemn mystery in the world continued its course. Evening passed, night came, and the feeling of suspense and softening of heart in the presence of the unfathomable did not lessen but increased. No one slept.

It was one of those March nights when winter seems to wish to resume its sway and scatters its last snows and storms with desperate fury. A relay of horses had been sent up the highroad to meet the German doctor from Moscow who was expected every moment, and men on horseback with lanterns were sent to the crossroads to guide him over the country road with its hollows and snow-covered pools of water.

Princess Mary had long since put aside her book: she sat silent, her luminous eyes fixed on her nurse's wrinkled face (every line of which she knew so well), on the lock of gray hair that escaped from under the kerchief, and the loose skin that hung under her chin.

Nurse Savishna, knitting in hand, was telling in low tones, scarcely hearing or understanding her own words, what she had told hundreds of times before: how the late princess had given birth to Princess Mary in Kishenev with only a Moldavian peasant woman to help instead of a midwife.

"God is merciful, doctors are never needed," she said.

Suddenly a gust of wind beat violently against the casement of the window, from which the double frame had been removed (by order of the prince, one window frame was removed in each room as soon as the larks returned), and, forcing open a loosely closed latch, set the damask curtain flapping and blew out the candle with its chill, snowy draft. Princess Mary shuddered; her nurse, putting down the stocking she was knitting, went to the window and leaning out tried to catch the open casement. The cold wind flapped the ends of her kerchief and her loose locks of gray hair.

"Princess, my dear, there's someone driving up the avenue!" she said, holding the casement and not closing it. "With lanterns. Most likely the doctor."

"Oh, my God! thank God!" said Princess Mary. "I must go and meet him, he does not know Russian."

Princess Mary threw a shawl over her head and ran to meet the newcomer. As she was crossing the anteroom she saw through the window a carriage with lanterns, standing at the entrance. She went out on the stairs. On a banister post stood a tallow candle which guttered in the draft. On the landing below, Philip, the footman, stood looking scared and holding another candle. Still lower, beyond the turn of the staircase, one could hear the footstep of someone in thick felt boots, and a voice that seemed familiar to Princess Mary was saying something.

"Thank God!" said the voice. "And Father?"

"Gone to bed," replied the voice of Demyan the house steward, who was downstairs.

Then the voice said something more, Demyan replied, and the steps in

the felt boots approached the unseen bend of the staircase more rapidly.

"It's Andrew!" thought Princess Mary. "No it can't be, that would be too extraordinary," and at the very moment she thought this, the face and figure of Prince Andrew, in a fur cloak the deep collar of which covered with snow, appeared on the landing where the footman stood with the candle. Yes, it was he, pale, thin, with a changed and strangely softened but agitated expression on his face. He came up the stairs and embraced his sister.

"You did not get my letter?" he asked, and not waiting for a reply--which he would not have received, for the princess was unable to speak--he turned back, rapidly mounted the stairs again with the doctor who had entered the hall after him (they had met at the last post station), and again embraced his sister.

"What a strange fate, Masha darling!" And having taken off his cloak and felt boots, he went to the little princess' apartment.

CHAPTER IX

The little princess lay supported by pillows, with a white cap on her head (the pains had just left her). Strands of her black hair lay round her inflamed and perspiring cheeks, her charming rosy mouth with its downy lip was open and she was smiling joyfully. Prince Andrew entered and paused facing her at the foot of the sofa on which she was lying. Her glittering eyes, filled with childlike fear and excitement, rested on him without changing their expression. "I love you all and have done no harm to anyone; why must I suffer so? Help me!" her look seemed to say. She saw her husband, but did not realize the significance of his appearance before her now. Prince Andrew went round the sofa and kissed her forehead.

"My darling!" he said--a word he had never used to her before.
"God is merciful...."

She looked at him inquiringly and with childlike reproach.

"I expected help from you and I get none, none from you either!" said her eyes. She was not surprised at his having come; she did not realize that he had come. His coming had nothing to do with her sufferings or with their relief. The pangs began again and Mary Bogdanovna advised Prince Andrew to leave the room.

The doctor entered. Prince Andrew went out and, meeting Princess Mary, again joined her. They began talking in whispers, but their talk broke off at every moment. They waited and listened.

"Go, dear," said Princess Mary.

Prince Andrew went again to his wife and sat waiting in the room next to hers. A woman came from the bedroom with a frightened face and became confused when she saw Prince Andrew. He covered his face with his hands and remained so for some minutes. Piteous, helpless, animal moans came through the door. Prince Andrew got up, went to the door, and tried to open it. Someone was holding it shut.

"You can't come in! You can't!" said a terrified voice from within.

He began pacing the room. The screaming ceased, and a few more seconds went by. Then suddenly a terrible shriek--it could not be hers, she could not scream like that--came from the bedroom. Prince Andrew ran to the door; the scream ceased and he heard the wail of an infant.

"What have they taken a baby in there for?" thought Prince Andrew in the first second. "A baby? What baby...? Why is there a baby there? Or is the baby born?"

Then suddenly he realized the joyful significance of that wail; tears choked him, and leaning his elbows on the window sill he began to cry, sobbing like a child. The door opened. The doctor with his shirt sleeves tucked up, without a coat, pale and with a trembling jaw, came out of the room. Prince Andrew turned to him, but the doctor gave him a bewildered look and passed by without a word. A woman rushed out and seeing Prince Andrew stopped, hesitating on the threshold. He went into his wife's room. She was lying dead, in the same position he had seen her in five minutes before and, despite the fixed eyes and the pallor of the cheeks, the same expression was on her charming childlike face with its upper lip covered with tiny black hair.

"I love you all, and have done no harm to anyone; and what have you done to me?" --said her charming, pathetic, dead face.

In a corner of the room something red and tiny gave a grunt and squealed in Mary Bogdanovna's trembling white hands.

Two hours later Prince Andrew, stepping softly, went into his father's room. The old man already knew everything. He was standing close to the door and as soon as it opened his rough old arms closed like a vise round his son's neck, and without a word he began to sob like a child.

Three days later the little princess was buried, and Prince Andrew went up the steps to where the coffin stood, to give her the farewell kiss. And there in the coffin was the same face, though with closed eyes. "Ah, what have you done to me?" it still seemed to say, and Prince Andrew felt that something gave way in his soul and that he was guilty of a sin he could neither remedy nor forget. He could not weep. The old man too came up and kissed the waxen little hands that lay quietly crossed one on the other on her breast, and to him, too, her face seemed to say: "Ah, what have you done to me, and why?" And at the sight the old man turned angrily away.

Another five days passed, and then the young Prince Nicholas Andreevich was baptized. The wet nurse supported the coverlet with her while the priest with a goose feather anointed the boy's little red and wrinkled soles and palms.

His grandfather, who was his godfather, trembling and afraid of dropping him, carried the infant round the battered tin font and handed him over to the godmother, Princess Mary. Prince Andrew sat in another room, faint with fear lest the baby should be drowned in the font, and awaited the termination of the ceremony. He looked up joyfully at the baby when the nurse brought it to him and nodded approval when she told him that the wax with the baby's hair had not sunk in the font but had floated.

CHAPTER X

Rostov's share in Dolokhov's duel with Bezukhov was hushed up by the efforts of the old count, and instead of being degraded to the ranks as he expected he was appointed an adjutant to the governor general of Moscow. As a result he could not go to the country with the rest of the family, but was kept all summer in Moscow by his new duties.

Dolokhov recovered, and Rostov became very friendly with him during his convalescence. Dolokhov lay ill at his mother's who loved him passionately and tenderly, and old Mary Ivanovna, who had grown fond of Rostov for his friendship to her Fedya, often talked to him about her son.

"Yes, Count," she would say, "he is too noble and pure-souled for our present, depraved world. No one now loves virtue; it seems like a reproach to everyone. Now tell me, Count, was it right, was it honorable, of Bezukhov? And Fedya, with his noble spirit, loved him and even now never says a word against him. Those pranks in Petersburg when they played some tricks on a policeman, didn't they do it together? And there! Bezukhov got off scotfree, while Fedya had to bear the whole burden on his shoulders. Fancy what he had to go through! It's true he has been reinstated, but how could they fail to do that? I think there were not many such gallant sons of the fatherland out there as he. And now--this duel! Have these people no feeling, or honor? Knowing him to be an only son, to challenge him and shoot so straight! It's well God had mercy on us. And what was it for? Who doesn't have intrigues nowadays? Why, if he was so jealous, as I see things he should have shown it sooner, but he lets it go on for months. And then to call him out, reckoning on Fedya not fighting because he owed him money! What baseness! What meanness! I know you understand Fedya, my dear count; that, believe me, is why I am so fond of you. Few people do understand him. He is such a lofty, heavenly soul!"

Dolokhov himself during his convalescence spoke to Rostov in a way no one would have expected of him.

"I know people consider me a bad man!" he said. "Let them! I don't care a straw about anyone but those I love; but those I love, I love so that I would give my life for them, and the others I'd throttle if they stood in my way. I have an adored, a priceless mother, and two or three friends--you among them--and as for the rest I only care about them in so far as they are harmful or useful. And most of them are harmful, especially the women. Yes, dear boy," he continued, "I have met loving, noble, high-minded men, but I have not yet met any women--countesses or cooks--who were not venal. I have not yet met that divine purity and devotion I look for in women. If I found such a one I'd give my life for her! But those!..." and he made a gesture of contempt. "And believe me, if I still value my life it is only because I still hope to meet such a divine creature, who will regenerate, purify, and elevate me. But you don't understand it."

"Oh, yes, I quite understand," answered Rostov, who was under his new friend's influence.

In the autumn the Rostovs returned to Moscow. Early in the winter Denisov also came back and stayed with them. The first half of the winter of 1806, which Nicholas Rostov spent in Moscow, was one of the happiest, merriest times for him and the whole family. Nicholas brought many young men to his parents' house. Vera was a handsome girl of twenty; Sonya a girl of sixteen with all the charm of an opening flower; Natasha, half grown up and half child, was now childishly amusing, now girlishly enchanting.

At that time in the Rostovs' house there prevailed an amorous atmosphere characteristic of homes where there are very young and very charming girls. Every young man who came to the house--seeing those impressionable, smiling young faces (smiling probably at their own happiness), feeling the eager bustle around him, and hearing the fitful bursts of song and music and the inconsequent but friendly prattle of young girls ready for anything and full of hope--experienced the same feeling; sharing with the young folk of the Rostovs' household a readiness to fall in love and an expectation of happiness.

Among the young men introduced by Rostov one of the first was Dolokhov, whom everyone in the house liked except Natasha. She

almost quarreled with her brother about him. She insisted that he was a bad man, and that in the duel with Bezukhov, Pierre was right and Dolokhov wrong, and further that he was disagreeable and unnatural.

"There's nothing for me to understand," cried out with resolute self-will, "he is wicked and heartless. There now, I like your Denisov though he is a rake and all that, still I like him; so you see I do understand. I don't know how to put it... with this one everything is calculated, and I don't like that. But Denisov..."

"Oh, Denisov is quite different," replied Nicholas, implying that even Denisov was nothing compared to Dolokhov--"you must understand what a soul there is in Dolokhov, you should see him with his mother. What a heart!"

"Well, I don't know about that, but I am uncomfortable with him. And do you know he has fallen in love with Sonya?"

"What nonsense..."

"I'm certain of it; you'll see."

Natasha's prediction proved true. Dolokhov, who did not usually care for the society of ladies, began to come often to the house, and the question for whose sake he came (though no one spoke of it) was soon settled. He came because of Sonya. And Sonya, though she would never have dared to say so, knew it and blushed scarlet every time Dolokhov appeared.

Dolokhov often dined at the Rostovs', never missed a performance at which they were present, and went to Togel's balls for young people which the Rostovs always attended. He was pointedly attentive to Sonya and looked at her in such a way that not only could she not bear his glances without coloring, but even the old countess and Natasha blushed when they saw his looks.

It was evident that this strange, strong man was under the irresistible influence of the dark, graceful girl who loved another.

Rostov noticed something new in Dolokhov's relations with Sonya, but he did not explain to himself what these new relations were. "They're always in love with someone," he thought of Sonya and Natasha. But he was not as much at ease with Sonya and Dolokhov as before and was less frequently at home.

In the autumn of 1806 everybody had again begun talking of the war with Napoleon with even greater warmth than the year before. Orders were given to raise recruits, ten men in every thousand for the regular army, and besides this, nine men in every thousand for the militia. Everywhere Bonaparte was anathematized and in Moscow nothing but the coming war was talked of. For the Rostov family the whole interest of these preparations for war lay in the fact that Nicholas would not hear of remaining in Moscow, and only awaited the termination of Denisov's furlough after Christmas to return with him to their regiment. His approaching departure did not prevent his amusing himself, but rather gave zest to his pleasures. He spent the greater part of his time away from home, at dinners, parties, and balls.

CHAPTER XI

On the third day after Christmas Nicholas dined at home, a thing he had rarely done of late. It was a grand farewell dinner, as he and Denisov were leaving to join their regiment after Epiphany.

About twenty people were present, including Dolokhov and Denisov.

Never had love been so much in the air, and never had the amorous atmosphere made itself so strongly felt in the Rostovs' house as at this holiday time. "Seize the moments of happiness, love and be loved! That is the only reality in the world, all else is folly. It is the one thing we are interested in here," said the spirit of the place.

Nicholas, having as usual exhausted two pairs of horses, without visiting all the places he meant to go to and where he had been invited, returned home just before dinner. As soon as he entered he noticed and felt the tension of the amorous air in the house, and also noticed a curious embarrassment among some of those present. Sonya, Dolokhov, and the old countess were especially disturbed, and to a lesser degree Natasha. Nicholas understood that something must have happened between Sonya and Dolokhov before dinner, and with the kindly sensitiveness natural to him was very gentle and wary with them both at dinner. On that same evening there was to be one of the balls that Iogel (the dancing master) gave for his pupils during the holidays.

"Nicholas, will you come to Iogel's? Please do!" said Natasha. "He asked you, and Vasili Dmitrich* is also going."

*Denisov.

"Where would I not go at the countess' command!" said Denisov, who at the Rostovs' had jocularly assumed the role of Natasha's knight. "I'm even ready to dance the pas de chale."

"If I have time," answered Nicholas. "But I promised the Arkharovs; they have a party."

"And you?" he asked Dolokhov, but as soon as he had asked the question he noticed that it should not have been put.

"Perhaps," coldly and angrily replied Dolokhov, glancing at Sonya, and, scowling, he gave Nicholas just such a look as he had given Pierre at the Club dinner.

"There is something up," thought Nicholas, and he was further confirmed in this conclusion by the fact that Dolokhov left immediately after dinner. He called Natasha and asked her what was the matter.

"And I was looking for you," said Natasha running out to him. "I told you, but you would not believe it," she said triumphantly. "He has proposed to Sonya!"

Little as Nicholas had occupied himself with Sonya of late, something seemed to give way within him at this news. Dolokhov was a suitable and in some respects a brilliant match for the dowerless, orphan girl. From the point of view of the old countess and of society it was out of the question for her to refuse him. And therefore Nicholas' first feeling on hearing the news was one of anger with Sonya.... He tried to say, "That's capital; of course she'll forget her childish promises and accept the offer," but before he had time to say it Natasha began again.

"And fancy! she refused him quite definitely!" adding, after a pause, "she told him she loved another."

"Yes, my Sonya could not have done otherwise!" thought Nicholas.

"Much as Mamma pressed her, she refused, and I know she won't change once she has said..."

"And Mamma pressed her!" said Nicholas reproachfully.

"Yes," said Natasha. "Do you know, Nicholas--don't be angry--but I know you will not marry her. I know, heaven knows how, but I know for certain that you won't marry her."

"Now don't know that at all!" said Nicholas. "But I must talk to her. What a darling Sonya is!" he added with a smile.

"Ah, she is indeed a darling! I'll send her to you."

And Natasha kissed her brother and ran away.

A minute later Sonya came in with a frightened, guilty, and scared look. Nicholas went up to her and kissed her hand. This was the first time since his return that they had talked alone and about their love.

"Sophie," he began, timidly at first and then more and more boldly, "if you wish to refuse one who is not only a brilliant and advantageous match but a splendid, noble fellow... he is my friend..."

Sonya interrupted him.

"I have already refused," she said hurriedly.

"If you are refusing for my sake, I am afraid that I..."

Sonya again interrupted. She gave him an imploring, frightened look.

"Nicholas, don't tell me that!" she said.

"No, but I must. It may be arrogant of me, but still it is best to say it. If you refuse him on my account, I must tell you the whole truth. I love you, and I think I love you more than anyone else...."

"That is enough for me," said Sonya, blushing.

"No, but I have been in love a thousand times and shall fall in love again, though for no one have I such a feeling of friendship, confidence, and love as I have for you. Then I am young. Mamma does not wish it. In a word, I make no promise. And I beg you to consider Dolokhov's offer," he said, articulating his friend's name with difficulty.

"Don't say that to me! I want nothing. I love you as a brother and always shall, and I want nothing more."

"You are an angel: I am not worthy of you, but I am afraid of misleading you."

And Nicholas again kissed her hand.

CHAPTER XII

Iogel's were the most enjoyable balls in Moscow. So said the mothers as they watched their young people executing their newly learned steps, and so said the youths and maidens themselves as they danced till they were ready to drop, and so said the grown-up young men and women who came to these balls with an air of condescension and found them most enjoyable. That year two marriages had come of these balls. The two pretty young Princesses Gorchakov met suitors there and were married and so further increased the fame of these dances. What distinguished them from others was the absence of host or hostess and the presence of the good-natured Iogel, flying about like a feather and bowing according to the rules of his art, as he

collected the tickets from all his visitors. There was the fact that only those came who wished to dance and amuse themselves as girls of thirteen and fourteen do who are wearing long dresses for the first time. With scarcely any exceptions they all were, or seemed to be, pretty--so rapturous were their smiles and so sparkling their eyes. Sometimes the best of the pupils, of whom Natasha, who was exceptionally graceful, was first, even danced the pas de chale, but at this last ball only the ecosseaise, the anglaise, and the mazurka, which was just coming into fashion, were danced. Iogel had taken a ballroom in Bezukhov's house, and the ball, as everyone said, was a great success. There were many pretty girls and the Rostov girls were among the prettiest. They were both particularly happy and gay. That evening, proud of Dolokhov's proposal, her refusal, and her explanation with Nicholas, Sonya twirled about before she left home so that the maid could hardly get her hair plaited, and she was transparently radiant with impulsive joy.

Natasha no less proud of her first long dress and of being at a real ball was even happier. They were both dressed in white muslin with pink ribbons.

Natasha fell in love the very moment she entered the ballroom. She was not in love with anyone in particular, but with everyone. Whatever person she happened to look at she was in love with for that moment.

"Oh, how delightful it is!" she kept saying, running up to Sonya.

Nicholas and Denisov were walking up and down, looking with kindly patronage at the dancers.

"How sweet she is--she will be a weal beauty!" said Denisov.

"Who?"

"Countess Natasha," answered Denisov.

"And how she dances! What gwace!" he said again after a pause.

"Who are you talking about?"

"About your sister," ejaculated Denisov testily.

Rostov smiled.

"My dear count, you were one of my best pupils--you must dance," said little Iogel coming up to Nicholas. "Look how many charming young ladies--" He turned with the same request to Denisov who was also a former pupil of his.

"No, my dear fellow, I'll be a wallflower," said Denisov. "Don't you wecollect what bad use I made of your lessons?"

"Oh no!" said Iogel, hastening to reassure him. "You were only inattentive, but you had talent--oh yes, you had talent!"

The band struck up the newly introduced mazurka. Nicholas could not refuse Iogel and asked Sonya to dance. Denisov sat down by the old ladies and, leaning on his saber and beating time with his foot, told them something funny and kept them amused, while he watched the young people dancing, Iogel with Natasha, his pride and his best pupil, were the first couple. Noiselessly, skillfully stepping with his little feet in low shoes, Iogel flew first across the hall with Natasha, who, though shy, went on carefully executing her steps. Denisov did not take his eyes off her and beat time with his saber in a way that clearly indicated that if he was not dancing it was because he would not and not because he could not. In the middle of a figure he beckoned to Rostov who was passing:

"This is not at all the thing," he said. "What sort of Polish mazuwka is this? But she does dance splendidly."

Knowing that Denisov had a reputation even in Poland for the masterly way in which he danced the mazurka, Nicholas ran up to Natasha:

"Go and choose Denisov. He is a real dancer, a wonder!" he said.

When it came to Natasha's turn to choose a partner, she rose and, tripping rapidly across in her little shoes trimmed with bows, ran timidly to the corner where Denisov sat. She saw that everybody was looking at her and waiting. Nicholas saw that Denisov was refusing though he smiled delightedly. He ran up to them.

"Please, Vasili Dmitrich," Natasha was saying, "do come!"

"Oh no, let me off, Countess," Denisov replied.

"Now then, Vaska," said Nicholas.

"They coax me as if I were Vaska the cat!" said Denisov jokingly.

"I'll sing for you a whole evening," said Natasha.

"Oh, the faiwy! She can do anything with me!" said Denisov, and he unhooked his saber. He came out from behind the chairs, clasped his partner's hand firmly, threw back his head, and advanced his foot, waiting for the beat. Only on horse back and in the mazurka was Denisov's short stature not noticeable and he looked the fine fellow he felt himself to be. At the right beat of the music he looked sideways at his partner with a merry and triumphant air, suddenly stamped with one foot, bounded from the floor like a ball, and flew round the room taking his partner with him. He glided silently on one foot half across the room, and seeming not to notice the chairs was dashing straight at them, when suddenly, clinking his spurs and spreading out his legs, he stopped short on his heels, stood so a second, stamped on the spot clanking his spurs, whirled rapidly round, and, striking his left heel against his right, flew round again in a circle. Natasha guessed what he meant to do, and abandoning herself to him followed his lead hardly knowing how. First he spun her round, holding her now with his left, now with his right hand, then falling on one knee he twirled her round him, and again jumping up, dashed so impetuously forward that it seemed as if he would rush through the whole suite of rooms without drawing breath, and then he suddenly stopped and performed some new and unexpected steps. When at last, smartly whirling his partner round in front of her chair, he drew up with a click of his spurs and bowed to her, Natasha did not even make him a curtsy. She fixed her eyes on him in amazement, smiling as if she did not recognize him.

"What does this mean?" she brought out.

Although Iogel did not acknowledge this to be the real mazurka, everyone was delighted with Denisov's skill, he was asked again and again as a partner, and the old men began smilingly to talk about Poland and the good old days. Denisov, flushed after the mazurka and mopping himself with his handkerchief, sat down by Natasha and did not leave her for the rest of the evening.

CHAPTER XIII

For two days after that Rostov did not see Dolokhov at his own or at Dolokhov's home: on the third day he received a note from him:

As I do not intend to be at your house again for reasons you know

of, and am going to rejoin my regiment, I am giving a farewell supper tonight to my friends--come to the English Hotel.

About ten o'clock Rostov went to the English Hotel straight from the theater, where he had been with his family and Denisov. He was at once shown to the best room, which Dolokhov had taken for that evening. Some twenty men were gathered round a table at which Dolokhov sat between two candles. On the table was a pile of gold and paper money, and he was keeping the bank. Rostov had not seen him since his proposal and Sonya's refusal and felt uncomfortable at the thought of how they would meet.

Dolokhov's clear, cold glance met Rostov as soon as he entered the door, as though he had long expected him.

"It's a long time since we met," he said. "Thanks for coming. I'll just finish dealing, and then Ilyushka will come with his chorus."

"I called once or twice at your house," said Rostov, reddening.

Dolokhov made no reply.

"You may punt," he said.

Rostov recalled at that moment a strange conversation he had once had with Dolokhov. "None but fools trust to luck in play," Dolokhov had then said.

"Or are you afraid to play with me?" Dolokhov now asked as if guessing Rostov's thought.

Beneath his smile Rostov saw in him the mood he had shown at the Club dinner and at other times, when as if tired of everyday life he had felt a need to escape from it by some strange, and usually cruel, action.

Rostov felt ill at ease. He tried, but failed, to find some joke with which to reply to Dolokhov's words. But before he had thought of anything, Dolokhov, looking straight in his face, said slowly and deliberately so that everyone could hear:

"Do you remember we had a talk about cards... 'He's a fool who trusts to luck, one should make certain,' and I want to try."

"To try his luck or the certainty?" Rostov asked himself.

"Well, you'd better not play," Dolokhov added, and springing a new pack of cards said: "Bank, gentlemen!"

Moving the money forward he prepared to deal. Rostov sat down by his side and at first did not play. Dolokhov kept glancing at him.

"Why don't you play?" he asked.

And strange to say Nicholas felt that he could not help taking up a card, putting a small stake on it, and beginning to play.

"I have no money with me," he said.

"I'll trust you."

Rostov staked five rubles on a card and lost, staked again, and again lost. Dolokhov "killed," that is, beat, ten cards of Rostov's running.

"Gentlemen," said Dolokhov after he had dealt for some time. "Please place your money on the cards or I may get muddled in the reckoning."

One of the players said he hoped he might be trusted.

"Yes, you might, but I am afraid of getting the accounts mixed. So I ask you to put the money on your cards," replied Dolokhov. "Don't stint yourself, we'll settle afterwards," he added, turning to Rostov.

The game continued; a waiter kept handing round champagne.

All Rostov's cards were beaten and he had eight hundred rubles scored up against him. He wrote "800 rubles" on a card, but while the waiter filled his glass he changed his mind and altered it to his usual stake of twenty rubles.

"Leave it," said Dolokhov, though he did not seem to be even looking at Rostov, "you'll win it back all the sooner. I lose to the others but win from you. Or are you afraid of me?" he asked again.

Rostov submitted. He let the eight hundred remain and laid down a seven of hearts with a torn corner, which he had picked up from the floor. He well remembered that seven afterwards. He laid down the seven of hearts, on which with a broken bit of chalk he had written "800 rubles" in clear upright figures; he emptied the glass of warm champagne that was handed him, smiled at Dolokhov's words, and with a sinking heart, waiting for a seven to turn up, gazed at Dolokhov's hands which held the pack. Much depended on Rostov's winning or losing on that seven of hearts. On the previous Sunday the old count had given his son two thousand rubles, and though he always disliked speaking of money difficulties had told Nicholas that this was all he could let him have till May, and asked him to be more economical this time. Nicholas had replied that it would be more than enough for him and that he gave his word of honor not to take anything more till the spring. Now only twelve hundred rubles was left of that money, so that this seven of hearts meant for him not only the loss of sixteen hundred rubles, but the necessity of going back on his word. With a sinking heart he watched Dolokhov's hands and thought, "Now then, make haste and let me have this card and I'll take my cap and drive home to supper with Denisov, Natasha, and Sonya, and will certainly never touch a card again." At that moment his home life, jokes with Petya, talks with Sonya, duets with Natasha, piquet with his father, and even his comfortable bed in the house on the Povarskaya rose before him with such vividness, clearness, and charm that it seemed as if it were all a lost and unappreciated bliss, long past. He could not conceive that a stupid chance, letting the seven be dealt to the right rather than to the left, might deprive him of all this happiness, newly appreciated and newly illumined, and plunge him into the depths of unknown and undefined misery. That could not be, yet he awaited with a sinking heart the movement of Dolokhov's hands. Those broad, reddish hands, with hairy wrists visible from under the shirt cuffs, laid down the pack and took up a glass and a pipe that were handed him.

"So you are not afraid to play with me?" repeated Dolokhov, and as if about to tell a good story he put down the cards, leaned back in his chair, and began deliberately with a smile:

"Yes, gentlemen, I've been told there's a rumor going about Moscow that I'm a sharper, so I advise you to be careful."

"Come now, deal!" exclaimed Rostov.

"Oh, those Moscow gossips!" said Dolokhov, and he took up the cards with a smile.

"Aah!" Rostov almost screamed lifting both hands to his head. The seven he needed was lying uppermost, the first card in the pack. He had lost more than he could pay.

"Still, don't ruin yourself!" said Dolokhov with a side glance at Rostov as he continued to deal.

CHAPTER XIV

An hour and a half later most of the players were but little interested in their own play.

The whole interest was concentrated on Rostov. Instead of sixteen hundred rubles he had a long column of figures scored against him, which he had reckoned up to ten thousand, but that now, as he vaguely supposed, must have risen to fifteen thousand. In reality it already exceeded twenty thousand rubles. Dolokhov was no longer listening to stories or telling them, but followed every movement of Rostov's hands and occasionally ran his eyes over the score against him. He had decided to play until that score reached forty-three thousand. He had fixed on that number because forty-three was the sum of his and Sonya's joint ages. Rostov, leaning his head on both hands, sat at the table which was scrawled over with figures, wet with spilled wine, and littered with cards. One tormenting impression did not leave him: that those broad-boned reddish hands with hairy wrists visible from under the shirt sleeves, those hands which he loved and hated, held him in their power.

"Six hundred rubles, ace, a corner, a nine... winning it back's impossible... Oh, how pleasant it was at home!... The knave, double or quits... it can't be!... And why is he doing this to me?" Rostov pondered. Sometimes he staked a large sum, but Dolokhov refused to accept it and fixed the stake himself. Nicholas submitted to him, and at one moment prayed to God as he had done on the battlefield at the bridge over the Enns, and then guessed that the card that came first to hand from the crumpled heap under the table would save him, now counted the cords on his coat and took a card with that number and tried staking the total of his losses on it, then he looked round for aid from the other players, or peered at the now cold face of Dolokhov and tried to read what was passing in his mind.

"He knows of course what this loss means to me. He can't want my ruin. Wasn't he my friend? Wasn't I fond of him? But it's not his fault. What's he to do if he has such luck?... And it's not my fault either," he thought to himself, "I have done nothing wrong. Have I killed anyone, or insulted or wished harm to anyone? Why such a terrible misfortune? And when did it begin? Such a little while ago I came to this table with the thought of winning a hundred rubles to buy that casket for Mamma's name day and then going home. I was so happy, so free, so lighthearted! And I did not realize how happy I was! When did that end and when did this new, terrible state of things begin? What marked the change? I sat all the time in this same place at this table, chose and placed cards, and watched those broad-boned agile hands in the same way. When did it happen and what has happened? I am well and strong and still the same and in the same place. No, it can't be! Surely it will all end in nothing!"

He was flushed and bathed in perspiration, though the room was not hot. His face was terrible and piteous to see, especially from its helpless efforts to seem calm.

The score against him reached the fateful sum of forty-three thousand. Rostov had just prepared a card, by bending the corner of which he meant to double the three thousand just put down to his score, when Dolokhov, slamming down the pack of cards, put it aside and began rapidly adding up the total of Rostov's debt, breaking the chalk as he marked the figures in his clear, bold hand.

"Supper, it's time for supper! And here are the gypsies!"

Some swarthy men and women were really entering from the cold outside and saying something in their gypsy accents. Nicholas understood that it was all over; but he said in an indifferent tone:

"Well, won't you go on? I had a splendid card all ready," as if it were the fun of the game which interested him most.

"It's all up! I'm lost!" thought he. "Now a bullet through my brain—that's all that's left me!" And at the same time he said in a cheerful voice:

"Come now, just this one more little card!"

"All right!" said Dolokhov, having finished the addition. "All right! Twenty-one rubles," he said, pointing to the figure twenty-one by which the total exceeded the round sum of forty-three thousand; and taking up a pack he prepared to deal. Rostov submissively unbent the corner of his card and, instead of the six thousand he had intended, carefully wrote twenty-one.

"It's all the same to me," he said. "I only want to see whether you will let me win this ten, or beat it."

Dolokhov began to deal seriously. Oh, how Rostov detested at that moment those hands with their short reddish fingers and hairy wrists, which held him in their power.... The ten fell to him.

"You owe forty-three thousand, Count," said Dolokhov, and stretching himself he rose from the table. "One does get tired sitting so long," he added.

"Yes, I'm tired too," said Rostov.

Dolokhov cut him short, as if to remind him that it was not for him to jest.

"When am I to receive the money, Count?"

Rostov, flushing, drew Dolokhov into the next room.

"I cannot pay it all immediately. Will you take an I.O.U.?" he said.

"I say, Rostov," said Dolokhov clearly, smiling and looking Nicholas straight in the eyes, "you know the saying, 'Lucky in love, unlucky at cards.' Your cousin is in love with you, I know."

"Oh, it's terrible to feel oneself so in this man's power," thought Rostov. He knew what a shock he would inflict on his father and mother by the news of this loss, he knew what a relief it would be to escape it all, and felt that Dolokhov knew that he could save him from all this shame and sorrow, but wanted now to play with him as a cat does with a mouse.

"Your cousin..." Dolokhov started to say, but Nicholas interrupted him.

"My cousin has nothing to do with this and it's not necessary to mention her!" he exclaimed fiercely.

"Then when am I to have it?"

"Tomorrow," replied Rostov and left the room.

CHAPTER XV

To say "tomorrow" and keep up a dignified tone was not difficult, but to go home alone, see his sisters, brother, mother, and father, confess and ask for money he had no right to after giving his word

of honor, was terrible.

At home, they had not yet gone to bed. The young people, after returning from the theater, had had supper and were grouped round the clavichord. As soon as Nicholas entered, he was enfolded in that poetic atmosphere of love which pervaded the Rostov household that winter and, now after Dolokhov's proposal and Iogel's ball, seemed to have grown thicker round Sonya and Natasha as the air does before a thunderstorm. Sonya and Natasha, in the light-blue dresses they had worn at the theater, looking pretty and conscious of it, were standing by the clavichord, happy and smiling. Vera was playing chess with Shinshin in the drawing room. The old countess, waiting for the return of her husband and son, sat playing patience with the old gentlewoman who lived in their house. Denisov, with sparkling eyes and ruffled hair, sat at the clavichord striking chords with his short fingers, his legs thrown back and his eyes rolling as he sang, with his small, husky, but true voice, some verses called "Enchantress," which he had composed, and to which he was trying to fit music:

Enchantress, say, to my forsaken lyre
What magic power is this recalls me still?
What spark has set my inmost soul on fire,
What is this bliss that makes my fingers thrill?

He was singing in passionate tones, gazing with his sparkling black-agate eyes at the frightened and happy Natasha.

"Splendid! Excellent!" exclaimed Natasha. "Another verse," she said, without noticing Nicholas.

"Everything's still the same with them," thought Nicholas, glancing into the drawing room, where he saw Vera and his mother with the old lady.

"Ah, and here's Nicholas!" cried Natasha, running up to him.

"Is Papa at home?" he asked.

"I am so glad you've come!" said Natasha, without answering him. "We are enjoying ourselves! Vasili Dmitrich is staying a day longer for my sake! Did you know?"

"No, Papa is not back yet," said Sonya.

"Nicholas, have you come? Come here, dear!" called the old countess from the drawing room.

Nicholas went to her, kissed her hand, and sitting down silently at her table began to watch her hands arranging the cards. From the dancing room, they still heard the laughter and merry voices trying to persuade Natasha to sing.

"All wight! All wight!" shouted Denisov. "It's no good making excuses now! It's your turn to sing the ba'cawolla--I entweat you!"

The countess glanced at her silent son.

"What is the matter?" she asked.

"Oh, nothing," said he, as if weary of being continually asked the same question. "Will Papa be back soon?"

"I expect so."

"Everything's the same with them. They know nothing about it! Where am I to go?" thought Nicholas, and went again into the dancing room where the clavichord stood.

Sonya was sitting at the clavichord, playing the prelude to Denisov's favorite barcarolle. Natasha was preparing to sing.

Denisov was looking at her with enraptured eyes.

Nicholas began pacing up and down the room.

"Why do they want to make her sing? How can she sing? There's nothing to be happy about!" thought he.

Sonya struck the first chord of the prelude.

"My God, I'm a ruined and dishonored man! A bullet through my brain is the only thing left me--not singing!" his thoughts ran on.
"Go away? But where to? It's one--let them sing!"

He continued to pace the room, looking gloomily at Denisov and the girls and avoiding their eyes.

"Nikolenka, what is the matter?" Sonya's eyes fixed on him seemed to ask. She noticed at once that something had happened to him.

Nicholas turned away from her. Natasha too, with her quick instinct, had instantly noticed her brother's condition. But, though she noticed it, she was herself in such high spirits at that moment, so far from sorrow, sadness, or self-reproach, that she purposely deceived herself as young people often do. "No, I am too happy now to spoil my enjoyment by sympathy with anyone's sorrow," she felt, and she said to herself: "No, I must be mistaken, he must be feeling happy, just as I am."

"Now, Sonya!" she said, going to the very middle of the room, where she considered the resonance was best.

Having lifted her head and let her arms droop lifelessly, as ballet dancers do, Natasha, rising energetically from her heels to her toes, stepped to the middle of the room and stood still.

"Yes, that's me!" she seemed to say, answering the rapt gaze with which Denisov followed her.

"And what is she so pleased about?" thought Nicholas, looking at his sister. "Why isn't she dull and ashamed?"

Natasha took the first note, her throat swelled, her chest rose, her eyes became serious. At that moment she was oblivious of her surroundings, and from her smiling lips flowed sounds which anyone may produce at the same intervals hold for the same time, but which leave you cold a thousand times and the thousand and first time thrill you and make you weep.

Natasha, that winter, had for the first time begun to sing seriously, mainly because Denisov so delighted in her singing. She no longer sang as a child, there was no longer in her singing that comical, childish, painstaking effect that had been in it before; but she did not yet sing well, as all the connoisseurs who heard her said: "It is not trained, but it is a beautiful voice that must be trained." Only they generally said this some time after she had finished singing. While that untrained voice, with its incorrect breathing and labored transitions, was sounding, even the connoisseurs said nothing, but only delighted in it and wished to hear it again. In her voice there was a virginal freshness, an unconsciousness of her own powers, and an as yet untrained velvety softness, which so mingled with her lack of art in singing that it seemed as if nothing in that voice could be altered without spoiling it.

"What is this?" thought Nicholas, listening to her with widely opened eyes. "What has happened to her? How she is singing today!" And suddenly the whole world centered for him on anticipation of the next note, the next phrase, and everything in the world was divided into three beats: "Oh mio crudele affetto.... One, two, three... one, two, three... One... "Oh mio crudele affetto.... One, two, three... One. "Oh, this senseless life of ours!" thought Nicholas. "All this

misery, and money, and Dolokhov, and anger, and honor--it's all nonsense... but this is real.... Now then, Natasha, now then, dearest! Now then, darling! How will she take that si? She's taken it! Thank God!" And without noticing that he was singing, to strengthen the si he sung a second, a third below the high note. "Ah, God! How fine! Did I really take it? How fortunate!" he thought.

Oh, how that chord vibrated, and how moved was something that was finest in Rostov's soul! And this something was apart from everything else in the world and above everything in the world. "What were losses, and Dolokhov, and words of honor?... All nonsense! One might kill and rob and yet be happy..."

CHAPTER XVI

It was long since Rostov had felt such enjoyment from music as he did that day. But no sooner had Natasha finished her barcarolle than reality again presented itself. He got up without saying a word and went downstairs to his own room. A quarter of an hour later the old count came in from his Club, cheerful and contented. Nicholas, hearing him drive up, went to meet him.

"Well--had a good time?" said the old count, smiling gaily and proudly at his son.

Nicholas tried to say "Yes," but could not: and he nearly burst into sobs. The count was lighting his pipe and did not notice his son's condition.

"Ah, it can't be avoided!" thought Nicholas, for the first and last time. And suddenly, in the most casual tone, which made him feel ashamed of himself, he said, as if merely asking his father to let him have the carriage to drive to town:

"Papa, I have come on a matter of business. I was nearly forgetting. I need some money."

"Dear me!" said his father, who was in a specially good humor. "I told you it would not be enough. How much?"

"Very much," said Nicholas flushing, and with a stupid careless smile, for which he was long unable to forgive himself, "I have lost a little, I mean a good deal, a great deal--forty three thousand."

"What! To whom?... Nonsense!" cried the count, suddenly reddening with an apoplectic flush over neck and nape as old people do.

"I promised to pay tomorrow," said Nicholas.

"Well!..." said the old count, spreading out his arms and sinking helplessly on the sofa.

"It can't be helped It happens to everyone!" said the son, with a bold, free, and easy tone, while in his soul he regarded himself as a worthless scoundrel whose whole life could not atone for his crime. He longed to kiss his father's hands and kneel to beg his forgiveness, but said, in a careless and even rude voice, that it happens to everyone!

The old count cast down his eyes on hearing his son's words and began bustlingly searching for something.

"Yes, yes," he muttered, "it will be difficult, I fear, difficult to raise... happens to everybody! Yes, who has not done it?"

And with a furtive glance at his son's face, the count went out of the room.... Nicholas had been prepared for resistance, but had not at all expected this.

"Papa! Pa-pa!" he called after him, sobbing, "forgive me!" And seizing his father's hand, he pressed it to his lips and burst into tears.

While father and son were having their explanation, the mother and daughter were having one not less important. Natasha came running to her mother, quite excited.

"Mamma!... Mamma!... He has made me..."

"Made what?"

"Made, made me an offer, Mamma! Mamma!" she exclaimed.

The countess did not believe her ears. Denisov had proposed. To whom? To this chit of a girl, Natasha, who not so long ago was playing with dolls and who was still having lessons.

"Don't, Natasha! What nonsense!" she said, hoping it was a joke.

"Nonsense, indeed! I am telling you the fact," said Natasha indignantly. "I come to ask you what to do, and you call it 'nonsense!'"

The countess shrugged her shoulders.

"If it true that Monsieur Denisov has made you a proposal, tell him he is a fool, that's all!"

"No, he's not a fool!" replied Natasha indignantly and seriously.

"Well then, what do you want? You're all in love nowadays. Well, if you are in love, marry him!" said the countess, with a laugh of annoyance. "Good luck to you!"

"No, Mamma, I'm not in love with him, I suppose I'm not in love with him."

"Well then, tell him so."

"Mamma, are you cross? Don't be cross, dear! Is it my fault?"

"No, but what is it, my dear? Do you want me to go and tell him?" said the countess smiling.

"No, I will do it myself, only tell me what to say. It's all very well for you," said Natasha, with a responsive smile. "You should have seen how he said it! I know he did not mean to say it, but it came out accidentally."

"Well, all the same, you must refuse him."

"No, I mustn't. I am so sorry for him! He's so nice."

"Well then, accept his offer. It's high time for you to be married," answered the countess sharply and sarcastically.

"No, Mamma, but I'm so sorry for him. I don't know how I'm to say it."

"And there's nothing for you to say. I shall speak to him myself," said the countess, indignant that they should have dared to treat this little Natasha as grown up.

"No, not on any account! I will tell him myself, and you'll listen at the door," and Natasha ran across the drawing room to the dancing

hall, where Denisov was sitting on the same chair by the clavichord with his face in his hands.

He jumped up at the sound of her light step.

"Nataly," he said, moving with rapid steps toward her, "decide my fate. It is in your hands."

"Vasili Dmitrich, I'm so sorry for you!... No, but you are so nice... but it won't do...not that... but as a friend, I shall always love you."

Denisov bent over her hand and she heard strange sounds she did not understand. She kissed his rough curly black head. At this instant, they heard the quick rustle of the countess' dress. She came up to them.

"Vasili Dmitrich, I thank you for the honor," she said, with an embarrassed voice, though it sounded severe to Denisov--"but my daughter is so young, and I thought that, as my son's friend, you would have addressed yourself first to me. In that case you would not have obliged me to give this refusal."

"Countess..." said Denisov, with downcast eyes and a guilty face. He tried to say more, but faltered.

Natasha could not remain calm, seeing him in such a plight. She began to sob aloud.

"Countess, I have done w'ong," Denisov went on in an unsteady voice, "but believe me, I so adore your daughter and all your family that I would give my life twice over..." He looked at the countess, and seeing her severe face said: "Well, good-by, Countess," and kissing her hand, he left the room with quick resolute strides, without looking at Natasha.

Next day Rostov saw Denisov off. He not wish to stay another day in Moscow. All Denisov's Moscow friends gave him a farewell entertainment at the gypsies', with the result that he had no recollection of how he was put in the sleigh or of the first three stages of his journey.

After Denisov's departure, Rostov spent another fortnight in Moscow, without going out of the house, waiting for the money his father could not at once raise, and he spent most of his time in the girls' room.

Sonya was more tender and devoted to him than ever. It was as if she wanted to show him that his losses were an achievement that made her love him all the more, but Nicholas now considered himself unworthy of her.

He filled the girls' albums with verses and music, and having at last sent Dolokhov the whole forty-three thousand rubles and received his receipt, he left at the end of November, without taking leave of any of his acquaintances, to overtake his regiment which was already in Poland.

BOOK FIVE: 1806 --07

CHAPTER I

After his interview with his wife Pierre left for Petersburg. At the Torzhok post station, either there were no horses or the postmaster would not supply them. Pierre was obliged to wait. Without undressing, he lay down on the leather sofa in front of a round table, put his big feet in their overboots on the table, and began to reflect.

"Will you have the portmanteaus brought in? And a bed got ready, and tea?" asked his valet.

Pierre gave no answer, for he neither heard nor saw anything. He had begun to think of the last station and was still pondering on the same question--one so important that he took no notice of what went on around him. Not only was he indifferent as to whether he got to Petersburg earlier or later, or whether he secured accommodation at this station, but compared to the thoughts that now occupied him it was a matter of indifference whether he remained there for a few hours or for the rest of his life.

The postmaster, his wife, the valet, and a peasant woman selling Torzhok embroidery came into the room offering their services. Without changing his careless attitude, Pierre looked at them over his spectacles unable to understand what they wanted or how they could go on living without having solved the problems that so absorbed him. He had been engrossed by the same thoughts ever since the day he returned from Sokolniki after the duel and had spent that first agonizing, sleepless night. But now, in the solitude of the journey, they seized him with special force. No matter what he thought about, he always returned to these same questions which he could not solve and yet could not cease to ask himself. It was as if the thread of the chief screw which held his life together were stripped, so that the screw could not get in or out, but went on turning uselessly in the same place.

The postmaster came in and began obsequiously to beg his excellency to wait only two hours, when, come what might, he would let his excellency have the courier horses. It was plain that he was lying and only wanted to get more money from the traveler.

"Is this good or bad?" Pierre asked himself. "It is good for me, bad for another traveler, and for himself it's unavoidable, because he needs money for food; the man said an officer had once given him a thrashing for letting a private traveler have the courier horses. But the officer thrashed him because he had to get on as quickly as possible. And I," continued Pierre, "shot Dolokhov because I considered myself injured, and Louis XVI was executed because they considered him a criminal, and a year later they executed those who executed him--also for some reason. What is bad? What is good? What should one love and what hate? What does one live for? And what am I? What is life, and what is death? What power governs all?"

There was no answer to any of these questions, except one, and that not a logical answer and not at all a reply to them. The answer was: "You'll die and all will end. You'll die and know all, or cease asking." But dying was also dreadful.

The Torzhok peddler woman, in a whining voice, went on offering her wares, especially a pair of goatskin slippers. "I have hundreds of rubles I don't know what to do with, and she stands in her tattered cloak looking timidly at me," he thought. "And what does she want the money for? As if that money could add a hair's breadth to happiness or peace of mind. Can anything in the world make her or me less a prey to evil and death?--death which ends all and must come today or tomorrow--at any rate, in an instant as compared with eternity." And again he twisted the screw with the stripped thread, and again it turned uselessly in the same place.

His servant handed him a half-cut novel, in the form of letters, by Madame de Souza. He began reading about the sufferings and virtuous struggles of a certain Emilie de Mansfeld. "And why did she resist her

seducer when she loved him?" he thought. "God could not have put into her heart an impulse that was against His will. My wife--as she once was--did not struggle, and perhaps she was right. Nothing has been found out, nothing discovered," Pierre again said to himself. "All we can know is that we know nothing. And that's the height of human wisdom."

Everything within and around him seemed confused, senseless, and repellent. Yet in this very repugnance to all his circumstances Pierre found a kind of tantalizing satisfaction.

"I make bold to ask your excellency to move a little for this gentleman," said the postmaster, entering the room followed by another traveler, also detained for lack of horses.

The newcomer was a short, large-boned, yellow-faced, wrinkled old man, with gray bushy eyebrows overhanging bright eyes of an indefinite grayish color.

Pierre took his feet off the table, stood up, and lay down on a bed that had been got ready for him, glancing now and then at the newcomer, who, with a gloomy and tired face, was wearily taking off his wraps with the aid of his servant, and not looking at Pierre. With a pair of felt boots on his thin bony legs, and keeping on a worn, nankeen-covered, sheepskin coat, the traveler sat down on the sofa, leaned back his big head with its broad temples and close-cropped hair, and looked at Bezukhov. The stern, shrewd, and penetrating expression of that look struck Pierre. He felt a wish to speak to the stranger, but by the time he had made up his mind to ask him a question about the roads, the traveler had closed his eyes. His shriveled old hands were folded and on the finger of one of them Pierre noticed a large cast iron ring with a seal representing a death's head. The stranger sat without stirring, either resting or, as it seemed to Pierre, sunk in profound and calm meditation. His servant was also a yellow, wrinkled old man, without beard or mustache, evidently not because he was shaven but because they had never grown. This active old servant was unpacking the traveler's canteen and preparing tea. He brought in a boiling samovar. When everything was ready, the stranger opened his eyes, moved to the table, filled a tumbler with tea for himself and one for the beardless old man to whom he passed it. Pierre began to feel a sense of uneasiness, and the need, even the inevitability, of entering into conversation with this stranger.

The servant brought back his tumbler turned upside down,* with an unfinished bit of nibbled sugar, and asked if anything more would be wanted.

*To indicate he did not want more tea.

"No. Give me the book," said the stranger.

The servant handed him a book which Pierre took to be a devotional work, and the traveler became absorbed in it. Pierre looked at him. All at once the stranger closed the book, putting in a marker, and again, leaning with his arms on the back of the sofa, sat in his former position with his eyes shut. Pierre looked at him and had not time to turn away when the old man, opening his eyes, fixed his steady and severe gaze straight on Pierre's face.

Pierre felt confused and wished to avoid that look, but the bright old eyes attracted him irresistibly.

"I have the pleasure of addressing Count Bezukhov, if I am not mistaken," said the stranger in a deliberate and loud voice.

Pierre looked silently and inquiringly at him over his spectacles.

"I have heard of you, my dear sir," continued the stranger, "and of your misfortune." He seemed to emphasize the last word, as if to say--"Yes, misfortune! Call it what you please, I know that what happened to you in Moscow was a misfortune."--"I regret it very much, my dear sir."

Pierre flushed and, hurriedly putting his legs down from the bed, bent forward toward the old man with a forced and timid smile.

"I have not referred to this out of curiosity, my dear sir, but for greater reasons."

He paused, his gaze still on Pierre, and moved aside on the sofa by way of inviting the other to take a seat beside him. Pierre felt reluctant to enter into conversation with this old man, but, submitting to him involuntarily, came up and sat down beside him.

"You are unhappy, my dear sir," the stranger continued. "You are young and I am old. I should like to help you as far as lies in my power."

"Oh, yes!" said Pierre, with a forced smile. "I am very grateful to you. Where are you traveling from?"

The stranger's face was not genial, it was even cold and severe, but in spite of this, both the face and words of his new acquaintance were irresistibly attractive to Pierre.

"But if for reason you don't feel inclined to talk to me," said the old man, "say so, my dear sir." And he suddenly smiled, in an unexpected and tenderly paternal way.

"Oh no, not at all! On the contrary, I am very glad to make your acquaintance," said Pierre. And again, glancing at the stranger's hands, he looked more closely at the ring, with its skull--a Masonic sign.

"Allow me to ask," he said, "are you a Mason?"

"Yes, I belong to the Brotherhood of the Freemasons," said the stranger, looking deeper and deeper into Pierre's eyes. "And in their name and my own I hold out a brotherly hand to you."

"I am afraid," said Pierre, smiling, and wavering between the confidence the personality of the Freemason inspired in him and his own habit of ridiculing the Masonic beliefs--"I am afraid I am very far from understanding--how am I to put it?--I am afraid my way of looking at the world is so opposed to yours that we shall not understand one another."

"I know your outlook," said the Mason, "and the view of life you mention, and which you think is the result of your own mental efforts, is the one held by the majority of people, and is the invariable fruit of pride, indolence, and ignorance. Forgive me, my dear sir, but if I had not known it I should not have addressed you. Your view of life is a regrettable delusion."

"Just as I may suppose you to be deluded," said Pierre, with a faint smile.

"I should never dare to say that I know the truth," said the Mason, whose words struck Pierre more and more by their precision and firmness. "No one can attain to truth by himself. Only by laying

stone on stone with the cooperation of all, by the millions of generations from our forefather Adam to our own times, is that temple reared which is to be a worthy dwelling place of the Great God," he added, and closed his eyes.

"I ought to tell you that I do not believe... do not believe in God," said Pierre, regretfully and with an effort, feeling it essential to speak the whole truth.

The Mason looked intently at Pierre and smiled as a rich man with millions in hand might smile at a poor fellow who told him that he, poor man, had not the five rubles that would make him happy.

"Yes, you do not know Him, my dear sir," said the Mason. "You cannot know Him. You do not know Him and that is why you are unhappy."

"Yes, yes, I am unhappy," assented Pierre. "But what am I to do?"

"You know Him not, my dear sir, and so you are very unhappy. You do not know Him, but He is here, He is in me, He is in my words, He is in thee, and even in those blasphemous words thou hast just uttered!" pronounced the Mason in a stern and tremulous voice.

He paused and sighed, evidently trying to calm himself.

"If He were not," he said quietly, "you and I would not be speaking of Him, my dear sir. Of what, of whom, are we speaking? Whom hast thou denied?" he suddenly asked with exulting austerity and authority in his voice. "Who invented Him, if He did not exist? Whence came thy conception of the existence of such an incomprehensible Being? didst thou, and why did the whole world, conceive the idea of the existence of such an incomprehensible Being, a Being all-powerful, eternal, and infinite in all His attributes?..."

He stopped and remained silent for a long time.

Pierre could not and did not wish to break this silence.

"He exists, but to understand Him is hard," the Mason began again, looking not at Pierre but straight before him, and turning the leaves of his book with his old hands which from excitement he could not keep still. "If it were a man whose existence thou didst doubt I could bring him to thee, could take him by the hand and show him to thee. But how can I, an insignificant mortal, show His omnipotence, His infinity, and all His mercy to one who is blind, or who shuts his eyes that he may not see or understand Him and may not see or understand his own vileness and sinfulness?" He paused again. "Who art thou? Thou dreamest that thou art wise because thou couldst utter those blasphemous words," he went on, with a somber and scornful smile. "And thou art more foolish and unreasonable than a little child, who, playing with the parts of a skillfully made watch, dares to say that, as he does not understand its use, he does not believe in the master who made it. To know Him is hard.... For ages, from our forefather Adam to our own day, we labor to attain that knowledge and are still infinitely far from our aim; but in our lack of understanding we see only our weakness and His greatness...."

Pierre listened with swelling heart, gazing into the Mason's face with shining eyes, not interrupting or questioning him, but believing with his whole soul what the stranger said. Whether he accepted the wise reasoning contained in the Mason's words, or believed as a child believes, in the speaker's tone of conviction and earnestness, or the tremor of the speaker's voice--which sometimes almost broke--or those brilliant aged eyes grown old in this conviction, or the calm firmness and certainty of his vocation, which radiated from his whole being (and which struck Pierre especially by contrast with his own dejection and hopelessness)--at any rate, Pierre longed with his whole soul to believe and he did believe, and felt a joyful sense of comfort, regeneration, and

return to life.

"He is not to be apprehended by reason, but by life," said the Mason.

"I do not understand," said Pierre, feeling with dismay doubts reawakening. He was afraid of any want of clearness, any weakness, in the Mason's arguments; he dreaded not to be able to believe in him. "I don't understand," he said, "how it is that the mind of man cannot attain the knowledge of which you speak."

The Mason smiled with his gentle fatherly smile.

"The highest wisdom and truth are like the purest liquid we may wish to imbibe," he said. "Can I receive that pure liquid into an impure vessel and judge of its purity? Only by the inner purification of myself can I retain in some degree of purity the liquid I receive."

"Yes, yes, that is so," said Pierre joyfully.

"The highest wisdom is not founded on reason alone, not on those worldly sciences of physics, history, chemistry, and the like, into which intellectual knowledge is divided. The highest wisdom is one. The highest wisdom has but one science--the science of the whole--the science explaining the whole creation and man's place in it. To receive that science it is necessary to purify and renew one's inner self, and so before one can know, it is necessary to believe and to perfect one's self. And to attain this end, we have the light called conscience that God has implanted in our souls."

"Yes, yes," assented Pierre.

"Look then at thy inner self with the eyes of the spirit, and ask thyself whether thou art content with thyself. What hast thou attained relying on reason only? What art thou? You are young, you are rich, you are clever, you are well educated. And what have you done with all these good gifts? Are you content with yourself and with your life?"

"No, I hate my life," Pierre muttered, wincing.

"Thou hatest it. Then change it, purify thyself; and as thou art purified, thou wilt gain wisdom. Look at your life, my dear sir. How have you spent it? In riotous orgies and debauchery, receiving everything from society and giving nothing in return. You have become the possessor of wealth. How have you used it? What have you done for your neighbor? Have you ever thought of your tens of thousands of slaves? Have you helped them physically and morally? No! You have profited by their toil to lead a profligate life. That is what you have done. Have you chosen a post in which you might be of service to your neighbor? No! You have spent your life in idleness. Then you married, my dear sir--took on yourself responsibility for the guidance of a young woman; and what have you done? You have not helped her to find the way of truth, my dear sir, but have thrust her into an abyss of deceit and misery. A man offended you and you shot him, and you say you do not know God and hate your life. There is nothing strange in that, my dear sir!"

After these words, the Mason, as if tired by his long discourse, again leaned his arms on the back of the sofa and closed his eyes. Pierre looked at that aged, stern, motionless, almost lifeless face and moved his lips without uttering a sound. He wished to say, "Yes, a vile, idle, vicious life!" but dared not break the silence.

The Mason cleared his throat huskily, as old men do, and called his servant.

"How about the horses?" he asked, without looking at Pierre.

"The exchange horses have just come," answered the servant. "Will you not rest here?"

"No, tell them to harness."

"Can he really be going away leaving me alone without having told me all, and without promising to help me?" thought Pierre, rising with downcast head; and he began to pace the room, glancing occasionally at the Mason. "Yes, I never thought of it, but I have led a contemptible and profligate life, though I did not like it and did not want to," thought Pierre. "But this man knows the truth and, if he wished to, could disclose it to me."

Pierre wished to say this to the Mason, but did not dare to. The traveler, having packed his things with his practiced hands, began fastening his coat. When he had finished, he turned to Bezukhov, and said in a tone of indifferent politeness:

"Where are you going to now, my dear sir?"
